Mr. Clark, Shoreditch, said he would like the conference to place on record their emphatic protest against the hindrances placed in their way by central authorities. He was convinced if the Local Government Board were as sincere and earnest as members of Parliament tried to make out, they would be able to get on very much quicker. Another difficulty had recently arisen in connection with another scheme the Council of Shoreditch were endeavouring to do. In order to enable them to make the best possible use of the land and give the working people the benefit of cheaper dwellings, they proposed to let shops in the property. The Local Government Board refused to sanction that, so instead of the working classes having to pay 15*s.* per week they would require to pay 24*s.* He mentioned that fact to show how impossible it was for municipalities to

the best intentions to carry out work of that kind. He disagreed with the idea that it was possible to improve the slums in London, as he believed the only cure for these was to sweep them away. There were two separate lines on which to act. The first was to act under the Public Health Act with a clearance scheme, and the other was to go on with a housing scheme for the poorer classes.

Mr. D. S. Waterlow, chairman of the housing and working-classes committee of London County Council, remarked that they could very well do in the Metropolis with a few thousand Miss Octavia Hills. The gentleman who mentioned her work, quoting from a report on Miss Hill's work, said that if they could buy land at 45s. per square yard they could house people in London in a tolerably satisfactory manner. These figures were more or less accurate. But what Mr. Harrison did not mention was that it was impossible in the more crowded and central areas of London to acquire land at anything like that price. As a rule the London County Council had to pay for clearing an insanitary area between 15s. and 17s. per square foot, and when it was cleared it was worth for ordinary commercial purposes in the more crowded and central parts of London, roughly, 10s. per square foot, and for housing purposes 15s. per square foot. As to the sinking fund, he urged that they should have an extension even beyond sixty years, the period in London. On block dwellings the period should be eighty or one hundred years, and they should have exemption from sinking fund on the land until after the buildings were paid off. As to insanitary property, he quoted an instance in Hackney in which a widow's rent had been raised from 6s. to 8s. and then to 10s. a week for two abominable rooms, and the tenant stated she was unable to remove as there was no other accommodation available. If they acquired that area as insanitary under the Housing of the Working Classes Act they would probably have to pay on the basis of the final rent charged apart from compensation for removal. It was not fair that a man should have such power, and if some method could be devised to meet that difficulty it would be extremely valuable.

Councillor Steele, who presided in the temporary absence of the Lord Provost, mentioned that in Glasgow sixty years was the term for repayment both of land and property.

Mr. Fildes, of the sanitary committee of Manchester, said that they must admit that voluntary effort so far had done what municipalities had not been able to do. Private effort could do about quietly seeking plots of land, and get them at a reasonable price, but owners when they heard a Corporation had

fixed upon a particular plot put up the price to an almost unbuyable figure. Companies in London, Glasgow and Manchester were all dividend-paying concerns, and they wanted to show that corporate bodies could follow on similar lines, which meant that nothing would have to be paid out of the rates. He was against the Corporation management of properties acquired by voluntary effort.

Councillor Page, Plymouth, said that in that borough they had spent 100,000*l.*, but they had failed in dealing with the housing question so far as the wage-earners of 1*l.* a week were concerned. They had purchased land at 6*d.* a foot, but on account of the stringent by-laws of the Local Government Board they had failed to provide accommodation for the class to whom he had referred. The houses they had erected could be occupied only by men who were earning from 30s. to 40s. a week. Private owners did not look for a sinking fund—they were content with the value of the property. He thought municipal corporations should take a leaf out of their books.

Bailie W. F. Anderson said if they were to provide cheap houses for the people, the first thing they must do was to get cheap land. He did not understand why Government should give County Councils power to acquire land compulsorily at valuation to bury the dead, and yet fail to give them a similar power to house the living. Then, again, if Government gave powers to acquire land with insanitary property upon it, why would they not give them power to acquire unoccupied land? The Glasgow Corporation had power to extend repayment of loans over a period of sixty years, and why should the English municipalities be hampered by the Local Government Board? Then he saw no necessity for a sinking fund for the purchase of the land. The days were past when people could steal the land. In populous centres experience was that land became more valuable. Then with regard to the remarks of Mr. Waterlow as to the character of the insanitary property in Hackney, he asked why such property should not be shut up? By the system which existed a premium was put on slum property. Insanitary property should be demolished, and local authorities should have power to take the land at a fair valuation. He quoted the power contained in the Glasgow Local Act, and suggested that their English friends should follow the example of Glasgow, and get private Acts for themselves.

Mr. Taylor, L.C.C., said he thought the freeholder should be made responsible for the condition of slum property. He held further that local authorities should have power to buy

lands in advance, as, for instance, with a view to tramway extension. The London County Council had paid no less than 100,000*l.* per acre for land, and had erected houses for the working classes costing at the rate of 100*l.* per head.

Dr. Scourfield, Sunderland, asked whether the Glasgow authorities had been able by the buildings which they had erected to solve the question of dealing with the class referred to by Mr. Page—the class who earned 20*s.* a week.

Councillor Mitchell, Greenock, asked if any practical result was to come of the discussion.

The Chairman (ex-Bailie Steele) said that to-morrow at the close of the conference a series of resolutions would be submitted for consideration of the delegates.

Mr. Gray and Mr. Burt then replied on the discussion. In the course of his remarks Mr. Burt said that Mr. M'Donald had described a building which might be fit for a doghouse, and he would not trouble himself with the matter if the outcome of all their discussion was to be the erection of such miserable dwellings for the people.

The Chairman said that although in Glasgow they had been striving to do a great deal, they were satisfied they had not solved the question of dealing with the class to whom Dr. Scourfield referred. They had erected cheap houses, but the fact that they had called the conference was an evidence that they were not satisfied.

The Congress adjourned for luncheon, and on resuming a representative committee was appointed to draft a resolution embodying the views expressed, to be submitted to the conference.

Papers were also read on "Caretaking of Property," "How to Clear Congested Areas," "Farmed-out Houses," "Slum Properties," "Hygienic Requirements of Building," "Cheap Means of Communication."

The following resolutions were adopted:—

1. That this Congress is of opinion that the better housing and the providing of cheaply-constructed, but improved dwellings for the population, and also of those to be displaced by the closing up and demolition of slum properties in unhealthy and congested areas are questions which call for urgent action on the part of municipal corporations and other local authorities within the United Kingdom, and that the time has now come when more extensive and unfettered powers than those which the Legislature has hitherto granted should be conferred upon municipal corporations and other local authorities in relation to such questions.

2. That for the purpose of enabling municipal corporations and other local authorities throughout the United Kingdom to deal expeditiously and effectively with the better housing, the closing up and demolition of slum properties in unhealthy and congested areas, and the providing of cheap but improved dwellings for the accommodation of the population, and also of those to be thereby displaced, and to purchase the land and borrow the capital moneys required for the objects indicated, this Congress is also unanimously of opinion that further and immediate general or private bill legislation is necessary and expedient in the directions following, viz.:—(1) That simpler and less costly machinery should be devised and sanctioned by Parliament for enabling local authorities to put in force and carry out the provisions of the Housing of the Working Classes Acts; (2) That authority should be given to municipal corporations and other local authorities to acquire, at its market value, by as simple and inexpensive a method as possible, and without any allowance for compulsory purchase, land for the present or prospective erection and maintenance of dwellings for the population to be displaced by the abolition of slum properties; (3) That any sinking fund required to be set apart for repayment of moneys borrowed for such purposes should apply to the cost of buildings only and not to land, and should be extended over a period of not less than sixty years; and (4) That municipal corporations and other local authorities be empowered to build such buildings in accordance with their own by-laws, and not be required to satisfy the requirements of the Local Government Board.

3. That a joint representative committee be appointed by this Congress for the purpose of adopting such measures as may be deemed requisite or expedient for bringing the several matters referred to in the first and second resolutions under the consideration of Parliament, and for obtaining remedial and supplementary legislation thereon.

The committee was then appointed as follows:—Glasgow, the Lord Provost of Glasgow, Mr. Samuel Chisholm, LL.D., Councillors Steele and Gray; Edinburgh, Bailie W. S. Brown, Dean of Guild Ormiston; Dundee, Bailie Elliot; Aberdeen, Councillor Cooper; Plymouth, Councillor Page; London, Mr. D. S. Waterlow and Mr. R. Y. Taylor; Manchester, Alderman M'Dougall and Councillor Fildes; Liverpool, Councillors M'Guffie and Colton; Newcastle, Alderman Newton; Sheffield, Alderman Carter; Dublin, Alderman Wm. Doyle; Sunderland, Alderman Harrison; Leeds, Alderman Lupton; Leicester, Councillor Walters—the Lord Provost of Glasgow convener.

The Architect.

THE WEEK.

NEARLY five years have elapsed since we commenced the continuous publication of illustrations of the English cathedrals. At the time Gothic was believed to be almost completely obsolete as a style, especially for modern buildings. There was, however, little difficulty in reviving the admiration for a variety of architecture which had more claims to be considered national than any of those which had been superseding it. The success we obtained encouraged us to proceed, and for the first time the English cathedrals were represented with an amplitude that had not been hitherto attempted. There was no effort to exalt the details beyond their genuine character, for the photographic process could only render masons' and stonecutters' work with fidelity. From the communications we received from time to time we have been gratified to find that the influence exerted by our series has been extensive. Gothic, as displayed in nearly twenty cathedrals and in Westminster Abbey, has been repopularised not only in this country, but in the colonies and in the United States. As a sign of the new revival of admiration for English work it is satisfactory to learn that the committee for the contemplated Liverpool cathedral have further shown their wisdom by deciding that the building is to be in the Gothic style. It seems to us almost incomprehensible that anyone should have anticipated the adoption of a different style. With the exception of St. Paul's all the cathedrals of England are Gothic buildings, and it would be unworthy of so conservative a city as Liverpool to show less respect for the national architecture of the country than the people of Truro some years back. St. Paul's is not Gothic for two reasons. First, WREN was not an admirer of the style, and, secondly, it was anticipated that the building would be used for a ritual different from that followed in the other cathedrals. But in our time there are no difficulties of that kind. Nor can it be said that the Gothic style is unfitted for the services which will be held in the new cathedral. The style is one which is most adaptable, and the business men who form the committee are not likely to approve of plans which are unfitted to meet the requirements of congregations. The question is not whether Gothic or Renaissance is better adapted for ordinary use. It is simply whether a custom that has prevailed for over 700 years should be set aside through a desire for novelty and a weakness for experimenting.

ONE effect of the taxation of gardens and open spaces in Paris will be the transformation of "La Murette" at Passy—ground which at one time was a royal property. It adjoins the Bois de Boulogne and has had an interesting history. It now belongs to M. de FRANQUEVILLE, the president of the Institut. Having found that he would have to pay 100,000 francs a year for a property that he only occasionally occupied, he has decided that he will abandon "La Murette," and the beautiful grounds will be sold in lots for building unless the State can acquire the possession. The district of Passy is crowded with villas, and "La Murette" was the last open space belonging to a private owner that was found in that part of Paris. As royal property "La Murette" was sold in 1803 to SEBASTIAN ERARD, the maker of pianos. When LOUIS XVIII. came to the throne M. ERARD offered to restore the property to him, but the king would not accept it. At the present owner's invitation it was often visited during late years by the savants, scholars and artists of Paris.

As the time is drawing nigh for the opening of the Salle in the Louvre, which is to contain the invaluable examples of goldsmiths' work presented to France by the late Baron ADOLPHE DE ROTHSCHILD, the eagerness of the public is becoming more urgent. It is, however, doubtful whether the collections can be seen in the present year.

The Salle has to be put in a condition befitting the precious contents. The ceiling will be covered with one of carved wood, which was purchased in Venice. The floor will be in elaborate parquetry, and the walls hung with Flemish tapestry and other costly stuffs. It is doubtful whether any gallery in the world will be able to display so many examples of genuine art in the precious metals. One of the latest additions comes from the Baroness ADOLPHE, who has presented a Venetian reliquary in gold of the fifteenth century, and which, on account of the beauty of the details, is of untold value.

IT seems incredible that so important a public memorial as that erected in honour of the late Prince CONSORT in Hyde Park should be neglected. The London atmosphere is no respecter of persons or works of art, and the Albert Memorial appears to be destined to the common deterioration. Only thirty years have elapsed since it was completed, and yet Mr. R. M. BEACHCROFT has reported that during a visit on Sunday last a shower of mosaic from one of the gables fell at his feet. He was also informed that such a fall is of frequent occurrence. Some of the statuettes have been already disfigured owing to the softness of the marble, and the railing and gates are in a neglected condition. So elaborate a structure was unfitted to be placed in the open air of London. The delicate detail and the variety of materials employed appear to offer facilities for the inevitable process of disintegration, and only good work could have stood so long. On the other hand, it should be remembered that restoration is particularly difficult. Scaffolding would be regarded as an eyesore, and it would not be easy to employ a movable platform, from which reparation would be practicable as soon as needed, and which could be taken away when the work was executed. The Memorial, however, deserves careful attention. When decay once begins, it is apt to advance with unsatisfactory speed, and, in order to preserve a work in which so many artists co-operated, it may be necessary to enclose the Memorial in a shrine of glass, which would not be inappropriate in Hyde Park.

FROM the official report of the Ontario Bureau of Mines it appears there was an increase of 67,069 dols. in the value of the building materials produced during 1900 over those of 1899, the amounts for the respective years being 2,688,351 dols. and 2,621,282 dols. Part of the increase may be attributed to a rise in prices. There was much more Portland cement manufactured in 1900, the amount being increased by 70,117 barrels of the value of 136,749 dols. During 1900 cement to the value of 249,280 dols. was imported from Great Britain, Belgium coming next, the amount being 156,213 dols. The cement from the United States is not prized in Canada, for the value of the imports was 55,569 dols., being less than Germany. In 1899 the value of the British cement was 125,778 dols., the import was therefore nearly doubled during last year. It is pointed out, however, that as about 270,000 tons of cement, principally from Belgium, is used in Great Britain, the gain in Canada is balanced by the diminution of the home trade.

A SOCIETY has been founded at Glasgow under the title of "The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society," which is to consist of students who have attended any of the courses of building construction or of the architectural classes of the college. The annual subscription is fixed at the small sum of 2s. 6d. a year. The meetings will begin to-day, when Mr. M'KISSACK, the president, will deliver an address. Papers on the following subjects will be discussed during the session:—"The Housing Problem," "Timber," "Foreign Competition in the Building Trades," "Hotel Planning and Construction," "Tiles," "The Highlands of Central Europe," "Hospital Planning and Construction—Stone and Brick," "The Renaissance of Scotland," "Glasgow International Exhibition, 1901," "Prevention of Damp in Walls," "The Sewage Disposal of a Country House."

THE LATE JAMES BROOKS.

WHEN it was supposed that the competition for the contemplated cathedral at Liverpool was to be limited to six architects who were practised in the Gothic style, it was generally agreed by those who discussed the subject that JAMES BROOKS would be one of the first to be selected. He had taken part in the former competition and had produced an impressive design. He was, however, destined not to share in any more architectural contests, for on Monday last he died at his house in Stoke Newington. As he was born in 1825 he was in his seventy-sixth year.

JAMES BROOKS could be described as belonging to the old-fashioned race of architects. He was essentially a

cachet in the disposition which prevented them from being confounded with the numerous Gothic examples that were to be found in the district. The other buildings were more in keeping with precedents. It was not difficult to say whence a certain doorway, or window, or steeple was derived. Men who were faithful to models or parts of models sometimes would say that JAMES BROOKS's works were less "pure" than their own; and he would himself agree with them. The truth was he did not believe in extracts, however elegant. His mind was infused with the Gothic spirit, and he no more cared to be considered a faithful imitator of ancient examples of architecture than of the phrases of CHAUCER or GOWER in his everyday speech.

What seemed to him to be the first requirement in

Photo by Elliott & Fry.

THE LATE JAMES BROOKS.

modest man, and shrank from opportunities for taking a prominent place in the eyes of the public. He never appeared to be desirous of impressing a stranger with the belief that he was called upon to do a great work, and was endowed with the abilities which were necessary for its completion. And yet it could not be denied that his buildings, and especially his churches, have a place apart in the architecture of our time. Country architects who went in search of his work in the east and north-east of London used to say they did not require to ask whereabouts in the out-of-the-way region were the churches they sought. They were recognisable at a distant or partial view. The buildings often appeared to be unfinished and over plain, but there was an unmistakable

dealing with commissions was to realise the intentions of those who were, to use a common phrase, "getting up" a church. We may be in error, but we have often fancied that JAMES BROOKS was not unwilling to make a sacrifice of his art if he imagined a more spiritual effect could be produced on beholders by means of another and inferior art. There are churches where the outlay on the chancel and its altar was out of proportion if judged by the ordinary scale. But if the worshippers, and especially the poorer among them, were more moved by the costly adornment of one particular spot, and were helped through their emotions in concentrating their attention upon it, the late architect would go as far as possible in carrying out that arrangement.

He realised that an effort was being made in districts

which were almost benighted, and in which the Established Church was a legal but unattractive power, to convince the people that a new manifestation of spirit was abroad, and which could exercise a benignant influence in edifying them; that is, in building them up for a new life, and in that work JAMES BROOKS was one of the most potent instruments. In his churches there appears to be an immanent relation between all the parts and the uses which they had to subserve. When we remember that the means at the architect's disposal were usually limited in amount and that the buildings had to be capacious, the results he attained are most remarkable.

There is always more or less risk when an architect succeeds in some great undertaking, and thus one often hears men who are envied complaining that the prosperity they had contemplated at one time had not arrived for them. JAMES BROOKS was able to accomplish more than his clients expected, and if art can be of any real use his buildings must have exercised some civilising power over masses of people who amidst their ordinary surroundings seemed doomed to be brutalised. The conclusion was, however, drawn by people who could afford to spend liberally on architecture that he was best adapted to design large, uncommon and cheap churches for semi-barbarous districts. Commissions for buildings in which it was not necessary, as it were, to count every penny, did not reach his hands so frequently as they came to men who cared little about the ecclesiastical provision for the poor and avoided meddling with the subject. It might even be imagined there was apprehension that JAMES BROOKS would have brought some of the characteristics of East-end congregations to churches which were to be costly if he were entrusted with the designing of them.

Hereafter, no doubt, it will be admitted that he loyally served a great cause, and devoted the whole strength of his powers to what he believed were the interests of the poorest classes of humanity. In spite of all the impediments which arose from the poverty of the districts, he contrived to raise buildings which the most fastidious critic must respect, and in which the scoffer feels impressed by the simple yet lofty character which they declare. Certainly no modern churches in London have received more careful study from his younger contemporaries than those with which JAMES BROOKS enriched Shoreditch and Hoxton. In other districts there is less of a contrast, and the endeavour of the architect is therefore less plain. It would have been an advantage if more of his buildings were to be seen throughout England, but enough of them exist to testify to his genius as an architect, and his zeal for the promotion of Christianity.

EARLY RENAISSANCE.*

WE may compare Mr. GOTCH's latest volume to a memoir on one of the geological formations. A work of that kind would follow out the beds throughout the country and would be exemplified by drawings of various physical features, fossils, and whatever else would enable the student to understand the present appearance and the history of the strata. Geologists in such cases try to make their survey exhaustive. It is a pity Mr. GOTCH did not introduce in his volume a map of England showing the position of the numerous buildings which he has described. It would then be manifest how large a part of England it was necessary to explore in order that the reader should be able to realise with certainty the character of the treatment which can be classified as Early Renaissance. With the exception of Bedfordshire, Cornwall, Cumberland, Monmouth and Durham, we have one or more examples from all the English counties. Northampton receives more notice than any of the others, but it is a county which contains admirable specimens of the style. Aid has been obtained from various sources for the illustrations, but the majority of them have been supplied by Mr. GOTCH who, when photographing, it is needless to say, always selected the points which display the most pleasing aspects of the buildings.

* *Early Renaissance Architecture in England*. A historical and descriptive account of the Tudor, Elizabethan and Jacobean periods, 1500-1625. For the use of students and others. By J. Alfred Gotch, F.S.A. (London: B. T. Batsford.)

Generally speaking the changes in the character of art in any country have been gradual, and, in consequence, it is not always easy to lay down lines of demarcation which will denote the various stages. But in England there seems to be definite means for determining the transformation from Gothic to Renaissance. WALPOLE, who paid more attention to the subject than the majority of inquirers, suggests that one factor was the rivalry between HENRY VIII. and FRANCIS I. The French king brought from Italy ANDREA DEL SARTO, PRIMATICCIO, CELLINI, LEONARDO DA VINCI and artists of less renown to adorn his palaces. HENRY tried to tempt RAPHAEL and TITIAN to visit England. He is said to have secured JEROME DI TREVISI, ANTONIO TOTO and BARTOLOMMEO PENNI, who was a brother of RAPHAEL's assistant. TORRIGIANO was by the king's wish commissioned to create the tomb of HENRY VII., and, according to CELLINI, he went to Florence in order to engage young artists. The sculptor offered to make CELLINI's fortune if he would accompany him to London. WOLSEY, it is said, employed BENEDETTO DA ROVEZZANO, a Florentine sculptor, to prepare a tomb for him, which was believed to be more beautiful than TORRIGIANO's, and apparently BACCIO BANDINELLI also prepared models for the same work.

With Italian artists engaged on important works there was a chance of Italian architecture gaining a footing in England. Grave and potent elders might imagine there was danger in the influence of foreigners, but, on reflection, English good sense must have convinced them there was not much to be feared from a few Italian artists. A corrective was also found in the employment of other foreigners. No Italian gained so much influence as HANS HOLBEIN, not only with the king but amongst the nobles. There were likewise Germans and Hollanders entrusted with artistic works about the Court. Mr. GOTCH is therefore justified in saying that "the character of Renaissance work in England during HENRY VIII.'s time inclined to Italian and the French version of Italian. After his death it inclined towards the Dutch version."

It could not be supposed that English gentlemen would at once set about the erection of new mansions in order to employ a few versatile Italians. In the sixteenth century buildings were the subject of much deliberation, for it was expected that a man's residence should serve for his posterity during many generations. Italian and foreign artists were therefore obliged to be contented with monumental work, and the Early Renaissance is described by Mr. GOTCH as starting with TORRIGIANO's altar tomb in Westminster Abbey. It was followed by various other tombs, and judging from the illustrations given in the chapter upon them, they showed signs of the style employed in subsequent operations on a larger scale. Evidently the foreign artists made concessions in order that their work might not seem too inapposite in Gothic buildings. That would be less difficult with Germans or Dutchmen who were familiar with modified Gothic. There was, however, generally a profusion of ornament. But in some cases the human figure was less gracefully modelled than it would be by TORRIGIANO, and grotesque figures are to be found which, if the work of Italians, reveal there was deterioration under English influences. On this subject we are told:—

With the close of the first half of the century we come to the end of pronounced Italian detail. The nature of the detail of the second half of the century is different; it no longer comprises the dainty cherubs, the elegant balusters, vases and candelabra, the buoyant dolphins and delicately-modelled foliage which are associated with Italian and French Renaissance work, but it indulges freely in strapwork, curled and interlaced, in fruit and foliage, in cartouches and in caryatides; half human beings have pedestals, such as were the delight of the Dutch of the time. But the extreme heaviness of the Dutch work was lightened in its passage across the waters, and the English workmen seem to have improved upon their later models as much as they fell short of their earlier. . . . In addition to the change in the character of the detail, we find a Classic rendering of strings and cornices more prevalent; doorways became frequently round-headed instead of flat-pointed, windows became square-headed, and all accessories parted with what remains of Gothic character they may have possessed in favour of a Classic treatment. But the general body of a building was less susceptible of change than were its particular features.

Mr. GOTCH next describes the development of the house-plan from about 1460 to 1635, or a period of nearly two centuries. As the numerous plans are drawn on the same scale, the comparison of them becomes easy. Between Great Chalfield, Wiltshire, which was built at the end of the reign of HENRY VI., and Aston Hall, erected between 1618 and 1635, there is a remarkable difference. In the first we have the hall approached through a passage called the screens, and also from the kitchen and servants' department. The hall was the most important part of the house, and the development consisted in a great measure in alteration of the relation between it and the other rooms. But when Aston Hall was erected the hall had ceased to be the general living room, and had become the principal entrance to the other apartments. In Burton Agnes, which was built in 1602-10, beside the hall we have spaces which are assigned on plan to drawing-rooms, dining-room, morning-room, schoolroom, servants' room, with rooms for the butler, housekeeper, servants' hall, &c. Each new mansion was, we suppose, considered to have advantages beyond those which had been built in preceding years. Utility or comfort has usually the upper hand in England, and it was through its influence so many new buildings were erected. The old mansion-houses were demolished, regardless of their associations, and it must have been a happy time for all who were connected with the building trade. From some lines by HERRICK and the satires of HALL we learn that the sacrifice of the interests of humbler people did not cause much compunction to the eager building owners. If a widow's house was likely to interfere with the prospect from one of the windows of the new mansion it was cleared away, because it was known that poor people dare not invoke the aid of the law against their superiors. What is remarkable, however, is the indifference of SHAKESPEARE and other writers of his time to the desire for new buildings which was then felt in so many parts of England. The raising of money and the making of arrangements with surveyors and the tradesmen who were to carry out their instructions must have occupied much of the attention of people in ELIZABETH'S time, but of all the anxieties which were caused by so many undertakings, we have no record in the numerous dramas which were then produced. As regards building, the mirror was not held up to nature, and there was no reflection of the form of a power that, although only secular, recalled the enthusiasm of the Mediæval church builders.

The indifference of the dramatists is the more surprising because there was an affinity between English Plays and the new form of building. The Miracle Plays and the Moral Plays were derived from the Church, and English mansions of the pre-Tudor age recalled many of the features of English churches. But in the time of HENRY VIII. there was a change, and UDALL'S "Ralph Roister Doister" was inspired by PLAUTUS and TERENCE just as the Renaissance style could be traced to Roman buildings. The scene of some of the early comedies was laid in Italy. So thorough an Englishman as Sir PHILIP SIDNEY complained of the disregard of the antique unities which was displayed by most of the dramatists, and we suppose there were travelled Englishmen who no less deplored the free interpretation of Classic forms which was to be seen in the works of the builders. The plays, according to SIDNEY, were neither right tragedies nor right comedies. It might be said that the Renaissance buildings were neither English nor Italian. BEN JONSON endeavoured to keep up to the high Roman fashion in his plays, and if the learned bricklayer were asked to design a building it would probably have been much more Classic than any that were in progress at the time. But he was not successful, and we doubt if in ELIZABETH'S reign any building having only Roman characteristics would have won approval.

In the plays, taken as a whole, variety is one of the most marked attributes. The numerous buildings which Mr. GOTCH represents demonstrate that variety should be also considered as belonging to them. In treatises and essays which deal with similar work only a comparatively few illustrations are introduced, and in order to uphold their connection with the Renaissance, examples are selected which are symmetrical. But when, as in Mr. GOTCH'S volume, an immense number of buildings are brought together, then it becomes manifest that they were often

treated without any sacrifice of convenience to regularity or symmetry. We see mansions which might be taken as suggesting that the designer was possessed of modern notions of what constitutes the picturesque, and made that quality supreme in his planning. Compton Winyates dates from 1520, and yet it would be difficult for a modern architect to contrive more numerous departures from monotony. The condemnation of Tudor work which has often appeared in print can be attributed to insufficient knowledge.

When we see so many excellent examples of building the question must arise, By whom were they designed? We must not judge of the arrangements of the sixteenth century by those which are now adopted. Designs were prepared by artists for houses, but much was left to the skill of those who were responsible for the different classes of work. WALPOLE tells us that he possessed a drawing by HOLBEIN for a magnificent chimney-piece, but he could not ascertain whether it was one mentioned by PEECHAM for HENRY'S new palace at Bridewell. HOLBEIN, if we may judge by his drawings, was fond of precision, and we may therefore assume that his design was at the disposal of anyone who would pay for it, since there was no title upon it. On this subject Mr. GOTCH says:—

The architect, as a distinct individual, does not seem to have arisen in those early days: the architect, that is, who not only designed the plan and elevations of the building, but also the details of its various parts and of its ornament. Inigo Jones may be taken as the first Englishman who combined the functions of planner and designer of details. Previous to his time the work entailed in the designing of a house was much subdivided, the plan and elevations being provided by the surveyor, and each trade producing its own special details as the work went on. Shakespeare only uses the word "architect" once, and then not in connection with building operations. He gives us, however, a sketch of how to set about building in the second part of "King Henry IV." "When we mean to build," says Lord Randolph, "we first survey the plot, then draw the model; and when we see the figure of the house, then must we rate the cost of the erection. . . . Much more in this great work . . . should we survey the plot of situation and the model; consent upon a sure foundation; question surveyors." It was the surveyors, such as John Thorpe, who drew the model, which comprised the plans and an elevation, or a perspective view indicating the treatment of more than one front. These drawings were then carried out by the workmen on the spot, who provided their own details. In some of the simpler buildings no surveyor is employed, but rough plans were prepared by the builder himself, not so much to work from, as to indicate for the purpose of a contract the general extent and appearance of the building. In others, again, no plans were used; but the work was set out on the spot, and built to the requisite height under the supervision of the master mason. It is almost certain that in some cases only a plan was provided, without elevation; in the Thorpe collection a large proportion of the plans have no elevation to correspond; and Henry VII. in his will orders his tomb to be placed in the midst of his new chapel at Westminster, according to "the plat [*i.e.* plan] made for the same chapel and signed with our hand." At St. John's College, Cambridge, the contractors who built the second court were bound to erect it according to certain "plats and uprights" [*i.e.* elevations], thus showing that the "plat" did not include elevations as well as plan.

There is a special chapter on sixteenth-century house-planning, as illustrated by JOHN THORPE'S drawings, which as evidence of practice at that time will always be invaluable. The drawings are also, as WALPOLE says, "memorials of many sumptuous buildings of which no other monument exists." There were, no doubt, other men who occupied similar positions, but their plans have not survived. Mr. GOTCH merits to have his name always associated with theirs, for his two works are the first to render justice to a period that should have renown for its architecture as well as for its literature. In the province he assigned to himself he has laboured earnestly and faithfully. The results are placed before students on most moderate terms. The publisher announces that a cheaper edition will not be published, but the wonder is that a book which represents so much toil and contains so many illustrations can be produced at the price for which it is offered.

Mr. E. Doran Webb is preparing the designs for the new church to be erected at Edgbaston, Birmingham, at a cost of 23,000*l.*, as a memorial to the late Cardinal Newman.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual dinner of the Royal Institute of British Architects was held on the 3rd inst. in the Windsor Hotel, Glasgow. Mr. Emerson, president, occupied the chair, and the company numbered about 170. The Chairman intimated that Lord Rosebery had intended to be present, but had been obliged to attend a meeting in London. The Chairman proposed the loyal toasts, which were pledged with enthusiasm. Mr. John Belcher proposed "The Houses of Parliament," observing that the Houses of Parliament might learn a lesson from Glasgow. The buildings at Glasgow International Exhibition had conducted very much to its financial success, and there were also the great Municipal Buildings. The great city, given over to work and commercial interests, had not yet forgotten art. Glasgow was clever enough to know that art paid as well as gave pleasure. Mr. Cross, who responded, said that they did not nowadays destroy their old monuments nor convert their Pantheons into hospitals. Nor did they make their castles quarries from which to build farmsteadings. They had changed all that, and the same spirit would enable them to rise to the occasion in the new buildings they had to erect. He understood that only one of the new public offices at Westminster was to be handed over to the Board of Works. The designs for the other were, he believed, to be entrusted to the son of Mr. Young. He was sure no arrangement could be made which was more likely to succeed. He did not think, at all events, that considerations of economy were likely to interfere with the realisation of the plans for these Westminster buildings. It should be their aim to see that these great buildings, which would be there practically for all time, were none other than the very best. After the toast of "The Corporation of Glasgow" had been proposed by Mr. John Slater, and responded to by Bailie Cleland,

Bailie Shearer gave "The Royal Institute of British Architects and Allied Societies." Having reviewed the history of the Institute from its inception, Bailie Shearer said that the architects of Glasgow had played a prominent part in the well-being of the city. In a city like Glasgow, mainly manufacturing and commercial, artistic sense and taste might not be met in all its fulness, but city of toilers as they were, they could point to beautiful spots in their midst, and to buildings worthy of a visit even from the Royal Institute of British Architects. While they had slums still to be uprooted, they had as much civic pride as to desire that their dwellings should be a lovely thing, and not a frightful thing on the face of the earth. Their architects had taught them that light, airy and sanitary dwellings for the poorest could be, and should always be associated with beauty of line and harmony of colour, with grace and dignity. That teaching they would strive to carry out.

The Chairman, in responding, said Scotland had always had a prominent place in regard to the arts and culture. Edinburgh, indeed, had been called the modern Athens. Scott had been largely responsible for the revival of Gothic architecture in the middle of last century, and in the annals of architecture there were the Scottish names of the Brothers Adam, Hamilton, Bryce, Young, Bryden and many others. If the experience of the Institute told them anything, it seemed to point to the fact that there would be undoubtedly great progress in the art of architecture during the coming century, judging from the works of their students, and in this Scotland was very much in the forefront, for a very large proportion of the medals they gave fell to Scottish students. The allied societies and Glasgow had done much for the art of architecture of late years. The art galleries and the municipal buildings showed a considerable advance and progress in the art. The Exhibition buildings, he certainly thought, were, with the exception of the Chicago buildings, the best of the class he had ever seen, and the Chicago Exhibition had unlimited money and the pick of the architects of Europe at its back. They saw discussions taking place on such subjects as the housing of the poor among county council men, members of Parliament, engineers and others. How often had any of these individuals really proper qualifications to lay down the law on such a subject? It should be the consensus of opinion of an Institute like theirs, with its allied societies, which should carry the greatest weight, and their views which should be heard most clearly upon such a question. They must, therefore, speak out, and with no thought of selfish ends. Their recommendations must be above suspicion.

Mr. J. J. Burnet, A.R.S.A., Glasgow, replied on behalf of the "Allied Societies." As a corporate body the Glasgow Institute, as well as individually, were endeavouring quietly to meet the various responsibilities of our time, and he ventured to believe that the presence with them that night of so many of Glasgow's eminent citizens, and the reception given to the toast on this the first visit of the Institute to Glasgow, might be looked upon as some proof that their city was steadily growing in its appreciation of architecture. They could not hope that in a large commercial and industrial centre like Glasgow the art of architecture would be generally understood and appreciated, but

they knew that amongst those responsible for its various municipal and private schemes there was a growing conviction that such schemes would remain monuments not only of our commercial and industrial enterprise, but would be looked upon as indicating their state of culture at the time, and the need they felt that their material surroundings should be in sympathy with their deeper needs and loftier aspirations, and they looked forward with confidence to the growth of this feeling, eager to render themselves more competent to give it expression.

The remaining toast was "The Guests," which was submitted by Mr. Campbell Douglas and acknowledged by Mr. John Wilson, M.P.

ROMAN REMAINS IN HAYLING ISLAND.

THE main Roman road from Porchester, at the head of Portsmouth harbour, to Chichester runs through Havant, in the east of Hampshire, and a mile or two south of Havant lies Hayling Island. It is now connected with the mainland by a bridge, but in early times it must have been quite cut off, except at very low tide. Formerly it was of much greater extent not only on the west and east, where Langstone and Chichester harbours respectively have been excavated by the action of the sea, but also to the south, where the Church Rocks bear witness to the truth of the tradition that the original South Church stood on a spot now covered by the waves. With Roman settlements in Hampshire, Sussex and the Isle of Wight, it is not strange that tradition should have come down to us of the existence of Roman remains in Hayling Island, and fixed the site at a spot which the excavations of Mr. Talfourd Ely have shown to be correct. In the north part of the island, a little to the west of North Hayling Church, is the Towncil Field, part of a larger area at one time held in allotments, and here from time to time coins have been turned up by the plough. In this field there was a slight elevation, manifestly artificial, and when examined carefully it was easy to trace, by the different colour of the crops, the outline of the foundations below, just as at Silchester, the *insulae*, or blocks, may be detected by the same criterion of a less fertile yield over the stonework. In 1897 Mr. Talfourd Ely commenced operations, which have been carried on year by year since that time. Though he has been rewarded by no very valuable "finds" in the way of curiosities or museum specimens, he has had the good fortune to establish the fact that there stood a very early Roman building of large size, the foundations of the outer walls being, in round figures, 150 feet by 170 feet. And the method in which the excavation has been carried out is probably unique, for all the work has been done by himself. He had not to plan the excavations, but to carry them out. The popular idea, as exemplified in a plan prepared from an inspection of the lighter lines in the crops, was that of a building with a semicircular apse at one end. This, however, the excavations have not quite confirmed.

As the work progressed it became evident that there was more than a villa in the sense of a country residence. The outer walls seem to have enclosed not only the house but out-buildings, such as sheds or barns. The living-rooms were indicated by the presence of painted wall plaster, roof tiles and light and dark tesserae, though nothing was found that could in any way compare with the fine pavements unearthed at Brading, Silchester and many other places. This is probably due to the early date of the work, which is approximately fixed at the end of the first century of our era. A bronze coin of Domitian, with the date A.D. 95, was found during the work. This is absolutely new, as if just minted, and must have been dropped here practically without having passed from hand to hand. Later coins have also been met with, but early coins seem proportionately commoner here than in most villas. Year by year the excavations have gone on and thrown more light on the character of the building, which will, no doubt, be described fully by Mr. Talfourd Ely when the work is finished. Last year a chamber was uncovered, the floor of which was of small flints, covered with trampled clay, set with tesserae so thickly that more than eighty were kicked out from the space of a square yard. The building must have been warmed by hypocausts, for remains of the furnace and flue-tiles were found. A very fine specimen of Romano-British work, in the shape of a circular bronze brooch, was discovered. The groundwork is blue enamel, still brilliant, with a central raised circle, surrounded by smaller ones, each with a depressed setting for a stone. This year a corridor, 30 feet long, another about 40 feet, and a room, 15 feet by 20 feet, were uncovered, so that it is safe to conclude that the house itself was of considerable size. A very interesting discovery consisted of a number of fragments of terra-cotta, with deep flutings. Mr. Ely believes that the pieces are to be accounted for by the building having been burned down. The terra-cotta probably served as a dado or wall lining, as many of the pieces have a projection at

the back, apparently for fastening to the wall. The other remains include nails, a Roman key, a razor blade or knife, black Romano-British pottery and a few pieces of red Samian ware. No human remains were met with; the bones belonged chiefly to domestic animals, and there was more than the usual quantity of boars' tusks, some of large size. Shells of the oyster, cockle and periwinkle were found, and it is noteworthy that the large edible snail introduced by the Romans was seen repeatedly during the progress of the work.

BROXBOURNE AND HODDESDON.*

IN old records the words Broxbourne and Hoddesdon are spelt in various ways. Domesday Book gives them as Brochesbourne and Hodesdon, or Odesdon. It is generally agreed that the first means Brock's bourne, the badger's brook, but the meaning of the latter is not clear. Mr. Whitley, who opened the tumulus we have seen at Broxbournebury, opines that it was the grave of Odo, a Danish chief, perhaps one of those who sailed up the Lea and remained in this neighbourhood for some time, until Alfred, after defeating the main body of the Danes in the West, turned his attention to these, and by cutting several channels in a shallow part of the river near Waltham, so that there was not sufficient depth of water to float the Danish ships, cut off their reinforcements from the sea. The Danes then fell easy victims to the Saxon soldiers. Probably from this Danish chief the place took its name of Odesdon or Odostown.

The parish of Broxbourne, with which is included the important hamlet of Hoddesdon, is about 16 miles from London and 4 miles south-east from Hertford. The Roman Way, known as the Ermine Street, passed in a northerly direction through the parish, and many interesting remains have frequently been found in the neighbourhood. In August 1874, as some labourers were making a new roadway from Burford Street to Ware Valley, just above the Woollen Brook, they came upon a trench about 8 feet long lying east and west, and at a depth of 2 feet from the surface. In this space they found a number of cinerary urns and a bronze spear-head about 2 feet in length, and in the immediate neighbourhood were found a quantity of animal bones and two Roman coins. Probably earlier than the Roman period, and certainly in later times, the way through Broxbourne has been an important thoroughfare, a fact of which footpads and highwaymen were well aware and frequently availed themselves. In 1693 Thos. Richards, Receiver-General, obtained a grant of 60*l.* from the Treasury for the expense to which he had been put in providing an escort of twenty armed men to convey the sum of 32,299*l.* 10*s.* from Hertford to London, which was brought there in safety. Three years later Francis Johnson, collector of excise, was not so fortunate, for in 1696 he was robbed of 776*l.* near Hoddesdon. The hundred of Broadwater in which the robbery was committed, was mulct in a fine of 520*l.*, the residue of the money being made good by the Lords of the Treasury, together with 169*l.* for legal costs and 15*l.* for a horse killed by the highwaymen.

But the road had its attractions as well as its terrors. Cussans, to whose "History of Hertfordshire" I am greatly indebted, tells us that at Hoddesdon, at the commencement of the eighteenth century, under the provisions of the will of Christian Catherow, brewer, a cask of ale stood always by the roadside for the refreshment of weary wayfarers.

It does not appear that this generous brewer was buried at Broxbourne, and it is feared that his beneficent legacy has been diverted from its original purpose.

From the description of Broxbourne given in the Domesday Book it must have been a pleasant, well-cultivated tract of country in those early days. There would be seen broad acres of waving corn, pleasant riverside pastures for cattle, and meadows yielding abundant crops of hay, and there were also woodland glades giving pannage for over 600 hogs yearly in this and the adjoining manor of Hoddesdon, or Odesdon. In the latter, too, there were four fisheries yielding nearly 300 eels a year. The two mills also find record.

At this time the manor belonged to Adeliza, wife of Hugh de Grentesmaisnil, a follower of William the Conqueror, who gave him large grants of land in return for his services. Petronilla, great granddaughter of Hugh, married Robert Beaumont, third Earl of Leicester, and in the reign of Richard I. they joined in bestowing the manor and church upon the Knights Hospitallers of St. John of Jerusalem, with whom it remained until the dissolution of religious houses, when it was granted by Henry VIII. to John Cock, of

Tewin, for the sum of 1,339*l.* 12*s.* 6*d.* He was succeeded by his son Henry, who was knighted in 1589. Sir Henry served the office of sheriff for this county in 1575, and was afterwards appointed cofferer to the queen, and on May 2, 1603, had the honour of entertaining King James I. at Broxbournebury in his royal progress to London.

The royal visit is thus described in Stow's Annals:—

"King James, in his journey from Scotland to London, came on Monday, May 2, I. Regni Sui to this Manor House in Brokesborne, where the Lord Keeper of the Great Seal, the Lord Treasurer, the Lord Admiral, with most of the Nobility of the Land and the Council, met him and received a favourable Reception; at which time the Lord Keeper made a short and learned speech to his Majesty, which the King answered with a great Grace and princely Wisdom; but the entertainment which this worthy Knight gave the King was so great and plentiful that every man, of what condition soever, had what appetite desired, and the King was highly pleased therewith, staid one night, and then forwards to Theobalds."

BROXBOURNE CHURCH.

The manor was held in succession by Sir Henry's wife, daughter and granddaughter, who married Sir John Monson, who had been a loyal supporter of Charles I. during the Civil War. He much improved the estate at Broxbournebury, and having received a license from Charles II. in 1671 to enclose about 320 acres in this parish, he laid out the present park. In this family the manor remained until 1789, when Lord Monson, the then proprietor, sold it, with the estate of Broxbournebury, to Jacob Bosanquet, director of the Honourable East India Company and trustee of Morden College, Blackbeath, from whom they have descended to Mr. Horace Smith-Bosanquet, in whom they are now vested.

Mrs. R. G. Hoare says "it seems probable that Broxbournebury is built upon the site of the priory of the Knights Hospitallers. It is about the centre of the property; a perfectly straight road used to lead from the house to the church, a priest's chamber still exists above the kitchen, and in the cellar there are the remains of a window of exactly the same architecture as the church."

The church, which is dedicated to St. Augustine, is a noble building standing on the verge of the western bank of the Lea Valley. It consists of a chancel (34 feet 4 inches), nave (72 feet), tower (20 feet 8 inches), 127 feet from west to east, continuous aisles extending to the east wall of the chancel, south porch and a small chapel on the north side of the chancel, now used as a vestry. The aisles are of the same width as the chancel and nave, viz. 41 feet 10 inches, all interior measurements.

The fabric is a fine building in the Perpendicular style of architecture, constructed of flint with stone dressings, and

* A paper read by Mr. Downes at Broxbourne on September 21 before the members of the Upper Norwood Athenæum.

probably erected by the Prior and Knights of St. John about the year 1420. In Mrs. Hoare's "History of the Church," it is pointed out that the nave, chancel and tower appear to be the work of the fifteenth century, but that the Say Chapel, built of blocks of Caen stone, bears the date 1522 on the parapet. The south porch may be of about the same date with the exception of the external facing, which is Classical and of a later date, and the chapel of the Cock family is evidently later and of inferior workmanship.

The west door, a fine specimen of old oak, is the main entrance to the church, and leads into the vestibule under the tower; the west screen is a modern erection. The tower contains five bells, which bear the inscriptions:—

I. Jesus be our spede—1615.

II. God save the King—1615.

(These bear founder's mark R.O.)

III. Cast by John Warner & Sons—1863.

IV. Praise the Lord—1615.

(Also bears founder's mark.)

V. John Hodson made me—1670.

(Edward Lewin gave toward my new macking 20 Pound.)

Thomas Welch, Robert Tarre,
Churchwardens.

The church contains several handsome monuments, including an altar tomb of marble with recumbent effigies of Sir

Broxbourne or Hodsdon, 1633." There is a list of vicars since 1361 in the tower porch. The present vicar is the Rev. John Salwey, M.A.

The first account of Rye House is to be found in Chauncey's "History of Herefordshire," where we read:—

"King Henry VI. granted license to Andrew Osgard and others that they might imparke the scite of the manor of Rye, otherwise called the Isle of Rye, in Stansted Abbot, erect a castle there, make battlements and loopholes, &c., have free warren there and on the hills of Stansted, Amwell, Hodsdon, Ware and Wiford, in this county."

There are few remains beyond the gatehouse of this castle now to be seen, but we may trace out the moat in places. It is doubtful whether the long dining-room is part of the old building. When our members visited it in 1883 Mr. Pope said, "A long barn has received a counterfeit open timber roof of old woodwork from a house in Hoddesdon, called now the Hall of the Conspirators, and hung with tapestry and many later devices and memorials of trade dinners and children's outings."

The house has no other historic interest than the one which gives its name to the abortive Rye House Plot. In 1683 the house was in the occupation of Richard Rumbold, an old officer of Cromwell, a maltster, a vehement Republican, and, according to the Royalist witness, the chief in the conspiracy. The purpose of the conspirators, according to the not very trust-

TOMB OF SIR HENRY COCK, IN BROXBOURNE CHURCH.

RYE HOUSE.

Henry Cock and Ursula, his wife. This is in the chapel of the Cock family, south of the chancel. In the centre of the chancel floor is the brass effigy of a priest holding a chalice, about 1470, and another brass of a priest in academic dress about 1510. On the south side of the chancel an altar tomb of marble, with brass effigies of a knight in plate armour and a lady, both with heraldic devices to Sir John Say, ob. 1478, and Dame Elizabeth Cheyne, his wife, ob. 1473, is remarkable for the coloured enamelling of the brass figures. Opposite, on the north side of the chancel, is the canopied altar tomb of Sir Wm Say, founder of the chapel, which originally bore the date 1529. There are, besides, three brass scrolls let into the floor of the north aisle and a brass to John Borrell, serjeant-at-arms to Henry VIII., ob. 1521, and Elizabeth, his wife, with thirteen children, and six English verses and a shield of arms (1630) on the floor in the centre of the nave. Various memorials remain to the families of Monson, Bosanquet, Skeffington, Rawdon and Hicks, and an interesting font of late Saxon or early Norman work.

The church was repaired and organ placed in 1837; cost £1,800. Roofs repaired in 1885. Communion plate consists of chalice, 1606; ditto, 1824; two massive flagons, 1669. Paten inscribed, "Gift of W. Raphe Palmer to ye parishe church of

worthy testimony of the approver Keeling, was to have some forty or fifty well-armed men concealed in the house and grounds to attack the guards who were to escort the king from Newmarket, and in the confusion Charles II. and his brother, the Duke of York, were to be assassinated.

The king's return to London at an earlier hour than was expected is said to have disconcerted the conspirators. Whatever was the cause, whether it was true that he had been warned of the attempt, the king escaped; but the discovery of the alleged plot led to the trial and execution of Lord Russell and Algernon Sidney, and years after of Rumbold and the Earl of Argyll, the exile of a great number of Whigs, and the temporary disruption of the party.

The whole truth concerning this plot is probably not known. Not only was the matter obscured by the false statements freely promulgated at a later period by the infamous Titus Oates, but the affection of King Charles for his illegitimate son, the Duke of Monmouth, who was also said to be deeply implicated, would furnish a strong reason for the non-publication of any evidence which might tell against that misguided young man.

The illustrations are from photographs kindly lent by Mr. H. G. Quartermain, M.S.A.

NOTES AND COMMENTS.

IN the churchyard of Johnstown, county Kildare, there is an ancient slab which has long been without any significance to visitors. It presented armorial bearings, but they did not relate to any of the families in the surrounding district. Some years ago the aid of Sir ARTHUR VICARS, the Ulster King of Arms, was invoked, but he was unable to identify them, although it was evident they expressed an alliance. Rubbings were taken for further investigation, and then it was discovered that the arms were those of FLATISBURY impaling WOGAN. There are no families of that name living in or near Johnstown. Further research revealed the fact that the family who resided there in early times was that of FLATISBURY, and a reference to the pedigree of the family ended in the discovery of a FLATISBURY, of Palmerstown and Johnstown, one of whom had married a WOGAN, of Rathcoffey, in the early years of the sixteenth century. That ancient family, of whom no survivor existed, was resident in that county in the thirteenth century, and they continued to flourish until the Civil War of 1641, when the members of the family were outlawed, and extinction followed. It is supposed that in Ireland family history is a familiar subject, but here we have an instance of an ancient family of which there are no representatives, and whose history has been revived by means of an heraldic representation. Heraldry is, therefore, not quite so useless as some people who are unacquainted with its principle would have us believe.

OWNERS of motor-cars should take notice of a decision that was given at the Hove Petty Sessions on Monday last. A gentleman was summoned for contravening the local by-laws by erecting a building which encroached on the air-space allocated to the house. When the attention of the motorist was called to the structure he said he would put it on wheels; the corrugated roof was also taken off and placed at the side. He described the structure as a portable under-carriage for the motor, but the Hove Corporation affirmed that it was a shelter for the motor-car, that it was constructed of combustible material, and that plans for it had not been deposited. Mr. LONG, an architect of Brighton, said it could not be treated as a building, for there was neither floor nor roof and it stood on wheels; in spite of the presence of the carriage, there was still a superfluity of air-space for the premises. The magistrates, however, held that it was a building and that it contravened the by-law. A fine of 20s. and costs was imposed.

THE important subject of water supplies and river pollution will be considered at a conference to be held by the Sanitary Institute at St. Andrew's Hall on next Wednesday and Thursday. The subjects to be treated on the first day will include:—"Watershed Areas, the physical conditions and standard of purity to be desired, and the prevention of contamination"; "The protection of underground sources of Public Water Supply"; "Rainfall and Population in relation to Water Supply"; "The desirability for reports on the Water Supply of each County"; "The Rivers of Glamorganshire, with remarks on the Rivers of adjacent Counties"; "Water Supply to isolated Cottages and small groups of Cottages"; "The present inadequate Water Supply for Villages and Village Schools." Sir A. B. BINNIE will preside. The subjects for discussion on the second day, when Mr. W. WHITAKER will be chairman, are "Water Supply and River Pollution"; "The control of Weirs and Dams on Rivers in relation to River Pollution"; "Prevention of Pollution within the Thames Watershed and Thames Water Supply and Storage"; "The Chemical Standard of Purity of Water Supplies"; "Sterilisation of Water"; "The Commercial and Industrial Value of Soft Water." There will be visits to the New River Company's testing shop, East London Waterworks at Lea Bridge and the Staines reservoirs. An exhibition of appliances, models, drawings, &c., will be opened each day at the hall.

It was known to archaeologists that many examples of pottery were found in the ancient Chersonesus, now called the Crimea, but for some reason it was assumed they were importations rather than products of a country which the Greeks regarded as barbaric. From the explorations under the direction of the Polish archaeologist, KOSEIUSZKO-

WALNFHINITSH, it has become evident that the theory is erroneous. Indeed, it might be said that instead of importing pottery, there were exports of all varieties of ceramics on large scale. The pits from which clay was taken were found near Sebastopol, as well as remains of the ancient ovens, besides moulds for figures and fragments of vessels of various kinds. Whether every piece bore the potter's mark is not stated, but on the handles it was necessary to have the official stamp of the *astunomoi* or public officer, who we suppose was responsible for the exact capacity of all vessels to hold liquids, as well as for the care of the streets and highways. The stamp would therefore correspond with those imprinted by the inspectors of modern county councils. There are twenty-eight examples which reveal that at one time the public officer was HISTROPOS, the son of APOLLONIDES. It is believed the same officer also looked after the local mint. Many fragments are of brown ware, which was supposed to be produced in a different part of Greece. One potter evidently used a rosette to mark his work. Besides fragments of pottery, the explorers have met with inscriptions on stone, terra-cotta statuettes, toys, ornaments and other things, which are evidence that the town had a large population.

CLERKS' GALLERY.

THERE is no branch of business in which competition is keener than in that of insurance. Although the days of symbolism are said to have passed away, yet it is now recognised that effective building can become more expressive of the condition of one of the companies than myriads of pamphlets. In England the fact was not always accepted, and wealthy insurance companies possessed offices which seemed to be incompatible with a large capital. In the great American cities, on the contrary, architecture is relied on as a means to suggest the standing of insurance companies, and when branches were set up in this country the same policy was adopted. The new offices of the Mutual Life Insurance Company of New York are among the most remarkable examples of enterprise to be found in the Metropolis. Realising that many people might imagine that business in England was to be secured mainly for the benefit of Americans, the directors, by obtaining a freehold in a street like Cornhill and erecting a palatial building upon it, have shown their determination to remain in London, and to enable investors to take advantage of a system which has been profitable on both sides of the Atlantic. The building which Mr. MACVICAR ANDERSON has designed, and Messrs. CUBITT & Co. have constructed, has undoubtedly been costly, but the outlay has been warranted by a success which has been continuous during sixty years. It was considered advisable that the old premises which stood upon the site should not be entirely demolished, and the adaptation added to the difficulties of the architect's task. The illustrations we give will enable our readers to realise the architectural character of the building. But in order to do justice to the treatment it would be necessary to have coloured plates, for, as is suggested, various marbles have been employed to gain effect. Greek, Norwegian and Italian quarries have been laid under contribution, in addition to granite and Portland stone. The result of the combination should be seen in order to be fully appreciated, and the work in marble is among the most successful of Messrs. FARMER & BRINDLEY'S undertakings. There is no doubt that a building which must engage the attention of all visitors to Cornhill, and which will form the subject of many conversations when they return home, is an excellent investment for its owners. The Mutual Life Insurance Company deserve an increase of business for their courage in obtaining as suitable a building as could be constructed. There is nothing fantastic about it, for it is a commercial palace worthy of London, and one which it would be well if many English companies would imitate. We gave some interesting particulars of the prosperity of this company in our last issue.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE first general meeting of the Liverpool Architectural Society (Incorporated) since the incorporation of the Society was held on Monday.

Professor Simpson, in his presidential address, congratulated the members upon the incorporation of the Society. They had not been hasty in taking this step, for they had already celebrated their jubilee. Under their new title he hoped the Society would enjoy many years of increased prosperity. The Professor then referred to the decision of the Liverpool Cathedral committee that the style of the new cathedral should be Gothic, and after tracing the history of the Gothic revival in England, he remarked that in the large workshops there was no longer the enthusiasm for Gothic work which prevailed twenty years ago, and which made the Gothic revival more real than many supposed. Of the men whose genius carried the revival to its height few survived, and to these might be added some of the younger men who had remained true to their masters' traditions, but without the slightest exaggeration it might be said that the greater number of architects now practising in England were seeking development in other directions than Gothic. What was Gothic? Unfortunately Mediæval detail was still regarded by some, especially by those interested in but not practising architecture, as constituting the Gothic style. But this was the wrong way of looking at it. Construction, not detail, made a style. If the committee were willing to depart from the recognised forms of ornamentation, which hitherto had been more or less obligatory, and allow the architect who designed and the other artists who assisted a free hand in plan, ordinance and detail, then it was possible that a building could be produced suitable to modern requirements, and yet Gothic in the true sense of the word. But if, on the other hand, by Gothic the conventional was meant; if the term was to be narrowed to mean a reminiscence of Mediæval buildings; if the plan, mouldings, carvings and accessories were such as would conform to the standard of the amateur, whether ecclesiastical or lay, who took no interest in living architecture, but who found satisfaction in examining the work of the past, then there was every danger that the finest opportunity which had occurred since the time of Sir Christopher Wren was going to be thrown away. If the term Gothic was used in its narrow sense limitations would be placed on architects which workers in no other art would tolerate for a minute. Why they should always be the sufferers he failed to understand. They were daily told that other arts were advancing while theirs was standing still. He did not believe that. The advance in architecture was as great, if not greater, than that in any other art, but restrictions such as that proposed would be inflicted rendered advance doubly difficult. If the Emperor Justinian had commanded the architect of the new Santa Sophia to construct it in the Greek or in the Norman style the world would have been the poorer by one of its finest buildings. But the emperor had too much good sense; he allowed the architect fair play and a free hand, and that was all they asked from the Liverpool Cathedral committee at the beginning of this new century. If there was ever to be a new departure now was surely the time. Architecture more than any other art in existence suffered from a glorious past. What should be a source of strength to them was converted into a source of weakness. Nobody admired the old Gothic buildings more than he did. There was not a cathedral in England which he had not visited, and he had seen most of the best on the Continent, but that did not make him regard their style as the one most suitable for a modern cathedral. His objection was not so much to the decision that the style was to be Gothic as to the dictation that the style was to be anything at all. The citizens of Liverpool elected otherwise seventy years ago. If Elmes had been told he had to design in the Gothic style they would not have had St. George's Hall one of the most remarkable buildings in the world. He would be told that that building was different; that it was not ecclesiastical. No more were the Houses of Parliament, built at exactly the same time; and yet that did not prevent the committee from issuing instructions to architects that the style of the building was to be Elizabethan or Gothic. Had they advanced nothing in seventy years? Was the method observed in London in the first year of Victoria's reign to form a precedent to be followed in Liverpool in the first year of Edward VII? There was some excuse seventy years ago. The tide of the Gothic revival was flowing strongly, and men were full of enthusiasm for the new movement, but the tide had turned now, the old enthusiasm was dead and a new movement on totally different lines had taken its place. It was unfair to ignore this fact. Cathedrals were not built every day. Another such opportunity might not occur throughout the century, and the narrowing of the instructions to architects could cut out many men accustomed to deal with big architectural problems, but whose sympathy with Gothic was but slight, because to them the style was inappropriate to the requirements of the day, and incapable of further development

beyond the point reached 300 years ago. To turn to another point. Against the style dictated there were certain local objections. Liverpool had fine architectural traditions, but they were not Gothic. Its public buildings and many of the fine blocks of city offices erected before the middle of the last century were all Classic. So were the best recent buildings in the town. A Byzantine or Romanesque cathedral would harmonise with these surroundings, because both styles were founded on Classic work. The site undoubtedly lent itself more to the squarer Classic or Byzantine than to the longer, thinner Gothic. He was not, however, protesting so much against the inclusion of the Gothic, although he regarded it as unsuitable, as the exclusion of the other styles. That the style should be left open was one of the points the Architectural Society emphasised in the meeting held between the cathedral committee and a deputation from the Council of the Society. They intimated to the committee their disapproval of a limited competition, on the ground that outside the very few really well-known church architects, it could not be said that there were many who possessed special claims to be regarded as experts in cathedral planning and design. Many men had recently built excellent churches, but a man who built a decent church might not be capable of dealing with the much bigger problem of a cathedral. Provided the committee did not wish to appoint direct one of the well-known men as architect, the Society suggested a competition open to all English architects, and that proper assessors should be appointed. They further suggested that at least six months be allowed for the preliminary competition, and twelve months for the final. None of these suggestions had found favour; in fact, he understood the committee had decided to dispense with assessors altogether, and make their own selections from portfolios and drawings submitted. If this were true it was opposed to the method under which all important competitions were now decided. Practical considerations were ignored by the restriction as to the style of the cathedral, and the only result would be to fetter the architect and all whom he called to assist him. This was to be the first cathedral of the new century. Was it to be merely the coping-stone of the style of the last century, or was it to be the foundation of the style of the new? Here was a chance for an epoch-making building, for a second Santa Sophia, a second Amiens Cathedral. Was this chance going to be thrown away? The committee, he was sure, were animated by the same desire as all of them to see a building worthy of the city and worthy of the opportunity. But with all deference they were going the wrong way to obtain it. It was no offence to them to say that, not being architects, they were out of touch with the architectural movement of the day. They were clinging to a departing style. In an unrestricted competition it was possible that the best style sent in might be Gothic; if so, build it; but the decision of the committee prevented any attempt being made to show what was possible on other lines. The cathedral might take a quarter of a century to build, and at the end of that time if dry as dust design was now chosen, and the present architectural movement continued to grow as rapidly as it had done in the last ten or twelve years, it was probable that the first cathedral of the twentieth century, when finished, would be as obsolete in style as an old East Indiaman was now.

Mr. Bradbury (surveyor to the cathedral committee) explained the conditions with regard to the competition which had been confirmed at a meeting of the cathedral committee that day, and which will be found in our advertising columns. He pointed out that it had not been definitely decided to dispense with assessors, the committee having reserved to themselves the right of calling in professional assistance if they deemed it necessary. In his opinion the committee had tried to meet the views of the Architectural Society. At any rate he could testify that the points they had suggested were very carefully considered, and the first two conditions of the competition were drafted with the object of meeting them.

Mr. W. E. Willink failed to see any resemblance between the competition proposed and the one suggested by the representatives of the Society when they met the committee. It would have been very much better if the Society had never been invited to give their opinion at all, for it had been ignored, but the committee were under the delusion that they were meeting their views. A very large number of architects of repute, probably four-fifths, would be excluded from competing, because if they did compete they would be working on a style with which they were not well acquainted. The non-appointment of a professional assessor would ruin the competition, and the committee would find they had acted foolishly. Members of the Royal Institute of British Architects were prohibited from submitting plans unless a professional assessor was engaged. That the committee excluded everything except what they crudely called Gothic was a calamity. In proposing a vote of thanks to Professor Simpson for his presidential address, Mr. Willink remarked that it had been delivered on a melancholy occasion, for a great opportunity had been lost. How it came about that it was impossible for them to obtain a

hearing in a matter which so vitally touched their profession passed his comprehension.

Mr. Bradbury seconded the resolution. He did not intend to enter into any defence of the word Gothic as applied to the style of the cathedral, inasmuch as his opinion had not been asked.

Other members briefly supported the resolution, one gentleman remarking that it ought to be publicly known the architects of Liverpool were practically unanimous in condemning the action of the cathedral committee.

Professor Simpson, in responding, alluded to the newly-adopted instructions to architects, and asserted that far from meeting the views of the Society, the committee had done the very opposite of what they were asked to do.

THE ENCLOSURE OF STONEHENGE.

A CORRESPONDENT of the *Times* writes:—Stonehenge has now been enclosed by a barbed-wire fence four months or more, and some 3,000 persons have paid a shilling for admission to the enclosure. The line of the enclosure has no relation to the form of the monument, and a considerable area of ground is enclosed. Several carriage-ways leading from the neighbouring high roads to the monument—so strictly defined that they pass through clearly-cut gaps in the outer earthwork of the monument—have been obstructed by the fence—an act of doubtful legality. But one carriage-road has been admitted to be a public way, and has been respected. It leads across the downs from the direction of Wilton into and across the neighbouring high road, and is largely used. From it, at some little distance, the most striking general view of Stonehenge is obtained; the weird circles of stones are seen standing alone on the bare down, and give a curious impression of solitude and aloofness. This carriage-way cuts through the earthwork in two places and approaches close to the stones themselves. It is understood that proceedings for the diversion of this road by legal process are in contemplation. If these should be successful, the people of this country will be completely deprived of all right of access to a monument of absolutely unique interest and singular impressiveness—a monument to which they have freely resorted from time immemorial.

There are two points of view from which the enclosure of Stonehenge may be regarded. It may be considered in relation to the mere physical protection of the monument, or to its preservation for the benefit of the nation. The learned societies who counselled the enclosure had in view the first consideration only. They were alarmed by the fall of another trilithon on the last night of the old century—though, by the way, no barbed wire fence would have prevented this catastrophe. They thought they saw prejudicial effects in the unrestrained license given to the public to ramble and picnic amongst the stones without supervision of any kind. And they feared that the advent of the neighbouring camp would bring Tommy Atkins in his hundreds to quench his thirst for antiquarian lore and to wear away the stones by his untiring researches. It may perhaps be doubted whether the gradual downfall of the stones has been sensibly affected by the resort of the public to Stonehenge, or even by the roughest treatment it may ever have received. The external earthwork, no doubt, has been worn down and, as we have said, cut through in several places; but the gradual fall of the stones is probably due to time and weather alone. However, it may be admitted that some caretaking is desirable. It is quite another question whether (apart from pecuniary considerations) any enclosure at all is required. The British public is not now an unreasoning or mischievous body; and appropriate notices enforced by personal supervision would be quite as likely as fencing to secure reverential treatment for that which in itself inspires respect. And when we consider the question from the point of view of the preservation of the monument not merely as a collection of stones, but as a chapter in the history of these isles to be studied by the whole nation, the enclosure becomes not only unnecessary but highly mischievous.

For what is the position? The ground on which Stonehenge stands is admitted to be in private ownership, and according to the doctrines of English law, the priceless national relic which the soil bears also consequently belongs to a private owner. This owner, if he were so inclined, could cast down and cart away or break up every stone, and reduce the site to the condition of the adjoining down. Mr. Earle Drax, it must be remembered, did actually destroy Cæsar's camp at Wimbledon by way of asserting his ownership. But while there are few landowners who would be guilty of such an act of vandalism (the present owner of Stonehenge is, we believe, warmly interested in the precious possession to which he has succeeded), there are many to whom the joys of ownership are sweet, and who would not be indisposed to exclude the public from free access to an ancient monument on their land. Consequently the preservation of all rights of access enjoyed by

the public is most important to the nation. Now before the recent enclosure there is abundant evidence of access by the public, not only on foot, but in carriages, up to the very circles of Stonehenge. As we have said, so old are the roads and so well defined that the outer earthwork has been cut through to a depth of several feet in many places. It seems to have been assumed that a way which apparently terminated at Stonehenge could not be maintained as a public way. Some argument might perhaps be raised on the question, but a right of way to a church is well recognised, and, if it is a mistake not, a right of way to a point of view—the top of a hill—has been successfully asserted. There seems to be no reason why a right of way to an ancient place of worship or sepulture, to a place which was once a great tribal gathering-ground, should not be good in law. At any rate, the public had absolutely free access to Stonehenge, and in the absence of enclosure they could not have been denied such access. Thus, while the property was in private hands, the public had all they wanted—the means of viewing this strange legacy of distant ages. An enclosure completely alters the position. In the first place it destroys, or will, if left long unchallenged, destroy, all rights of way converging on the monument; and in the second place it actually excludes the public, and gives the owner not merely a property in Stonehenge (which he had before) but the exclusive enjoyment of the monument. It is true, of course, that the enclosure has been accompanied by arrangements for the admission of the public on a fixed payment. But it is not pretended that this admission is accorded to the public as a right, it is due to an act of grace on the part of the owner, who can at any time raise the price charged or close the gates entirely. And, further, every person who pays his shilling to see Stonehenge is negating the right of the public to see it without payment and confirming the owner in his right of exclusive enjoyment. It is extraordinary that the learned bodies who have, by their advice, made themselves responsible for this enclosure did not see that they were taking the most effective step which could be devised to deprive the nation of its enjoyment of Stonehenge.

It will be said that the tolls levied for admission are being expended on works of restoration, and that the owner could not be expected to execute such works at his own cost. This is rather a pitiful plea. If Stonehenge needs works of maintenance, the nation is surely rich enough to carry them out. Stonehenge is, perhaps, the most important megalithic monument, not only in the United Kingdom, but in the whole of Europe. Will the nation lose its enjoyment of such a unique possession for the sake of a few hundreds, or even thousands of pounds? But the fact is, the whole situation is anomalous. That Stonehenge should be at the mercy of a private owner as ridiculous as if Westminster Abbey were in that position. It must originally have been a public possession. By what means it became private property we do not know, but doubtless in the first instance by some royal grant of lands in dower, when there was little interest in the early history of the isles, and no thought was paid to the stone vestiges of that history. The nation should now recover its interest on proper terms, and this should be a preliminary step to any measures for regulating access to the monument. There are many ways in which the transfer can be effected. The owner can follow the excellent example of the Dean and Chapter of Salisbury Cathedral, who have placed the neighbouring most interesting remains of Old Sarum under the guardianship of His Majesty's Office of Works under the provisions of the Ancient Monuments Acts. A purchase outright may be arranged under those Acts, either by the Office of Works or by the Wiltshire County Council. Failing any arrangement by agreement, Stonehenge is so unique a monument and so absolutely national in its character that a measure of compulsory purchase would be justified. It is said that the owner has short since offered to sell to the Government, but at a price and on conditions which were prohibitive.

When once the nation is secured in the enjoyment of Stonehenge the conditions of the problem are radically altered. Any measures desirable for the protection of the monument then become a mere question of police; they cannot be wrested from the injury of the public. It might even be desirable to divert the admitted carriage-way, which, as we have said, cuts the outer earth bank in two places, and to take such measures as are desirable to emphasise the form and outlines of the monument in their entirety, though it is doubtful whether any fence is necessary for this purpose. But until the national enjoyment of Stonehenge is secured it would be suicidal on the part of the public to relinquish its admitted right to approach within the earthwork, and close to the stones of Stonehenge, by means of the existing carriage-way. This way is, at the present moment, largely used by those who do not care to pay a shilling to enter the enclosure, and from it a near view of Stonehenge can be obtained. It is to be hoped that the local authorities, the Parish Council of Amesbury and the District Council, without whose consent no diversion can be sanctioned, will stoutly oppose any application with that object, and it is even with

the consideration of these bodies whether some step should not be taken to obtain recognition of the public right over the ways already obstructed.

ARCHITECTURAL DESIGNS.

THE principles of design are as important as the mechanical art of drawing to an architect. He makes but a poor draughtsman who does not know the meaning of the marks he puts upon the paper. It is in this case as in poetry—he is the best artist who can express the most meaning in the fewest lines. A great critic has said that “he who talks of the rules of his art is only second-rate, and if he talks much he is no artist at all;” but since he wrote upon nothing else himself, and promised more, there is some reason to conclude that it was a fascinating subject. There is some universal principle which will please all people in all ages, but the appreciation it will receive depends upon the degree with which the pure feelings for beauty are unpolluted by the dross of fashion and perverted taste. To give names to the several qualities that can be expressed in architecture has long been a fertile source of interest, but it seems as though the numerous terms in use, instead of being conventional signs for things universally agreed upon, are rather like the monuments on a battlefield, to point out the places where there has been the most fighting.

The subject of architectural drawing divides itself into two classes—designs made for beauty and working drawings for constructive plans. Convenience of arrangement in the latter is not a general principle like the laws of form and colour in the former. The laws of form are less definite than those of colour; and with all their clearness, their mathematical analogy to music, and the universal dogma of prismatic equilibrium, we find in practice that though a pleasing effect cannot be produced by an exact balance of colour, there must be some prevailing tint to give a character to the work. The authorities for the use of colour in Classic architecture differ as to the manner of its application. Those who formerly considered it perfect by form alone were disappointed to find colour at all. The refinements of the minute Grecian curves are practically useless. Masons of the present day make long walls a little hollow to prevent them looking round, but it is not a subject for intense study in either case. Colour should never be used to complete form, but as an additional beauty after the form is perfect. The triangle is better than the square, and two ogees or a flamiform figure better than either. In streets and close squares the outline can only be a continental sky-line, broken by dormers and pinnacles, and if a building is detached, proximity to another of different outline will produce perhaps a disagreeable form of void between the two. This may be illustrated by balusters, which should be designed with great regard to the form of the light between them, which is the chief attraction for the eye. Exact imitations of nature are impracticable in the ordinary work of an architect's office. Warm buildings and blue skies are only effective because they are contrasts and complementary, and appear bright on the same principle as that by which Turner's pictures throw out their sunlight. The number of colours available in brickwork are small, but blue bricks should never be used, because the sky and distance are generally cold enough to balance the composition. Tiles are only addenda, whilst bricks may be worked into the construction. Coloured tiles were used in France in 1530 upon the Emperor Francis's palace of Madrid. The facings of street architecture might be cheaply decorated by moulded and coloured bricks. Shop fronts should be designed to attract attention by their individuality, but this is lost by one front merging into the next. One or two in a town are unusually prominent by returning to a fairly proportioned window on each side of a moderate door. Construction is sometimes forgotten in drawing for appearances.

In referring to the legends of natural types for the orders and styles, it is suggested that the Corinthian capital originated in some such custom as our own of tying evergreens round the columns at games and festivals; the upright leaves, the bead and cauliculi seem to point to this. The Grecians and Egyptians wished their art upon their temples, whilst our chief excellence is in the perfection of dwellings. To obtain light and fresh air are great points. A canon has been laid down by which 20 feet of cubic contents in a room should have 1 square foot of lighting aperture, but the same size of a window will light the room better from the end than the side. Bas-relief or sculpture should not be placed opposite the light, but this is the best place for pictures or hangings. The plasterwork of an apartment should be designed with great regard to the position of the light, and the plaster casts exhibited in different positions are illustrations of this. A cornice is particularly referred to, as designed to derive its beauty from light cast upwards. The lower moulding casts a shadow against which the light pattern upon its edge is shown to advantage. The cornice copied from the Classic exteriors should be lighted from above, which is not the case in a room. Ceilings should

have little ornament, but if any it should be small and plain. Animated figures and other suggestions of life should not be used in such unnatural positions, especially if above the natural size, as the eye always uses the human form as a standard for the magnitude of a room. A number of methods are mentioned of increasing the apparent dimensions and adding to the beauty of apartments; and it is suggested that architects should have more control over the finishing of a house. Although little is said of the mechanical practice of drawing it is of importance that the architect be master of his pencil, for directions to his draughtsmen will never convey the feeling to a curve that there is in one sketched at a sweep by his own hand, like the track of a swan in the water. It is probable that the more complex forms of beauty may derive their qualities from some invisible curve that floats about their point. Objects that appear out of place always do so because they attract the eye out of a smooth, graceful track; for, like lightning, the eye of taste will take the most direct line of conductors, and a rupture takes place at every undue interruption. The powers of projections and light parts for attracting the eye and the influence of colour or tones to increase or modify that power are the two grand points for study.

THE LAND TRANSFER ACT.

AT the annual meeting of the Law Society on Tuesday, Mr. J. S. Rubinstein, London, contributed a paper which he entitled, “A Legislative Blight,” being an attack on the Land Transfer Act. His argument was that the representations made that the effect of the Act would be to simplify and cheapen the transfer of land were delusive and fallacious. On the contrary, he contended, a purchaser now found a purchase took longer to complete, and the charges were considerably in excess of what they were previously. He recently completed for a client a purchase of a property he had bought for 1,250*l*. The client was well acquainted with the old system, but expected wonders from the new. When the day of reckoning arrived the client experienced a succession of shocks. The first was in finding that as a result of the new system he had to pay 5*l*. 12*s*. (being the additional charges consequent on registration), or over 20 per cent., additional costs. The second was in ascertaining that if he ever sold the property the certificate of possessory title he acquired would not help him or help his purchaser in the slightest degree. The third shock was due to the fact that, anticipating that his whole title would appear on the certificate, and that this would be the only document to take away, he found he had to take the deeds plus a certificate which was little else than an index to his own purchase deed. It certainly struck him that his deeds proved he was entitled to the property, and his certificate proved the same fact, and he asked what there was to prevent a person mortgaging the deeds in one quarter and mortgaging the certificate in another, and so raising money twice over on the same property. That the new system seemed designed to facilitate such transactions did not improve his client's opinion of compulsory registration. Since compulsory registration had been in force, and the expense of registration had to be added to the other costs, this fact had turned the scale in many instances, and induced a wavering client not to purchase. The tendency of the Act thus to resist transactions was seriously growing. He gave particulars of some cases that had come under his notice, illustrating the delays, difficulties and troubles the Registry put in the way of everyday business. The ground was certainly being sown with that “crop of nice questions” which they knew, on the authority of the Registrar-General, would fructify in due course. On the other hand, he admitted that Mr. Arthur Underhill's view that “but few proprietors will elect to register with anything but a possessory title” was borne out by the official returns. The salaries and expenses incident to registration for the three years 1898, 1899 and 1900 amounted to 54,600*l*., and the fees to 57,450*l*. As every county in England had the same right as London to have a registry office erected out of the public funds, the invention bade fair to involve the public and landowners in continuous outlay. He deplored the apathetic attitude of the public towards the new system. The City Corporation sent a deputation to the Lord Chancellor to urge that the new system should not be extended to the City until after an inquiry had taken place. The statement subsequently made in the House that the Government had no intention to hold an inquiry was, however, accepted without a voice being raised in protest. The Press rarely referred to the subject except to mention that so many thousand titles had been registered, which it treated as proof of the success of the new system, quite oblivious of the fact that this number had only been registered because registration was compulsory, and that the landowners who had been thus forced to register were groaning under its weight. The *Times* was justly looked upon as an organ of enlightened

public opinion. It was instructive to compare its attitude in 1897, before it was clear that the Act would be adopted in London, with the attitude it had since taken up. In 1897 all that the *Times* pleaded for was "two or three years of actual trial," and in 1900, when everyone who had been forced to go to the Registry joined in a chorus of condemnation, the *Times* designated a claim that the authorities should carry out their pledges and hold an inquiry as "querulous," and required them to "accept the inevitable" on the ground that the Act "had come to stay." At the risk of having some word used even stronger than "querulous" he emphatically reasserted that the Government was bound to carry out its deliberate pledges to grant an inquiry. Archimedes asserted that he could with a lever move the world if he could find a fulcrum large enough. Whatever its size, it would be insignificant in comparison to the one that would have to be found to move the official octopus when once it had fastened one of its suckers on to the public purse. With London within its grip, and with an Act which, now that the period of three years had expired, could at once be extended to every county in England, what hope was there that anything they could say or do would stay the blight that had settled upon London from spreading over the whole country? Black and drear as the outlook was, they must not retire from the field. They had, it was true, so far been defeated, and doubtless they could retire with a clear conscience and accept the gold mine that the new Act must prove to the profession as the consolation prize for their defeat. Their duty, however, to the public, to their clients, and to themselves imperatively called upon them to continue the fight to the bitter end in the hope that the public might even now open its eye before the descending knife completed its work.

Mr. Beale moved, and Mr. Kent (London) seconded, a resolution declaring that in the opinion of this meeting there had been sufficient experience of the working of the Land Transfer Act to justify a demand for full inquiry into the operation and effect of the compulsory registration of land.

Mr. McLennan (Rochester), Mr. Humfrys (Hereford) and Mr. Walters (London) spoke in support of the resolution, which was unanimously adopted.

THE STYLE OF THE LIVERPOOL CATHEDRAL.

A MEETING of the executive committee of the projected Liverpool Cathedral was held on Monday. The chair was taken by Sir William B. Forwood.

Mr. Robert Gladstone, in moving the confirmation of the minutes of the proceedings of the building sub-committee, said he desired to make some reply to the remarks which had been made with reference to the rapidity with which they had come to a very important decision—and that was the style of architecture to be adopted. He might say that when that decision was arrived at they had a very full committee, including the Lord Bishop and Lord Derby, very important members of the committee, and the subject was very fully and seriously considered; and as they had just heard the decision was unanimously in favour of the Gothic. There was no question raised as to the possibility of any other style being adopted. He thought they had come to a very sound decision, because however appropriate other kinds of architecture might be for public buildings such as town halls, or places like the Philharmonic Hall, theatres, &c., there could be no question whatever in the minds of thinking people that Gothic architecture produced a more devotional effect upon the mind than any other which human skill had yet invented. He had sometimes been asked why we had not got a twentieth century style, or at least why they should not strive for one; and why our architects could not invent something more in accord with present views of public worship and present ideas of religious architecture; and he could only reply that there appeared to be no such thing in existence, for, with the exception perhaps of the Crystal Palace, an erection of glass and iron, every public building without exception in this country was a reproduction in some form or other of former styles. He had taken the trouble to write down what Sir Gilbert Scott had said with reference to the most beautiful interior of Gothic architecture in this country—that of Westminster Abbey—when addressing the Institute of British Architects. Sir Gilbert said of Westminster Abbey that it was "a building which does not owe its claims upon our study to its antiquarian and historical associations, intensely interesting though these must be to every man worthy of the name of an Englishman. It has claims upon us architects, I will not say of a higher but of another character, on the ground of its intrinsic and superlative merits as a work of art of the highest and noblest order, for there are few churches in this or any other country having the same exquisite charms of proportion and artistic beauty which this church possesses; a beauty which never tires,

and which impresses itself afresh upon the eye and the mind, however frequently you view it, and however glorious the edifices which, during the intervals, you may have seen. He thought that all who had seen it must agree with what Sir Gilbert Scott had said. The great period of Gothic architecture was the hundred years which elapsed between 1220 and 1320, when the Early English entered upon the Decorative period. After that Gothic architecture became too much taken up with detail. In Westminster Abbey and other great churches built in that period, they found a majestic simplicity in the architecture which conduced, as he thought, most highly to devotional feelings, and to the proper conduct of public worship. Therefore he hoped the committee would adhere to their decision. On the subject of the selection of an architect there had been an unintentional mistake made in the news papers, which rather led people to believe that it was to be limited competition. The building committee recommended that it should be an unlimited competition. It stood to reason that there were many competent architects in this country who had had little or no opportunity of doing ecclesiastical work at all—still less on the scale of a cathedral—and they thought it desirable to let those who had not yet built churches, or even designed them, have an opportunity of showing what they could do. An advertisement had been drawn up, and would be inserted, inviting architects to send in portfolios of drawings, from which a selection would be made in due course, and their authors invited to enter a final competition.

The advertisement was then discussed, and it was finally decided that the committee should ask for an unlimited competition in the first instance, drawings of work already done or designs, to be sent in before January 1, 1902, the committee reserving to themselves discretion as to employing a professional assessor in making the selection of candidates for the final competition, and also the right to invite architects who should not take part in the first competition to send in designs for the final one.

The minutes were unanimously confirmed.

THE DESIGN OF FACTORY CHIMNEYS.

FROM an engineering standpoint a chimney is a vertical flue for removing the products of combustion, for inducing combustion, or for the removal of deleterious gases. The flow of the heated air and gases is due to their rarefied condition as they pass through the flue, thus constituting a column of air of less specific gravity than that of the ambient atmosphere.

Only brick chimneys are considered in this paper, and they should be constructed to fulfil the following essential conditions:—

1. The flue must be of proper height and sectional area necessary for a given velocity and volume of air for efficient combustion of the fuel burned in the furnaces.
2. Proportion and form of flue should be such as will offer the least amount of resistance to the flow of the gases.
3. Maintenance of the temperature of rarefaction by non-conduction through the walls or sides of the flue.
4. Provision for the expansion and contraction of the material composing the chimney.
5. Stability of the structure or power to safely withstand the external forces, being the combined force of wind and weight of structure.

Form and Dimensions of Flue.—The cross-sectional form of the flue is usually circular, octagonal or square, the relative efficiency being 100, 97 and 93, in the order named; the area should maintain throughout the height of the flue without reductions or enlargements. The dimensions are dependent on the kind and amount of fuel burned, the form and length of the ducts leading to the base of the chimney from steam boiler or other furnaces, and in some cases it becomes necessary to adjust the height to suit local conditions, such as adjacent high ground or buildings, or for the purpose of emitting deleterious gases at higher altitudes.

An engineer designing a chimney must and does have all knowledge of one essential; this is the power to be developed, and, consequently, the amount of fuel to be burned. With these data and statistics regarding the behaviour of chimneys in actual operation he is enabled to construct simple and reliable empirical formulas for his guidance. In the preparation or use of such formulas care must be observed to make due allowance for any conditions of moment varying from those upon which the formulas are based. It has been found that the far greater number of chimneys are subject to average conditions, and hence favourable to the use of empirical formulas. Some of the exceptions to these average conditions are when

* A paper read before the Engineers' Club of Philadelphia by Francis Schumann, and published in the *Engineering Record*.

urnaces are distant from the base of the chimney, when they are elevated and ducts lead downward to the base, when the ducts are restricted in area, or pass through damp or wet media, or when the chimney is surrounded by high buildings or near cliffs.

The following formulas are presented by Mr. Schumann as new and giving values agreeing very closely with those confirmed by actual and satisfactory results. The only claim made in their favour over other existing similar formulas is their greater simplicity.

K = total amount of coal burned per hour in pounds.
H = height of chimney in feet.
A = sectional area of flue in square feet.

The proper sectional area for a given amount of coal burned per hour should be:—

$$A = 650 K \div (36000) \times (650 K \div 36000)^{1/4}$$

in which 650 is the smoke produced in cubic feet per hour per pound of coal, and 36000 a velocity in feet per hour, or 10 feet per second, the velocity increasing with the amount of fuel burned per hour.

The area thus found may be altered to suit different heights of chimneys, but should not exceed 10 per cent. either way when used in the following formula for obtaining the height:—

$$H = 250 K \div (500 A - K).$$

The proportions resulting from these formulas apply to circular flues, and are ample for any kind of coal, whether anthracite, coarse, or fine or bituminous.

When the flue is octagonal or square the height, H, found above for given values of A and K, is to be increased (100÷97) and (10÷9) respectively.

The best economy in the furnaces is attained when the temperature of the gases at the base of the flue is between 550 and 600 deg. Fahr.

The amount of coal consumed per horse-power per hour is between 2.5 and 5 lbs., and burned at the rate of from 10 to 15 lbs. per square foot of grate surface.

Stability.—The stability of a brick chimney depends upon the strength of the material of which it is constructed to safely resist the stresses from the external forces, being the lateral force of wind and the superimposed mass, acting as a resultant at any horizontal plane throughout the height, or at the base of the structure.

The proportions must be such that the axis of rotation, or neutral axis of the resultant force, never falls within the respective cross-section, thus insuring compressive stresses of uniformly varying intensity only, tensile stresses not being permissible in masonry structures.

The non-conducting inner lining of the flue being separate from the outer shell, does not add its mass toward the stability of the chimney, but only to that of the foundation upon which it rests.

Procedure in Design.—After having decided upon the dimensions of the flue, find the outside dimensions at the top by adding to the flue diameter the thickness of the lining, the space between lining and shell, and the thickness of the outer shell at the top; the lining thickness need not exceed one-half inch, or 4 inches; the space, say 1 inch, and the shell, one inch, or 8 1/4 inches.

From these outer dimensions lay out the side lines of the shell with a batter of say 3/8 inch per foot down to the base of the chimney; subdivide the height into zones corresponding with the various thicknesses of the shell, resulting from the addition of brick dimensions, being respectively 4, 8 1/4, 12 1/4, 15, and 25 inches, and so on, each zone being of equal thickness throughout its height.

Determine the stability of each joint, commencing at the top; if deficient add to the mass by increasing the thickness of the walls, or by increasing the outside diameter.

The maximum force of the wind which the structure should withstand with safety is:—For square chimneys, 50 pounds per square foot of elevation; for octagonal and round chimneys, 35 pounds per square foot of diametrical plane.

Formulas for Stability—When a structure such as a chimney is under a compressive vertical force (mass) only, the neutral axis or axis of rotation of a sectional plane or joint will be at infinite distance from the centre of gravity of the plane; the resultant force will pass through the centre of gravity of the plane, which will be subject to compressive stresses of uniform intensity throughout.

When the structure is subject to a lateral force (wind) in addition to the vertical force, the resultant will intersect the sectional plane at a point beyond the centre of gravity of the cross-section with the direction of the lateral force. The neutral axis or axis of rotation will approach the centre of gravity of the cross-section from the side of the lateral force.

The position of the axis of rotation in a plane is dependent upon the amount of the external forces, but dependent solely upon the location of the resultant of the external forces (mass and wind).

When the axis of rotation passes through the cross-section,

one side of the section, the windward, will be in tension, and the other, the lee, in compression.

When the axis of rotation passes by the section, the stresses are wholly compressive and uniformly varying in intensity, as should be the case in masonry structures in which tensile stresses are not permissible.

The resultant external force in masonry structures should never fall outside of the core of resistance of the cross-section. The quotient of any moment of inertia of a cross-section, in relation to the neutral axis passing through its centre of gravity, divided by the distance of the edge of the section from the neutral axis and the area of the section, is the distance from the neutral axis to a point in the bounds of the core of resistance. In a circular or circle ring plane the core of resistance is bounded by a circle. In a square or hollow square it is a square with its diagonal perpendicular to a side of the plane.

When the resultant of the external forces falls outside the core of resistance the axis of rotation will pass through the cross-section.

When it falls within the core the axis of rotation will pass by the cross-section.

When it intersects the edge of the core, the axis of rotation will be at the edge of the cross-section, resulting in null stress at the axis of rotation, or the edge through which it passes, and double the normal stress at the furthest edge.

Let fig. 2 represent a symmetrical pyramidal prism of a given mass or weight subjected to a lateral force W, j j being a joint or sectional plane.

- Let m = mass or weight of prism above joint j j,
- A = area of its diametrical plane or projection, and
- b and b₁ = width at base and top, respectively;
- G = centre of gravity,
- W = total lateral force acting at G, and
- h = distance from joint to G, or lever arm for W.
- x = distance from centre of gravity of cross-section to intersection of resultant R (of mass and wind).
- w = pressure of wind per square foot, 50 pounds for plane surface and 25 pounds for cylindrical or octagonal.
- w₁ = pressure per square foot a given cross-section will resist when the axis of rotation is at the edge of section.

$$W = w A; h = 1/3 H (b + 2b_1) \div (b + b_1);$$

$$x = W h \div m; w = x m \div A h; w_1 = k m \div A h.$$

If m and x are known, the next step is the determination of the resulting stresses and their character, acting at the joint.

Fig. 1 shows a joint, j j, and its sectional plan, a solid square being chosen, with its core of resistance cross-lined. Three diagrams are also shown giving graphically the stresses throughout the cross-section for different positions of the axis of rotation.

Let a = area of section, and
 g = centre of gravity,
 I = moment of inertia,
 r = radius of gyration,
 k = distance from g to core of resistance,
 $n-n$ = neutral axis of cross-section through g ,
 O = axis of rotation,
 s = distance from $n-n$ to edge of section, lee side,
 s_1 = distance from $n-n$ to edge of section, windward side,
 y = distance from $n-n$ to axis of rotation O ,
 d = distance from axis of rotation to any point where stress is sought,
 d_1 and d_2 = distance from axis of rotation to respective edges, e_1 and e_2 ,
 p = stress per unit of area at any point distance d from O ,
 p_1 and p_2 = maximum and minimum stresses respectively at edge e_1 and e_2 .

When x exceeds k , axis of rotation falls outside of section; p_1 and p_2 compressive stresses.

When $x = k$, $y = s$, d_1 and p_2 become null, and $p_1 = 2m \div a$.

When x is less than k , axis of rotation falls within the section; p_1 compressive and p_2 tensile stress.

$r^2 = I \div a$; $K = I \div s a$; $y = r^2 \div x$; $p = m \times d \div I = m d \div a y$;
 $p_1 = m \div a + W h s_1 \div I$; $p_2 = m \div a + W h s_2 \div I$.

When $m \div a$ is less than $W h s_2 \div I$, the stress is opposite in kind, or tensile.

It is interesting to compare the results given by Mr. Schumann's formulas for the diameter and height of a chimney for a given horse-power with the values given by the formulas of Professor Lang, published in the *Engineering Record* for July 20, 1901, and the values given in Kent's "Mechanical Engineer's Pocket Book." The comparison is shown in the following table:—

H.-P. at 5 lbs. Coal per Hour.	Schumann.		Kent.		Lang.	
	Diameter, Inches.	Height, Feet.	Diameter, Inches.	Height, Feet.	Diameter, Inches.	Height, Feet.
500	57	100	57	100	55	112
1,000	74	130	72	150	78	141
1,500	86	150	86	149	97	163
2,000	96	170	96	175	111	181
2,500	103	185	102	200	124	198
3,000	111	202	108	200	138	216
4,000	127	206	127	208	158	240

It will be noticed that the results given by the Kent and Schumann formulas are practically identical, while those given by the Lang formulas are considerably larger for the same horse-power.

THE STOCKPORT WORKHOUSE COMPETITION.

PLANS were recently obtained by competition of a new workhouse infirmary proposed to be erected for the Stockport Union on a site purchased many years ago by the Board of Guardians for the erection of a workhouse. The new infirmary committee considered the report of Mr. Thomas Worthington, architect, of Manchester, who had been appointed to examine the seventeen sets of plans sent in and award the premiums offered, when it was decided by a majority not to accept for the present any of the three premiated plans on the ground that the cost limit in the instructions to competitors had been exceeded. At a largely attended meeting of the Board on Monday, Mr. George Andrew (chairman) presiding, Mr. F. R. Morley pointed out that the Guardians asked for plans showing an infirmary of 322 beds at an estimated cost not exceeding 130*l.* per bed. The estimates for the three sets of plans selected by the assessor were as follow:—No. 1, 51,682*l.*, or 160*l.* per bed; No. 2, 47,322*l.*, or 147*l.* per bed; No. 3, 58,272*l.*, or 180*l.* per bed. A majority of the committee considered that to accept one of these three sets of plans without a further report upon the remaining fourteen sets would be an injustice to those competing architects who had kept within the limit of cost of 130*l.* per bed.

Mrs. M'Clure asked if it was not the duty of the assessor to throw out the plans that exceeded the cost limit. At any rate, she thought the Guardians ought to be informed as to which were the best plans within the cost limit.

The Chairman suggested that the Guardians should first decide whether they intended to follow up the resolution of the former Board and build at Stepping Hill, or whether they meant to provide increased hospital accommodation on the site of the present workhouse at Shaw Heath.

Mr. Morley and Mr. C. Sharples stated their readiness to support the Stepping Hill site, the last named contending that there was no other course possible since a piece of the available land at Shaw Heath had been purchased and cleared for the erection of a Catholic church.

Mr. John Bateman challenged the clerk to produce any correspondence in which the Local Government Board said

they must go to Stepping Hill, and said he was not satisfied that they could not get all they required at Shaw Heath at much less cost than was shown in the estimates before them.

An animated discussion resulted in a decision to suspend operations as to a new infirmary until the opinion of the Guardians on the question of site has been expressed.

THE BELFAST CITY HALL.

THE following report was lately submitted to the improvement committee of the Belfast Corporation by the architect of the new city hall. It shows the amount already authorised by the Council, and the suggested expenditures that the committee have had under consideration:—Authorised expenditure—Amount of contract, 149,864*l.*; increased height of building, 3,750*l.*; projection of public hall, 1,000*l.*; facing courtyard with stone, 3,114*l.*; additional emergency staircase, 1,600*l.*; expenses of laying foundation-stone, 520*l.*; heating and ventilation, 1,535*l.*; additional coal store, 500*l.*; basement under rates and gas offices, 500*l.*; additional steelwork and floor construction at ground-floor level, 1,000*l.*; entrance porch to public hall, 500*l.*; slurry, 500*l.*; total, 164,383*l.* Suggested expenditure—(1) Internal decoration of dome and principal staircase, &c., 16,932*l.*; (2) sculpture, 2,000*l.*; (3) increase in size and height of main entablature and balustrade, 2,000*l.*; increased height of dome, 2,500*l.*; (4) plumbing, 1,500*l.*; (5) additional joinery, &c., to public hall, 2,000*l.*; (6) gallery to public hall, 3,000*l.*; total, 29,932*l.*; grand total, 194,315*l.*

The following resolution was adopted:—"That the report of the architect be adopted, and that the Council be recommended to authorise the extra expenditure suggested, which will effect great and desirable improvements on the building." In bringing forward this recommendation the committee feel that it embraces all the improvements that are likely to be required, with the exception of some marble spandrels between the arches and ceiling in the hall, and hard wood in substitution for pine in some of the windows, involving an expenditure of about 1,000*l.*

TESSERÆ.

Interlaced Ornament.

OF the many interesting memorials of the past met with in parts of the Balkan Peninsula, not the least important are those interlaced slabs from the early churches of Knin. They belong to a style of decorative art once common among Christian communities throughout Europe and some parts of Asia and Africa. In the course of the distribution of this style over such an extensive area its details naturally underwent various modifications in the hands of different artists, especially those inhabiting countries far from the centre of its primary development, such as the Saxons, the Celts and the Scandinavians. Nowhere has this divergence been more marked than within the British Isles, so much so that at one time it was the current belief that interlacings were a creation of the Celtic mind. But wider observation has proved that interlaced patterns were introduced from the East by the same channels which gave access to Christianity. At the same time, it is not denied that in the hands of the Celts these designs, especially in combination with the pre-existing spirals and trumpet shaped spaces, have been manipulated in such a manner as to give their productions a remarkable individuality of character. There is now a consensus of opinion that this form of ornamentation originated in the Byzantine school, and thence spread throughout Europe, acquiring greater intricacy and significance as it reached the outward limits of Christendom. The continental specimens on stonework are broadly characterised by a division of the interlacing bands into three ridges, a feature which is extremely rare in the Celtic area, the band in the latter case being either plain or divided into two ridges. There is reason to believe that this simplification of the band, though in point of ornamentation it may be regarded as a backward step, was due to necessities imposed upon the artist in his efforts at greater elaboration.

Early Church Towers.

There is in the Bodleian Library at Oxford a manuscript of Cædmon's Saxon Paraphrase of the book of Genesis, which is decided by persons conversant with ancient autographs to be undoubtedly of about the year 1000, rather earlier than late but not exceeding fifty years of that period. It contains rudimentary drawings, some of which have been engraved; a copy is preserved in the library of the British Museum (intituled, "Figuræ quedam antiquæ ex Cædmonis monachi Paraphraseos in Genesin, 1754"). In the plate marked "pag. 59" is a church with a square tower and a spire upon it; there is also a porch at the side of the church. The spire, as well as the church, is covered with round ended shingles. This is not only evidence of shingles being an ancient practice, but also of

pires and porches having existed long anterior to the time usually allotted to their introduction. Bentham in his history of Ely Cathedral expresses an opinion that spires did not occur much before the year 1222, and Warton thought not before the year 1200. On the outside of the tower of Castor Church in Northamptonshire the stonework is cut in imitation of shingles. Dr. Stukeley speaks of this tower as being an ancient piece of architecture. The tower appeared to be much older than the rest of the church; the subsequent addition of the other parts was evident in the contiguous work of the walls.

Saxon Building.

The situation of Britain after being quitted by the Romans prevented the natives raising more than temporary buildings, and therefore little advantage could be taken of the superior examples left by the former masters of the world. How little people in an abject state are capable of profiting by the best examples before their eyes has been witnessed both in Greece and Rome, where, becoming subject to barbarians, architecture quickly degenerated to a correspondent rudeness. The produce will always be influenced by the demand. A superior intelligence in what related to building could not be expected from tribes of roving Saxons, and any little advance that might have been made in the arts after the settlement of the Saxons in Britain must again have been depressed by the long conditions with the piratical Danes. In buildings of what is called the Saxon period it is probable that, if any vaultings occurred, they were confined to small groins in crypts, having above ground no other than arched apertures in the walls and arches over the columns and piers. Of the ancient buildings erected in the simple manner that has been mentioned we cannot expect at this distant period to find many examples. A few remains of small buildings, appearing of a remote age, are in the walls long and narrow windows, being on the inside only a few inches in breadth, but are widely splayed thin, and are many feet in height. Some of the windows have semicircular-arched heads, and others are terminated at the top with a sharper curve on the outside, the inside being framed into a low circular segment that extends to the upper extremities of the splayed sides.

The English Town.

Formerly a wall seems to have been considered necessary to constitute a town, and the derivation of the word, in its Anglo-Saxon form "tun," is usually referred to the verb "tunan," to shut or enclose; in its Dutch form, "tuyn," it signifies a garden; and in its German form, "zaun," it means a hedge. In legal language "town" corresponds with the German "vill," by which latter term it is frequently spoken of in order to distinguish it from the word town in its popular use. A vill or town is a subdivision of a county, as a parish is a subdivision of a diocese, the vill, the civil district, being usually co-extensive with the parish, the ecclesiastical district, and, *prima facie*, every parish is a vill and every vill a parish. Many towns, however, not only in the popular but in the legal sense of the term, contain several parishes, and many parishes, particularly in the North of England, where (probably from the difficulty of obtaining a resident clergy in places exposed to hostile inroads) the parishes are exceedingly large, contain several vills, which vills are usually called tithings or townships. As, until the contrary is shown, the law presumes that parishes (or vills) and parishes to be co-extensive, Lord Coke goes so far as to say that it cannot be in law a vill unless it hath, or times past hath had, a church and celebration of Divine service, sacraments and burials. But this, for which no authority is given, appears to confound parish and vill, and to be inconsistent with the cases in which it has been held that a vill may consist of several vills. The test proposed by Lord Coke is that a vill must have a constable, and that otherwise the place is only a hamlet, an assemblage of houses having no official legal character. Hence a vill is sometimes called a stablewick. Towns are divided into cities, boroughs and towns, or (as we should now call them) country towns. Towns belonging to the last of these classes have been described as places which, though enclosed, are not governed by cities and boroughs are, by their own elected officers. The Anglo-Saxon "tun" terminates the names of an immense number of places in England; and in the southern counties a farm enclosure in which the homestead stands is usually called the barton (barn-town), in law Latin, *bertona*.

The Christian Altar.

The dimensions of the high altar are thus stated by Bishop Bevilacqua:—"Allowing then an altar of three foote and an halfe, and a rising to it from the lower floore of a foote high; height of the altar from the lower floore will be foure foote and a halfe, or three cubits, which is the measure required in Leviticall law, and differs little in height from the altars in other parts, or those which are yet standing with us, if we will take their height from the lower floore: which, by reason of the continued and easie degrees of ascent to them,

may not unfitly be counted their basis or foote." The authentic mark of an altar-table was its five crosses. As no altar could be consecrated without relics, there was a small stone, called the *Sigillum Altaris*, by which the aperture for insertion of the relics was closed up by mortar tempered in holy water. What are the horns of the altar has been doubted by Warton. They have been called the corners of the altar. Du Cange says the horn of the altar is the side where the epistle and gospel were read. Symmachus, Gregory of Tours and others mention the ciborium, an arch over the altar, supported by four lofty columns, in imitation of the Propitiatory, which covered the Ark. It was sometimes illuminated and adorned with tapers. Where there was no ciborium a mere canopy hung over the altar, which was most common among us, a fine stone screen full of niches being the back of the altar, from which the canopy projects. Curtains called the *Tetravelum* were annexed and drawn round, that the priest might not be confused by view of the spectators. Under this ciborium or canopy hung the *Pix*, or box containing the Host, commonly a dove of goldsmith's work, esteemed so sacred that upon the march of hostile armies it was especially prohibited from theft, and Henry V. delayed his army for a whole day to discover the thief who had stolen one. A common altar-piece was a picture of the General Judgment, called *Mappa Mundi*, but others occur. Over the altar was put the *Palla*, carried out against fires; and over the *Pall* the Corporal, always made of linen, according to an order of Sextus in the year 133. The *Antependium* was a veil which hung before, as the *Dorsale* behind. Behind and about the altar were *Perticæ*, or beams, ornamented at the great feasts with reliquaries of ivory, silver, &c. Besides *piscinas* were the stalls, where the officiating ministers retired during parts of the service performed by the choir. Du Cange says:—"The *Sedes Majestatis* is a seat by the side of the altar, in which the minister about to celebrate sits while the *Kyrie*, *Gloria* and *Credo* are sung; from whence, as often as he arose, the deacon, removing his hood, or amess, used to comb his hair, although that office is now done in the vestiare before he comes to the altar." The altar-plate stood upon a side table called *Credentia* or *Ministerium*.

Position of Architecture among the Arts.

Architecture, unlike all other arts, contains something in its nature which prevents it from being, properly speaking, art, or anything more than decoration in the highest sense of the word. Architecture alone of all the arts has no subject furnished by nature. To what end the most beautiful building, if it were not for use? In whatever way you consider it, the idea of utility in the most extensive sense is inseparable from this art; yet this is an idea utterly at variance with art. On the other hand, buildings give a pleasure which we should seek elsewhere in vain. As colossal works of man, the enormous mass of which is invested with a beautiful and intelligible form, they stand midway between the productions of nature, mountains, rocks, &c., and the mere offspring of the human fancy, statues, and combine the advantages of both. Even the idea of utility, which instantly attracts men, perhaps conspires to produce this result, so mixed is the common impression which a building makes. The artistical impression is, indeed, very different; but even this cannot be perfectly pure, and the question remains whether architecture is to be treated as a perfectly pure art and utility to be sacrificed. The utmost it can attain to is, as it appears, the æsthetic treatment of a subject belonging to a totally different domain. This, however, applies only to ornamental architecture.

Cyclopean Walls.

The Italian cyclopean walls are built with great irregular blocks of stone, made even on the face, or nearly so, not squared nor laid in regular courses, but the inequalities are fitted to each other as much as possible and the interstices filled up with smaller stones. In what is probably the earliest style of all no tool seems to have been applied to the stone, but the rude masses are merely heaped on one another, taking care in the position of each successive block to place it where it would most nearly fit into the work, and probably keeping the smoothest side outwards to form the face of the wall; but the work is always rude and uneven. In the second style, the tool has been used, more or less, in order to make the great stones fit with some degree of accuracy; and in both these one may easily conceive the use of the leaden rule described by Herodotus, which being bent to the internal angle left on the top of the wall would be applied to the external angles of the stone intended to be placed in it. In the third sort of cyclopean walls, lines nearly horizontal are decidedly more numerous than those in any other direction, and here and there are some appearances of level courses. These, in later times, predominated more and more, till in the fourth and last style the only irregularity is found in the unequal thickness of the stones of the same course, corrected sometimes by the introduction of a sloping line, or more often by a notch to let the larger stone into the course above or below.

GENERAL.

The Conversazione of the Architectural Association will be held in the Gallery of the Royal Institute of Painters in Water-Colours on Friday, the 25th inst.

The Annual Meeting of the Architectural Association of Ireland was held on Tuesday in Dublin, when Mr. Charles MacCarthy, the city architect, delivered his address as President.

Mr. F. Matcham has prepared plans for a new theatre and other works for the Buxton Gardens Company, which will cost 25,000*l*.

The Treasurer of Christ's Hospital states that the announcement which has appeared to the effect that negotiations have been reopened between the governors of St. Bartholomew's Hospital and of Christ's Hospital, and that there is a prospect of a contract for the sale to St. Bartholomew's Hospital of the whole site of Christ's Hospital being concluded in the near future is incorrect.

Sir John Aird, M.P., will go to Egypt at the beginning of December in order to prepare for the Khedive's inspection of the great irrigation works, which are now approaching completion.

The Light Railway Commissioners have decided to grant the application made at Halifax for an order to authorise the proposed line from Holmfild to Southowram. This is to be about 4½ miles long with several sidings, and is estimated to cost 63,618*l*. The engineer to the scheme is Mr. Myers, Beswick.

The Statue of Queen Victoria which was unveiled at the Alexandra Palace on Saturday has been presented to the trustees by the sculptor, Mr. Onslow Ford, R.A. It is a plaster cast of the statue in bronze which Lord Roberts on Wednesday unveiled at Manchester.

A Meeting of Citizens was held in the Council Chamber, Edinburgh, to consider a proposal to hold an international exhibition in Edinburgh in 1904 or 1905. A committee was appointed to consider the question of site, the year of exhibition and other preliminary points.

Mr. Walter Stanton, architect and surveyor, Chesterfield, died on Monday at the age of fifty-five. The deceased was for a number of years the borough surveyor.

An Isolation Cottage, erected on the principle of a bungalow, will in all probability be established as soon as possible for the use of the inhabitants of Arundel. The works committee of the Town Council have recently been negotiating with the Duke of Norfolk on the subject.

A New Chapel was dedicated at Brislington last week. The plans were prepared by Mr. Frank Wills, and the building has been erected by Messrs. W. Cowlin & Son. The complete plans provide for a building to seat 700 worshippers on the ground-floor, and 110 in an end gallery, with a schoolroom adjoining to accommodate 150 children. The cost, including the site, has been about 4,000*l*.

The Hermione Lectures will begin on October 14 at Alexandra College, Dublin. They will be given by Dr. Waldstein, who is to take as his subject "Greek Art." In his first lecture the lecturer will take a survey of the peculiar character of Greek art as elucidated by the discoveries made in the last ten years. The remaining three lectures will be devoted to describing the excavation of the American school at the Argive Heraeum from 1892 to 1895.

Mr. W. A. Richardson having tendered his resignation as water engineer to the Birkenhead Corporation, it was decided to appoint him consulting water engineer, at a salary of 300*l*. per annum.

Mr. B. T. Batsford will issue early in November a revised and enlarged edition of "A History of Architecture on the Comparative Method," by the late Professor Banister Fletcher and Mr. Banister F. Fletcher. This edition has been revised and considerably enlarged by the junior author, and includes the Saracenic and Eastern styles. It now has 256 full-page plates, one half being from photographs of buildings, the other from specially prepared drawings of constructive and ornamental detail, including over 1,300 illustrations.

The Sussex Archeological Society will discuss at their next Council meeting a proposition to establish a national fund with the object of purchasing Battle Abbey. It is proposed to use the mansion as a county museum and library.

The Local Government Board has appointed Mr. James Green (Weatherall & Green) as valuer of the various properties alleged to be "bettered" by the London County Council in connection with the Westminster Improvements and the Thames Embankment Extension.

The Surveyors' Institution have now issued their calendar and list of sessional arrangements from November 1901 to May 1902. The first ordinary general meeting of the session 1901-2, will be held on Monday, November 11, when the president Sir John F. L. Rolleston, M.P., will deliver an opening address.

The Brighton Corporation have decided that Mr. A. R. Tiltman's commission on the expenditure on works at the Aquarium shall not exceed 1,250*l*., being 5 per cent. on the sum proposed to be spent.

M. Denys Puech executed a bust of the Czar at a few days' notice from a collection of pictures and portraits. The work was a commission from the French President, who made it present to the Russian monarch.

The Westminster Ratepayers passed a resolution on Friday declaring that action of the Westminster City Council in the matter of the paving contracts was open to most serious objection, first, in regard to their acceptance of the Improved Wood Pavement Company's tender, and secondly, in regard to the adoption of American red gum, and recommending that the contract entered into with the company be rescinded, and that the suitability of American red gum for street paving should form the subject of special and expert inquiry, pending which any further paving operations with it be stopped.

The Department of Records in Ireland has come into the possession of a large map of the "Government of Athlone," which, with other maps and manuscripts of the Headfort collection, was acquired by the Commissioners of Woods, Forest and Land Revenues in 1837 from the representative of Sir Thomas Taylor, who was deputy surveyor-general of Ireland in the reign of Charles III.

A Series of fire tests on tile and plaster blocks and thin metal-plaster partitions have been conducted by the Department of Buildings of New York City.

The Louisiana Purchase Exposition to be held in 1904 will, it is stated, be larger than any previous exposition in Europe or America. About 11,000,000 dols. will be expended for construction work. It is planned to apply about 7,000,000 dols. of this amount for the buildings and 4,000,000 dols. for the grounds. The general plans have been drawn up by a commission of architects.

A Tablet in memory of Christopher Anstey, the satirical poet of the eighteenth century, author of the "New Bath Guide," has been recently affixed to 5 Royal Crescent, Bath, where he lived for thirty-five years. The inscription reads, "Here lived Christopher Anstey, 1770-1805."

The Foundation-stone of a new Catholic church to be erected in the Mile-end Road was laid by Cardinal Vaughan on Saturday. The building is being erected from the designs of Mr. Walters, and will, when completed, accommodate 600 worshippers. It is in the Perpendicular Gothic style and will cost 11,000*l*.

Mr. Adrian Jones has completed the clay model of the monument which is to be erected to the memory of the Royal Marines who fell in China and South Africa. It represents two Royal Marines, one lying on the ground wounded, while the other, erect and determined, faces the enemy with fixed bayonet. On the sides of the pedestal will be displayed the regimental badge and motto and the names of the fallen heroes, while at each corner a dolphin will be placed. It is hoped that a suitable site near the Admiralty will be allotted for the memorial.

The American Institute of Congress opened their thirty-fifth annual convention on October 3. Papers were read on "Some Phases of Exposition Making," by Mr. Carleton Sprague; "The Management and Design of Expositions," by Mr. Thomas R. Kimball; "The Exterior Colour Effects of the Pan-American Exposition," by Mr. C. Y. Turner; "The Electrical Installation and Decorative Effects of the Pan American Exposition," by Mr. Luther Stieinger; "Government Architecture at Expositions," by Mr. E. A. Crane.

The Northern Architectural Association will hold a excursion meeting to-morrow, the 12th inst., at Newcastle. Members will assemble at the Newcastle Breweries Office, Haymarket, at 3 P.M., and after inspecting these buildings will visit the electric power station.

The Rev. H. P. Gurney, principal of the Durham University College of Science, Newcastle, in his report has stated that the fund for the completion of the college building amounted to 51,000*l*. The suggestion of their treasurer, Dr. Hodgkin, that a suitable memorial to Lord Armstrong would be to erect a statue upon some prominent site, and to dedicate the college to his memory, had received the hearty support of Mr. Watson-Armstrong, and was cordially adopted by the Council. They resolved to ask the University to consent to change of name, and to invite subscriptions to an Armstrong memorial fund. A public meeting was held, and resolution were adopted approving of the scheme. Upwards of 20,000*l* was promised at that meeting.

St. Peter's Church, Bristol, having been subjected to very complete course of restoration, at a cost of 3,500*l*., was reopened on Sunday last. The restoration has been in hand some nine years, and the money was expended in the following manner:—1,200*l*. upon the tower, 900*l*. upon the south wall, 400*l*. upon the heating apparatus, and 1,000*l*. upon the interior

THE

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BEXHILL—Nov. 23.—The Bexhill Urban District Council invite competitive designs for laying-out about 12½ acres of land as ornamental grounds. Premium of 20*l.* offered for the selected design. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

ST. PANCRAS BATHS.

THE handsome and substantial baths and washhouses which have been erected by the borough of St. Pancras at a cost of 93,000^l., were opened on Wednesday. The architect of the new building, which is constructed to serve the requirements of 50,000 people, is Mr. T. W. Aldwinckle, and the builder Mr. C. Wall, of Chelsea. The structure has good frontages to the Prince of Wales's Road and two other roads, and includes within its external walls four swimming-baths, 129 slipper-baths, and a washhouse with fifty washing compartments. During the winter the bath will be boarded over and the hall let for entertainments and meetings, it having seating accommodation for 1,200 persons. Lady swimmers have also been carefully provided for. The painting of the whole of the interior, which presents a bright and cheerful appearance, has been carried out in Ripolin, and Messrs. Tom Jones, Lock & Co. have provided their patent gearing for opening the fanlights, and also the bar handles and plates to the doors.

TRADE NOTES.

WE have been requested to state that Messrs. Wm. Mallinson & Co., timber merchants and importers, of Hackney Road, N.E., have at the present time a very large stock of bone dry Cuba mahogany from seven to eight years old.

THE new Board schools, Fenny Stratford, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Roden Convalescent Home, for the Wholesale Co-operative Society, Limited, has been fitted with the latest improved low-pressure hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, employing their "Rahnee" radiators and "Rex" radiator valves.

MR. HENRY G. MURRAY, church decorator and stained-glass artist, late of 155 Buckingham Palace Road, S.W., informs us that, in consequence of his premises being required for the Victoria Station improvements, he has removed his office and studios to Britannia Studio, 11A Caroline Street, Eaton Square, S.W., two minutes' walk from Sloane Square.

MR. SAM DEARDS, of Harlow, has been favoured with contracts for his patent glazing on the roofs of the buildings for the Wantage Engineering Company; Messrs. Hooker's factory, Walthamstow; the Electric Light Works, Lewes; Messrs. Brand & Co., Mayfair Works, London; for His Majesty's Military Prison, Aldershot; and for Messrs. Crompton's Arc Works, Chelmsford.

THE London Fireproof Platewall Company are now erecting their smooth-faced platewall partitions, which require no plastering, at the new premises of the South-Western District Post Office, Howick Place, S.W., for H.M.'s Board of Works, and have recently completed similar partitions for the London County Council at their new offices in Cockspur Street, Charing Cross, S.W.

A NEW eight-day turret clock showing the time upon one external copper dial 4 feet in diameter, to the design of Mr. T. G. Jackson, architect, 14 Buckingham Street, Strand, London, has been erected in the new cricket pavilion, Giggleswick, the work having been executed by Wm. Potts & Sons, clock manufacturers, Guildford Street, Leeds, and Newcastle-on-Tyne, for Mr. W. Morrison, J.P., Malham Tarn, near Settle, Yorks.

ELECTRIC NOTES.

THE appointment of electrical engineer at Dewsbury has been given to Mr. Campion, electrician, in the employ of the Blackburn Corporation. The salary commences at 300%.

AT a meeting of the York City Council the electric-lighting committee recommended the Council to authorise them to expend 50,000% for further extensions of the plant, &c., and the recommendation was approved.

AT Coventry Mr. E. A. Sandford Fawcett, Local Government Board inspector, held an inquiry into an application of the Coventry Corporation to borrow 23,200% for electric-light extensions, 17,275% for street improvements and sewerage, and 2,350% for street improvements. There was no opposition.

VARIETIES.

THE Skipton Urban Council have advanced the salary of the surveyor, Mr. John Mallinson, from 150% to 200%.

THE Clacton Urban Council have under consideration the question of procuring a site for the erection of municipal buildings.

A NEW wing which has been added to the Sunday schools in connection with Perry Barr Wesleyan chapel, Aston Lane, Birmingham, was formally opened on Tuesday afternoon.

THE new Catholic church at Castlebar was solemnly dedicated on Sunday, the 6th inst., by his Grace the Archbishop of Tuam.

THE Governors of the Yardley Charity Estates, at their meeting on Monday morning, received a recommendation from the almshouses committee to build the new almshouses on land adjoining the girls' school at Yardley.

A DESIRABLE public improvement is being urged on the local authorities of Kensington and Hammersmith, viz. the formation of a new road in continuation of Blechynden Street, North Kensington, under the West London Railway, and thus connecting Latimer Road with Wood Lane. The estimated cost is 8,800%.

THE Bexhill terminus of the South-Eastern Railway is rapidly approaching completion, the Sidley station, one mile from Bexhill, having been finished some time since. It is expected that the line, which will connect with the South-

Eastern main line near Battle, will be open for traffic in a month or so.

THE newly built cottage hospital in Grape Lane, Whitby, intended to take the place of the temporary hospital in Church Street, is now open. The old premises of the York Union Banking Company in Baxtergate were purchased for 700%, demolished, and a modern building erected at a cost of about 1,100%, towards which about 300% is still required.

ON the 5th inst. St. Gabriel's Episcopal church, Greenfield Street, Govan, was dedicated. It is of plain Norman style of architecture, and built of red pressed brick, with white stone facings. Adjoining is a hall, which can be so arranged as to form a north chancel. The church is seated to accommodate 300, and the hall 170 persons. The buildings have been erected at a cost of 2,000%, from plans prepared by Mr. James Chalmers, architect, Hope Street, Glasgow.

THE Glasgow Architectural Association held its first meeting for session 1901-2 in their rooms, 187 Pitt Street, on the 1st inst., when Mr. Chas. E. Whitelaw delivered his opening address. There was a good attendance of members. The office-bearers for the session are:—Messrs. Charles E. Whitelaw, president; Wm. J. Blain and James Lochhead, vice-presidents; Alexander N. Malcolm and Wm. J. Lukeman, hon. secretaries; William Haldane, hon. treasurer; D. Bennet Dobson, hon. librarian.

EMPLOYÉS of the Birmingham estates committee are engaged upon retiling the roof of the Council house. The tiles with which the building was originally covered have been found to be of a soft nature, and atmospheric action causes them to perish. Frost flakes them and makes them porous, and consequently recently numbers of small leaks have been found in various places. It has therefore been decided to adopt a different make and pattern. Part of the roof has already been taken in hand, and any unperished tiles which may be stripped from it will be used in repairing the old portion of the roof. It is intended gradually to replace the old by the new pattern over the whole of the roof. The work done in this manner will not throw any heavy expense on the rates.

THE church of St. Botolph, Stow Longa, Hunts, dating from Norman times, and containing work of all the succeeding centuries, was reopened on Wednesday, October 2, by the Lord Bishop of Ely, after rebuilding of the clerestory and nave and aisle roofs from designs by Messrs. John & S. Inskip Ladds, joint architects, of 7 Doughty Street, W.C. The new

The POLICYHOLDER'S COMPANY

A POLICYHOLDER'S TESTIMONY.

In acknowledging the receipt of a Cheque for £3,883 6s. 5d. in settlement of Endowment Policy No. 453396 for £3,000, showing a bonus of nearly 3 per cent. per annum for 10 years, the Policyholder writes:—

"Had I taken a fully paid-up Policy instead of the above amount in cash it would have been £257 in excess of the figures given to me when I took out the Policy 10 years ago. I have given expression to my satisfaction by taking out a fresh Policy in your Company for £10,000 on the Endowment plan."

16, 17 & 18 Cornhill, London, E.C.

D. C. HALDEMAN, General Manager.

clerestory is based upon the fragments of the former one, which were found during a previous restoration. It is of Early Perpendicular character, and has been erected in Weldon stone by Mr. Henry Ashley, of St. Neots. The new roofs are of English oak; that to nave is of hammer-beam construction, and into the three middle principals the old tie-beams of the late roof (which was of debased seventeenth-century character) have been framed. The roofs of aisles are quite plain, except at eastern end of south aisle, where a side chapel has an ornamental ceiling. The nave is covered with tiles and the aisles with lead, and a new wood-block floor has been laid. The work has cost 1,150*l*.

BUILDING AND BUILDERS.

THE memorial-stone of the new Prestonfield Church, in Dalkeith Road, Edinburgh, was laid on the 4th inst.

PLANS have been passed by the Hornsey District Council for the completion of a Catholic church at the corner of Womersley Road and Dashwood Road, Stroud Green.

THE foundation-stone of a new church, which is being erected for Melville United Free congregation, Aberdeen, was laid on the 5th inst.

THE memorial-stone was laid on the 5th inst. of a new chapel for the Primitive Methodist Connexion at Knaresborough. The buildings are expected to be completed about next June. The estimated cost is 3,500*l*.

AT the monthly meeting of the Warrington Town Council, it was announced that the Local Government Board has sanctioned the borrowing of 10,000*l*. for the provision of a smallpox hospital, 8,702*l*. for the extension of the fever hospital, and 3,000*l*. for the extension of the public baths.

AT a largely-attended special meeting of the shareholders of the Buxton Gardens Company, a scheme presented by the directors for a new theatre was, after a little discussion as to style of architecture, unanimously adopted. The new building will cost 25,000*l*., including a reconstructed entrance to the gardens.

THE foundation-stone of the new church of St. Nathaniel, Crookes Moor, Sheffield, was laid on Monday. This church, a portion of which is to be consecrated for service on June 30 next, will be the centre of a new parochial district taken from the parish of St. Philip's, and will comprise a population of 8,000 persons.

THE foundation-stone was laid on the 5th inst. of Melville United Free church, Aberdeen, which is being erected on the corner site on the south side of Skene Street, at its junction with Rose Street. The design, which has been furnished by Messrs. Brown & Watt, architects, is of a Classic character, the feature of the building being the graceful campanile that rises to a height of 120 feet at the corner of Skene Street and Rose Street. The principal elevation, which is towards Skene Street, is finished with a pediment over the centre compartment. The main entrance is by the tower. Internally the arrangements are very complete, and with its galleries the place will seat 760 worshippers. Satisfactory provision has been made for lighting (which will be by electricity), heating and ventilation. Along the Rose Street elevation extends ample hall, classroom and other accommodation. The two principal elevations and the four sides of the campanile are to be built of white Kemnay granite. The total cost of the buildings will be over 7,000*l*.

ONE is always sure of finding a capital entertainment at the Palace Theatre, the shareholders in which, by the way, have just been gratified with a dividend of 20 per cent., thanks to the generous policy which Mr. Charles Morton so consistently pursues. The biograph, which at this establishment has become a standing dish in the bill of fare, has just been reinforced by some strikingly interesting pictures of the Danish Royal Family, as recently gathered together at Fredensborg. There are four series of these pictures, the first film representing the arrival at Helsingor of King Edward VII. in the uniform of an admiral. Another film shows thirty-two sovereigns or princes of the Imperial and royal houses of Europe walking in a sort of informal procession in the gardens of Fredensborg, the King of Denmark leading, and walking arm-in-arm with his daughter (Queen Alexandra). King Edward, the Czar, the King of Greece, the Hereditary Prince and Princess of Denmark, the Dowager Empress of Russia and the reigning Empress of Russia are also present, and all appear to be having a good time. In another are seen the Grand Duchesses of Russia and the Princesses of Sweden and Norway playing in the private garden of Fredensborg Castle, some of their august relatives looking on or joining in their game; and the final film depicts the departure of the royal visitors. The programme contains many other attractive items, the most appreciated perhaps being Miss Esmé Beringer's delightful fencing sketch.

NEW ART GALLERY AT BURY.

ON Wednesday the Earl of Derby opened the Bury (Lancs) Municipal Art Gallery and Public Library. This handsome building has been erected from designs by Messrs. Willoughby & Woodhouse, of Manchester. The foundation-stone was laid on April 29, 1899, and the building has now been completed at a cost of about 30,000*l.* It stands at the corner of Moss Lane and Silver Street, forming a block about 100 feet square. The site is well chosen, for the new gallery is not only near the centre of the town, but, being in a fairly wide street with a small open space on one side, can be viewed to advantage. The architects have made good use of their opportunity, and have designed an imposing structure, faced with stone, in the modern Classical style, with a portico on each of the two street fronts. The broad, flat wall-spaces are relieved by double rows of columns and a frieze sculptured in low relief. As seen from either front the building is certainly dignified and effective, and forms a welcome addition to the street architecture of Bury. The library, containing about 12,000 volumes and fitted with the latest improvements, occupies the ground floor. On the first floor, approached by a stone staircase from a circular hall intended for sculpture, are five large galleries for pictures and other works of art. All these rooms are exceptionally well lighted, and the dull red colouring of the walls makes an excellent background for the pictures.

NEW CATALOGUES.

THE great variety of purposes and practical uses to which the novel lighting system of the Electric Lighting Boards Company, Ltd., can be applied are admirably illustrated in the company's recently-issued catalogue and price list. Of the practical utility of this system we have already had occasion to speak, and we are pleased to see that our prophecy as to the speedy recognition of its many merits has been more than justified, as it has been largely adopted in France in connection with the National Fête, and also on the occasion of the Czar's visit, and in the colonies in the decorations in honour of the visits of the Duke and Duchess of Cornwall, while in London it has been installed on a liberal scale at the Theatre Royal, Drury Lane, Royal Opera House,

Covent Garden, London Hippodrome, Shaftesbury Theatre, Oxford Music Hall, Lyric Theatre, Crystal Palace, Sydenham, Grafton Galleries, Cookery Exhibition, London, &c., as well as many other establishments, both public and private, while it has been welcomed with equal favour in the provinces. We may, perhaps, add that owing to the rapid increase of their business the company have now taken possession of a large double factory in York Road, where business operations will be commenced on a large scale, both for the Metropolis and our provincial centres.

MESSRS. S. CLARK & CO., of Park Street Works, N., have sent us a neatly got up and well illustrated catalogue of their well-known "Syphon Stoves." As is pretty generally known, the installation of these handy and effective stoves is essentially simple, and the amount of gas which they consume is, relatively, phenomenally small. It is, in fact, claimed that they produce the heat of a coal fire at the cost of one penny for three hours' burning. The heat produced is pure, equable and agreeable, and can be graduated or sustained at the will of the user. They are so constructed that a moist or dry atmosphere is obtainable at pleasure. The action of the stoves is under perfect control, as the heat can be increased or diminished by simply turning the supply tap. They are perfectly safe for conservatory use, and are strongly recommended for bedroom and sick chambers. Oil stoves on the same principle are also a specialty of the firm.

MR. JOSEPH FISHBURN, of High Wycombe, is the inventor and patentee of a labour-saving apparatus for the use of builders, which is steadily gaining ground in the favour of contractors and other large and small employers of building labour. The apparatus in question is known as Fishburn's patent labour-saving winch, and its object is the raising of loads of bricks, mortar, stone, slate, or, for that matter, any ponderous bodies of materials to the top or other intermediate stage of a scaffold, in place of its being carried in the old manner by a labourer climbing a ladder. That the winch in question has caught a firm hold on the fancy of those in a position to turn it to practical use is evidenced by the rapidly extending radius of the circle in which it is being employed, and we think that those builders who are not already acquainted with it would do well to apply for a descriptive catalogue.

WOLVERHAMPTON NEW WESLEYAN CHAPEL.

THE new Wesleyan chapel, which is being erected in Darlington Street, Wolverhampton, may now be considered as practically completed, a few minor finishing touches only being required. It is an architectural ornament to the leading street in which it stands, and from whichever way it is observed it has a pleasing appearance. While red-pressed brick has been mainly used in the exterior walls, the stone dressings have been interspersed in a manner to make the front and side in School Street present a very attractive addition to the thoroughfares, and two turrets in front of the massive dome in the rear add to the beauty of the building. Inside the chapel has been made light and graceful. The decorations are mainly white, with blue mosaic at the dome. The ceiling is a lofty arch supported by two rows of pillars, and flanked by smaller arches forming aisles for the length of the worshipping portion of the chapel. At the lower end the light from the dome is thrown upon the rostrum. A gallery runs round three sides, and is circular at the Darlington Street end. It is handsomely designed and worked in oak, the pillared balustrade being intersected by chastely-designed oak panels. The rostrum has a circular railing immediately in front, and is approached by a staircase. On either side parallel with the rostrum are two transepts. The seating on the floor level takes the form of modern pews facing the rostrum, with cross seats at the side. Upstairs the galleries are filled with rows of chairs, and in the children's gallery are benches. The building is so arranged as to be well lighted in the day-time, and at night electricity will be used as the illuminant. In the basement are vestries, classrooms, with kitchen and cooking-range, &c., together with choir-room and other apartments.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, October 7, Mr. Charles Mason, president, in the chair, a paper was read on "Preliminary Investigations for Water Supply," by Mr. Sydney A. Hollis.

The author first pointed out the difficulties which were encountered by engineers in tropical and sub-tropical countries in the gaugings of rainfall and rivers. Some statistics of

remarkable and erratic rainfalls in the Cape Peninsula were given. The author then gave a detailed account of the gaugings carried out by him at Steenbrass river, Cape Colony. He stated that the gaugings were taken with a view to the ultimate formation of a large storage reservoir by means of a dam across the mouth of the valley, the object being to obtain a supply of water for some of the suburbs of Cape Town. A large gauge weir was erected, measuring 60 feet across, and it was found that the flow of water in the river fluctuated between half a million gallons and 300 million gallons in the twenty-four hours. A description was given of the river gauges constructed to measure the flow of water in winter and summer, with particulars of the number and position of the rain and evaporation gauges.

A paper was also read on "Irrigation Works in South Africa," by Mr. J. Freebairn Stow.

The author first referred to the report of the Royal Commission on the settlement of time-expired soldiers and others in South Africa on the conclusion of the war, and pointed out that the Commissioners were strongly impressed with the value of irrigation works being undertaken in order to convert the vast area of dry veldt into an agricultural site, capable of providing produce for intending settlers. The author then drew attention to the persistent attempts made in 1886 by the late Mr. H. S. Orpen, at that time surveyor-general of Griqualand West, to induce the Government of the day to take up the subject of irrigation works.

The author then described the first scheme of irrigation ever attempted in South Africa on a large scale, and referred to the failure which attended the project. He then gave an account of the scheme prepared by Mr. Litchfield for irrigating the veldt in the vicinity of Douglas, a town about 80 miles to the south-west of Kimberley. The author then described the ingenious and somewhat rough and ready means adopted for the construction of the masonry dam across the Vaal river, and pointed out the engineering difficulties encountered. The employment of convict labour was referred to, and stress was laid on the benefits which accrued therefrom. The use of explosives in the blasting operations, necessitated by heavy rock cuttings, and the methods adopted for crossing the valleys and running the canal round the kopjes were described, and the difficulty of insuring a safe passage across or under the irrigation canal for storm water from off the numerous kopjes was also discussed. The manner in which the last sections of the masonry dam were built in was described, and the author

LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c. Cost of the Winch covered in a few weeks.

This Machine will be found invaluable in Warehouses, Factories, Maltings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building.

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and Safety.

gave examples of the way in which engineering work in a rough country was carried on, and how plant and material were transported where railways were unknown. In conclusion, he referred to the favourable attitude of the Government of Cape Colony in respect of irrigation works.

FREE LIBRARY AND TECHNICAL INSTITUTE AT GOSPORT.

THE new Free Library and Technical Institute which has been erected in Gosport at an outlay of between 7,000*l.* and 8,000*l.*, was formally opened on the 25th ult. It is well situated at the corner of Clarence Road South, and faces the Thorngate Hall and the Urban District Council's offices.

The public entrance to the free library department is placed in the centre of the Walpole Street façade, the entrance porch giving direct access to the lending library, the reading and news-room, the reference reading-room and the librarian, whose centrally placed office affords every facility for the efficient supervision of all the rooms comprised in the library department.

The rooms in the art department, occupying the whole of the first floor area of the front, or Walpole Road elevation, have been carefully arranged in accordance with the requirements of the Science and Art Department. They are lighted by means of windows and skylights, placed in the north wall and in the roof of the front block.

The technical institute is placed in the return block facing Clarence Road. In designing this department due consideration has been given to the possibility of the rooms being required for the purposes of a day science school. The accommodation provided comprises the following rooms, viz. on the ground floor, a physical laboratory, a chemical laboratory and a classroom; and on the first floor, a cookery-room and two large classrooms. The caretaker's rooms are placed in the upper stage of the tower.

The works have been well carried out by Messrs. Rashleigh & Son, of Southampton, under the immediate supervision of Mr. H. Frost. The architect, whose admirable design was selected in a limited competition, is Mr. A. W. S. Cross, of 58 Conduit Street, London.

A modelled plaster frieze over the library entrance was designed and executed by Mr. F. E. Schenck. The centre portion depicts the landing of Henry de Blois on what is now the Gosport

shore, and the east and west panels are emblematic (1) of Henry Cort, whose works were situated on Gosport Green and by the river Meon at Funtley, about 1785; he was an inventor, who discovered the process of converting hard pig-iron into a soft and malleable condition. And (2) of the Lady Alwara, the wife of the Saxon Thane Leowin, from whom Alverstoke is said to get its name.

LEICESTER COUNTY ASYLUM.

IN 1897 the Leicestershire County Council sanctioned a proposal to build an asylum for 600 or 700 patients at a cost of 120,000*l.*, and the visiting committee of the Leicestershire and Rutland Asylum were authorised to recommend a suitable site accordingly. The Lunacy Commissioners reported favourably on a site lying between Narborough and Enderby, and the Councils concerned warranted the purchase of the estate. The Government Departments assenting, the land has been acquired by the authorities. Messrs. Everard & Pick were appointed architects, and the buildings sub-committee of the principal committee have visited several recently-erected asylums so as to obtain at first hand the fullest information. The investigations made in this and in other ways has led to the discovery that the preliminary estimate passed by the Councils is quite insufficient for the purpose in view. The improved methods in the treatment of the insane cost more, the provision of suitable accommodation for the staff is more expensive, while the price of material has gone up. When the asylum is completed it will have cost 300*l.* per bed. In some places this amount has actually been considerably exceeded, and it has been pointed out to the committee that the initial proportionate cost per bed must of necessity be higher, owing to the fact that the administration buildings are provided for the higher number of patients to be eventually accommodated, instead of the smaller number for which provision may be completed at first. The Lunacy Commissioners have advised that accommodation should be made for not less than 650 county patients, and that administration departments should be designed in view of future extensions. After consideration the committee have decided to recommend that an asylum should be built for 628 county and 60 charity and private patients, 688 in all, instead of 600, as first suggested in the report of 1897, and they think it will be the wisest economy in the end to put up administration buildings for 900

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

or more patients. Estimates carefully prepared show that nearly 95,000*l.* will be required for the patients' buildings, upwards of 26,000*l.* for the official blocks, and 27,000*l.* for store-rooms, kitchens, workshops and so forth. Other necessary expenditure brings up the total to 261,148*l.*, to which a sum of 20,000*l.* must be added for contingencies, making 281,000*l.* in all, against the 130,000*l.* or 140,000*l.* which was in the minds of the committee four years ago. Of this sum Leicestershire will have to shoulder eight-ninths and Rutland the remainder but against this must be placed the proceeds of the sale of the present asylum, while the present cost of boarding out patients will cease, and the taking in of outside patients should produce a considerable profit. The position of the existing charity in view of the new asylum has been the subject of careful thought, and it has been arranged, subject to the approval of those concerned, that two blocks of suitably furnished buildings, each to hold thirty patients, be erected at Narborough, separate from, but connected by corridors with, the main building, two-thirds of the cost to be defrayed by the charity, and the remaining third in the proportion of one-ninth from Rutland and the remainder from Leicestershire. A sum of 5,000*l.* owing by the two counties to the charity is to be taken in part payment. The County Councils of the two shires will be recommended to sanction an expenditure of 241,278*l.* in the erection of the new asylum at Narborough, and that application be made to the Local Government Board to authorise a loan for the necessary works.

THE WIDENING OF PICCADILLY.

THE improvements committee of the London County Council, in a short report on the proposed widening of Piccadilly between Hyde Park Corner and Walsingham House, remark that the Council agreed on October 9, 1900, to adopt a proposal made by the First Commissioner of Works, and on July 23, 1901, the Council referred the working drawings, specifications and estimate of the cost, 29,400*l.*, to the manager of the Council's works department with a view to carrying out the paving and other work without the intervention of a contractor. At the beginning of the Council's recess, however, when tenders for the necessary materials had been obtained by the manager and the workmen had begun to stake out the land, a letter was received from the First Commissioner as follows:—"House of Commons, August 16, 1901. Dear Mr.

Torrance,—You will, of course, have followed the correspondence and articles which have appeared in the Press during the last two or three weeks in regard to the Piccadilly widening, revealing a large amount of misconception on the subject, for which I confess, after the explanations which appeared last year and the reception then accorded to them, I was unprepared. I have found it impossible to avoid a pledge to have the work postponed, and I have been in communication in that sense with the clerk to the improvements committee. You may be assured that I have taken this course with great reluctance and regret, more especially in view of the public-spirited and loyal manner in which the London County Council has accepted and adhered to the proposal which emanated from my department. I have a very lively sense of the consideration which I owe to the Council in the matter, and it is my intention, after a short interval for further deliberation, to consult the Council on its reassembling as to the course to be pursued. You will see in to-morrow's papers a report of what I have said to-day to a deputation which has come to me on the question.—Yours very truly, A. Akers-Douglas." The Chairman of the Council replied as follows:—"County Hall, Spring Gardens, S.W., August 17, 1901. Dear Mr. Akers-Douglas,—I am much obliged to you for your letter of the 16th inst., explaining so clearly the action you have felt compelled to take in connection with the proposed widening of Piccadilly. I fully agree with you that it is very unfortunate that so many who have written to the Press recently have done so from a misapprehension of the facts, but no doubt the short postponement of the work as suggested by you will enable them to ascertain the true position of affairs. Your statements to the deputation which waited upon you yesterday, and the letter from the chairman of the improvements committee in the *Times* to-day, will undoubtedly make the case clear to any one who follows the subject. I shall have much pleasure in asking the improvements committee immediately after their recess to give very careful consideration to anything you desire to bring before them upon the subject.—Yours very truly, A. M. Torrance." The committee, after submitting the correspondence, state:—"We are seeking an interview with the First Commissioner, and we propose to submit to the Council at the next meeting a full report stating in detail all the facts connected with the improvement. This being so, we refrain for the present from either explaining the merits of the scheme or commenting on the postponement of the work."

The "ONE" Range.

PATENT 1331/01.

**ASSOCIATION OF MASTER HOUSE PAINTERS
AND DECORATORS.**

THE eighth annual convention of the National Association of Master House Painters and Decorators of England and Wales has been held in Leicester.

The mayor (Alderman T. Windley), on behalf of the town said he offered them a very cordial welcome to Leicester. The Association came among them at a time when the town was passing under a cloud occasioned by the sudden and altogether unexpected death of their late Chief Magistrate. He trusted that their meetings would tend to the advantage of the Association, and ultimately to the public good. He was specially pleased to see that one of the objects of their Association was to stimulate and arouse a spirit of emulation on the part of the apprentices in the trade, and by means of prizes and competitions to educate them and make them more proficient in the art of painting and decoration for which they were being trained. That was an object which must command universal approbation and approval.

Sir John Rolleston, M.P., said he felt it to be a great compliment to be asked to associate himself with the Mayor in the cordial welcome which he had extended to the National Association of Master House Painters and Decorators. Among the signs of progress to which his worship had referred, and which were visible on every hand, was the improvement in house-decoration. It was visible not only in the palace and the castle, but in the houses of the people. They recognised that this was very largely due to the skill of the members of their Association. There was no doubt that the taste of the public was conforming to colour and good ornament, and although much had been done in the past there was still room for greater improvement, and this convention and exhibition were steps in the right direction.

Mr. J. Barker said that since his appointment to the office of President he had had in view one purpose, viz. to make the Association strong in helpfulness and usefulness to its members, and to those engaged in their service. This brought him to a most important point in their work—the proper training of their boys. If he could stir up a desire within them to do all they possibly could for the boys entrusted to their care he should feel that one element of progress had entered into their work, and was laying the foundation of future success. He feared the spirit of the age exhibited too much indifference, and the sooner they woke up to this fact the better. No one could walk along the streets or main roads of our cities and large towns any evening without this fact being brought very forcibly to their notice. The only road to success was by careful study and application and the utilising of every spare moment. Were they as masters and leaders taking the pains to enlarge their ideas and enrich their experience as they ought to do? Decorative design was to-day in the melting-pot, so to speak. There was a new spirit abroad which, as decorators, they needed to study and value aright if they were to hold their place in the estimation of the public. The rapid strides made in recent years in the art world materially affected them, and should be most welcome to one and all. In conclusion, he trusted their meetings and deliberations would be helpful, for their object had been to stimulate and inspire them to future effort.

Mr. T. Preston said the reason why their Association had been so successful was because everybody who had been connected with it had been up and doing. When they started their Association they set out with three objects in view. They desired to receive recognition from the craft with which they were connected; they desired to receive recognition from the public; and, lastly, they desired recognition from public men. These objects were being attained; they had good ground for gratification for the recognition they were receiving from public men.

At the afternoon's meeting the secretary's report was passed, and stated that the year had been marked by the greatest activity in all departments of the Association's work. An international studentship scheme had been considered, and had now taken shape sufficiently to be issued to the boys, apprentices and sons of members of the three associations in London.

The convention was resumed on the following day at the Temperance Hall, under the presidency of Mr. Jno. W. Barker.

The Teaching of Apprentices.

Mr. H. Looke, of Hull, read a paper on "What to Teach an Apprentice." After alluding to the local efforts which were being made in connection with technical schools, he said there was outside those efforts undoubtedly great scope for their Association in connection with the training of their apprentices. One of the avowed objects of the National Association was the raising of the status of the painting trade and the personnel engaged in it. What means would be the most effective? It had lately been the fashion to expect mighty things from combination, and it must be admitted that some commercial benefits had resulted therefrom. But combination was not everything; it was upon the training of the young that their efforts should first be directed. Plain painting would never raise them to the high level which it was their aim to reach. It was upon the decorative and artistic side that they would place their craft upon a better platform. If they as a handicraft were content with their present position, well and good; but if they aspired to a semi-professional status it was time for them to do something which would enable them to justify their aspirations. It had been a favourite pastime to declaim about the nobility of their calling, but as a matter of fact the decorative painting trade was now in a state of mental bankruptcy. The art of painting and decorating as practised in this country to-day was in no sense fine, or even art. It could only be placed in the same category as tailoring, cabinet-making, or any other domestic art. It was even debatable whether it was on a level with those modest occupations, for was not almost every embellishment provided for them, and were they not merely agents of the manufacturers? Their paints were mixed for them by the manufacturer, who, in fact, was killing them by kindness, and that being so were they not merely the tools to do their bidding? To the older men this did not much matter, because the knowledge they had gained could never be taken away from them; but how were their boys to learn the secrets of the craft, whilst the manufacturers held the ascendancy? For the making of a clever master-painter, five factors or qualifications were required—skill, knowledge, taste, tact and energy. They wanted skill coupled with knowledge, applied with taste, and managed with tact and energy. Here they had the Alpha and Omega of the qualified craftsman. Skill was of foremost importance. The art of drawing was the pivot upon which all their efforts for betterment must, in the first instance, turn. Trades' combination would not do it, commercial protection would not do it, but the practice of

drawing would. He said it deliberately that not only should their boys, but every child ought to learn to draw, for the cultured and educated eye had means of enjoyment all its own. It not only looked at things, but it saw them. Of the second qualification, knowledge, chemical and technical knowledge claimed precedence. Without that the man was but an inferior workman, and the master less than half of what he ought to be. The chemistry of colours might be said not to exist so far as the rank-and-file of their workmen were concerned, and yet considering that bread and butter depended upon it, it should be at the finger-ends of everyone in the trade. The second kind of knowledge that claimed attention was architectural knowledge, without which no painter could attain to a true understanding of his work. Coming to the third qualification, taste, he said that taste chiefly, as far as they were concerned, consisted in self-repression. Diversity of taste he held as the greatest blessing imaginable, and every decorator should make the most of it. Taste, as far as they were dominated by its teachings, consisted of the rightful and proper application of those principles to which the study of architecture and kindred arts formed the natural introduction. The qualifications he had named were not so often found in combination as the exigencies of their calling required, but the materials from which to develop them were as plentiful in this country as in any other. They were called upon to lay to heart the lesson that the education of their rank-and-file had not kept pace with that of the manufacturing community or the public generally. In conclusion, Mr. Looke urged that artistic education ought to be the motto of their Association and its watchword for years to come.

Mr. Harris (Plymouth), in moving a vote of thanks to Mr. Looke, rather demurred to his sweeping statement regarding their subservience to manufacturers. He was quite at one with him in regard to the value of original work, but he was quite convinced that the majority of master painters of England and Wales were not restricted so much by their want of ability in this direction as by the financial difficulty under which England was living at the present time. He (the speaker) believed that the travelling scholarship attached to the Association was doing excellent work. He thought that in following the lines which South Kensington had laid down of giving opportunities to a few of their best students of going abroad, a large number of lads were working for this coveted scholarship, and they were being educated and raised, although they failed to attain the mark for which they were striving.

Mr. Sibthorpe (Dublin) seconded the resolution, and feared that Mr. Looke had raised the standard so very high that generations must elapse before their trade could hope to attain to anything like the realisation of it.

Mr. Thompson (Belfast) supported the resolution, and it was agreed to.

Mr. Looke, responding, said no doubt it would take years to educate the younger members of their trade in the method he had indicated, but it would not take years to give them some sort of sensible understanding in the matter. The rough-and-ready gist of what he had had to say was this—was manufacturing domination going for ever to rule this country, or was handwork to become a more important feature of their handicraft?

Thoughts on House Decoration.

Mr. Walter Crane, the eminent artist and art critic, then read a very able and interesting paper under the title of "Some Thoughts on House Decoration." In the course of it he remarked that house decoration would seem to be almost synonymous with civilisation, and certainly had been coextensive with its development in the world. The domestic interior, so far as they were able to realise it, and all that it implied, afforded the best visible evidence both of the standard of living and refinement and sense of beauty existing among a race of people of any age or country. In proportion as the conditions of human life became more and more artificial and removed from nature, man seemed to require the aid of art. Decoration, indeed, might be regarded as a sort of æsthetic compensation for the increased artificiality, complexity and restraint of civilised life. Every race and every age, acted upon by all sorts of influences, climatic, social, economic, commercial, political, historic, evolved its own ideas of home and comfort, and these in the long run were the fittest to the circumstances and conditions, but by no means always the best. But the forces which fashioned their lives and characters, which determined their habits and pursuits, also determined the character of their surroundings. The very ideas of home and comfort which one might consider more fixed and permanent, seemed, with the increased complexity of modern life, especially on the lines of the present development of large cities or commercial centres, liable to change. The practice of living in flats and residential hotels must surely tend to displace or modify, in the mind of the ordinary citizen, older ideas of what constituted the completeness and organic relation proper to an independently-constructed dwelling. The contraction of space, and

sometimes of light, commonly associated with flats, could not have a favourable physical effect, and the impossibility of any garden setting—beyond a window-box—must affect the general health, as well as a healthy sense of decoration. The decorative designer certainly depended largely for freshness of inspiration and suggestion in design and colour upon growing plants and flowers, upon the sight of birds and animals, of the ever-changing sea and sky, and the colours of the landscape. Having provided small brick boxes, with slate lids, as houses for the people, and packed them together in straight rows, all alike, on the eligible building land of their towns, they proceeded to economise space (and secure more unearned increment to the square foot), by packing such boxes one on the top of the other and calling them mansions or residential flats. On the other hand, the collective dwelling of which they saw the germs in the better type of modern flats, with a common kitchen and dining-hall, might have an important future, and there was no reason why, given favourable conditions, dwellings on the plan of collective living or collective homes should not have dignity and beauty, as well as the comforts of a home. From the decorator's point of view, the plan and scale of such collective dwellings might afford fine scope for art; a large public room, such as the hall and the common dining-room, might be simple and dignified with panelled walls, leaving a space above for a continuous frieze of figures, or divided into separate subjects, illustrating local history or legend, poetry, romance, or symbolism of life and nature. The true place, however, for the decorative perpetuation of local history and legend was the town hall, and it was satisfactory to know that this principle had been thoroughly recognised in at least one important city of England, and in a modern town hall—he alluded to the frescoes of Ford Madox Brown, which vividly and dramatically illustrated the history of Manchester and her worthies, and appropriately decorated the walls of the city hall. In Birmingham, also, he believed, a scheme of painted panels had been devised to illustrate local history, and students of the municipal school of art had competed for the design of these. This seemed an excellent idea, which might be generally adopted. Every town which had municipal buildings and a municipal school of art might do much, not only to stimulate public spirit and local feeling, but also materially help young students and designers, by giving them an opportunity of doing public work, and thus getting practice with the highest kind of decorative art—mural painting. Surely, if they had any pride of place, if they regarded their

towns and cities as something more than mere mills for money-making, they must feel how greatly the interest and beauty of those towns and cities might be added to in such ways as these, as well as public parks and gardens, fountains, trees along the streets and seats and shelters. He certainly congratulated Leicester upon the recognition of the importance of increasing the beauty of their streets—at any rate, in the residential portion of the town—by trees, parks and open spaces for her people. Indeed, having regard to the future of the race, and the importance of space and open air, and surroundings of some beauty, to the health of the people, and especially of children, it became a public question of pressing importance this of the condition of life in their cities. One remarkable demonstration or object-lesson had been given, thanks to the initiative, energy and philanthropy of Mr. George Cadbury, at Bournville. He had proved, at least, that factory work might be carried on amid pleasant surroundings and means of recreation for body and mind, and that a working population could be housed in close proximity to their work in picturesque and cheap healthy dwellings surrounded with ample gardens. The Garden City Association was also in the field with Mr. Ebenezer Howard's scheme for uniting agriculture, horticulture and manufactures, with beautiful and healthy dwellings in garden cities, which would, it was hoped, relieve the overcrowding of their great towns. Now, he took it, a painter or a decorator must be primarily concerned with producing something of beauty. Let his problem be of the simplest. A good sense of colour was of the first importance. A knowledge of how to produce certain tints, the effect of one tint upon or in juxtaposition with another, the best grounds for different tints—all these things, in addition to the workman's skill of hand in laying on paint evenly, were essential parts of a painter's and decorator's training and equipment. There was nothing like paint after all. In fact, whether inside or outside, the town house required constant cheering up by the painter and decorator, but it must be the decoration that cheered and not inebriated. Dear to some decorators' hearts was graining. Wonderful and sometimes fearful were its results. Nothing to his mind could be more sordid and unpleasant than the woodwork of a room grained to imitate oak. There was nothing like white paint for the woodwork of modern rooms. The mouldings would give the necessary relief. If their technical schools where house-painting was taught, instead of devoting time and skill to teaching methods of imitative graining, were to endeavour to train the pupils to

use the brush as decorators, and encourage them to design and paint simple or ornamental borders, fillings and friezes, such as might be useful in interior decoration, and train them to be able to space out walls with simple but tasteful sprays of leaves and flowers, decoratively treated, and painted by direct, clean brush touches, they would be doing much more excellent as well as interesting work, work which in its practical results ought to prove more pleasant and useful both to house-painters and to householders. In deciding on a scheme for the decoration of one's house, one must consider what should be the chief decorative points, and endeavour to lead up to them. As a rule, in modern drawing-rooms and living-rooms there were too many colours, as well as too much furniture. There was, no doubt, a determined effort in the direction of a return to simplicity both in house designing, furniture and decoration on the part of the more refined and cultured, as a reaction perhaps against the ostentation and luxury of the appointments of the extremely or newly rich, or the pretentiousness of the decorations of monster hotels, whose coarse imitations of decadent periods of French art did duty for splendour. How charming a cottage could be made, how picturesque and pleasing, though quite new, how perfectly in keeping with its surroundings and fitted to its site, he lately had an opportunity of seeing in the neighbourhood of Leicester, designed by Mr. Ernest Gimson. Relationship was, of course, the essential in all decoration, otherwise it became a patchwork of complicated pattern and colour. It mattered not what their materials might be, or by what means, costly or simple, they sought to obtain their effect, all must be in keeping with the right place and suitable to the conditions and surroundings: rich and splendid if the aim were to be rich and splendid; simple and quiet if the aim were to be simple and quiet; but without the pretence of richness or obtrusive display on the one hand, or the sometimes extreme rudeness, boldness and roughness which accompanied what looked like the affectation of simplicity on the other.

A very hearty vote of thanks was subsequently passed to Mr. Crane for his valuable paper.

At the afternoon session Mr. Fletcher, headmaster of the School of Art, read a paper on "The Value of Design and Reticence in Decoration," in the course of which he said there was no one in all the building trades with more power for making or marring a building than the decorator; his position was unique. It was his taste mainly which decided the treatment; the client, more often than not, being uncertain as to his

own taste referred the matter to the decorator, whose business it was to beautify. There were cases, of course, where the client in the matter of wall-papers would have the latest thing—the last and most blatant pattern had come upon the market, and to this fashion even the arguments of good taste were of no avail. The fashionable thing, however, was rarely the most refined. Could not manufacturers keep from year to year the finest things, and have a separate garish lot for the fashionable person? It was in vain that they asked for a good pattern which was a year old. The value of design did not necessarily mean the value of ornament. Primarily, he hoped that this paper might lead them again to suggest to their clients the value of reticence, to enhance the effect of that ornament which was fit and fine. It was still difficult to surpass the restful dignity of rooms which were decorated before wall-papers were invented. A knowledge of design, as an education in taste, was of great value. This knowledge led to the value of pattern as a whole, and with it it was possible to transform a poorly-proportioned apartment into one of seemly shape, or by an emphasis of one part or another to draw attention from an ugly construction. Where additions or alterations had been made to a building destroying its unity and breadth, the painter's sense of design might pull the whole together, and unite parts which were isolated. With reference to mouldings the same might be said. If the section of a moulding was properly designed it gave its own decoration by its light and shade. The effect of many a simple and dignified house or block of buildings was often completely ruined by picking out the various parts in different colours, when a reticent and broad treatment was best. When style was only unconsciously recognised the different building trades were not divorced from each other; each craft worked with the same aim in view, or their aim changed so slowly that the work of succeeding workmen was not incongruous. Nowadays buildings were raised in a confusion of different styles, and if their decoration was not in keeping with them confusion became chaos. Just as mouldings might suggest the treatment, so also might the plan. The pictures and furniture might also suggest the scheme of the decoration. The value of simple elements in design was apt to be overlooked. At the present time the most successful work was based on the simplest lines and elements, the variation of one or two units being often the basis of an entirely satisfying and beautiful effect. By reason of the simplicity of the means employed, the work had an additional source of interest. Bound up with the question of simplicity of detail in

the form and scheme of patterning was also the question of colour. The one suggested the other. In the decoration of rooms and halls of assembly the colour and the character of the design were mainly decided by the fact that the walls (which formed the main part of the surface to be treated) were to be a background for pictures or people, and just as for a background for good pictures they should not choose a strong and restless pattern, so, as a background for people, they avoided that which, like incandescent gas, showed them to disadvantage. Considering people and pictures, and the diversity of parti-coloured objects behind which the decoration had to stand, they would agree, he thought, that it was safest and best to keep both colour and pattern on simple lines. By the emphasis of these two points, design and reticence, it was not meant to imply that there was no place with which gorgeous colour and elaborate pattern might be employed with fitness. But when it was employed it was of the first importance that it should be of the best—such work as Ghiberti or Morris might have done. It was a mistake to allow anyone but a master to handle elaborate pattern. What he had mainly sought to bring before them was the importance of a reticent use of ornament—the value of simpler and better design, the broader treatment of painted surfaces, less picking out and, if possible, more original work fitted to the constantly differing requirements. It was in this, a better direction, that taste was trending, and they should be more than ready to lead it. In conclusion, he ventured to remind them of the dignity of their calling. If the decorator's position was unique (on the principle, *finis coronat opus*), his responsibilities were proportionately wide and deep. It was his part to crown and consummate the work of those who had laboured before him. Not his employer alone, but all around were his clients; out of doors his fellow-townsmen were daily under the influence and it should be the inspiration of his work, and within the house the result of his taste should be the ally of rest and refreshment and of all the virtues which went to make it home.

A vote of thanks to Mr. Fletcher for his paper was carried unanimously.

The following officers were elected for the ensuing year:—President, Mr. Graham Cole (Newcastle); vice-presidents, Mr. J. W. Ballamy (Birmingham), Mr. Jas. Riley (Nottingham), Mr. William Simpson (Hull), Mr. Geo. Tawse (Sunderland). The treasurer and secretary were re-elected.

A vote of thanks was passed to the retiring President and officers for their services during the past year, and a cheque of

THE DRAINING OF THE ZUYDER ZEE.

A FOREIGN OFFICE report on the draining of the Zuyder Zee (No. 565, Miscellaneous Series) has been issued. It is prefaced by a letter to the Marquis of Lansdowne from Sir H. Howard, British Minister at The Hague, in which he says:—I have the honour to report that a Bill on the subject of the draining of the Zuyder Zee was recently introduced in the Second Chamber of the States-General by Mr. Lely, the Minister for the Waterstaat, who likewise furnished the Chamber with a memorandum in explanation of the measure, giving a historical retrospect of all former proposals of this nature, as also the most complete details concerning his own proposal. . . . Mr. Lely's memorandum on his scheme is, in my opinion, of such historical, technical and general interest, that I have deemed it my duty to transmit herewith to your lordship copies of the Bill and memorandum, together with translations of the same. The scheme in all its details is so well described by Mr. Lely that it is only necessary for me to point out its main features. The plan really consists of first enclosing and afterwards gradually partially reclaiming the Zuyder Zee, the pumping out of the water to be effected by steam pumps. The first work will be the construction of a dam from Wieringen, in North Holland, to Piaam, in Friesland. This dam will have sluices into the North Sea. The next works will be the creation of two polders, or areas of dry land reclaimed from the Zuyder Zee; the first, between Wieringen and Medemblik, to be called the "North-west," or "Wieringen Polder," and the second, between Hoorn and Marken, to be called the "South-west," or "Hoorn Polder." The rest will remain a fresh-water lake, at all events in so far as Mr. Lely's plan is concerned, but should the latter prove successful his ministerial successors may in days to come create two more polders on the north-east and south-east of the lake. The two polders will be of the following area, viz. the Wieringen Polder, 21,700 hectares, containing 18,700 hectares of fertile land, and the Hoorn Polder, 31,520 hectares, containing 27,820 hectares of fertile land. The entire work is to be completed in eighteen years. The enclosing dyke from Wieringen to Piaam will be finished in the ninth year. In the eighth year will be commenced the works for dyking the

Wieringen Polder, which in the fourteenth year will be dry and ready for sale. In the eleventh year the similar works on the Hoorn Polder will be begun, and will be completed in the eighteenth year, when an area of upwards of 46,500 hectares of fertile soil will have been reclaimed. The cost of this gigantic work is estimated in round numbers at 95,000,000 fl. (7,916,667*l.*), which amount is to be raised by loans, and it is proposed to pay off the principal and interest by an annual increase of the Budget of 2,000,000 fl. (166,667*l.*) during a maximum period of sixty years.

The remainder of the report consists of a translation of the Bill and a transcript of Mr. Lely's explanatory memorandum.

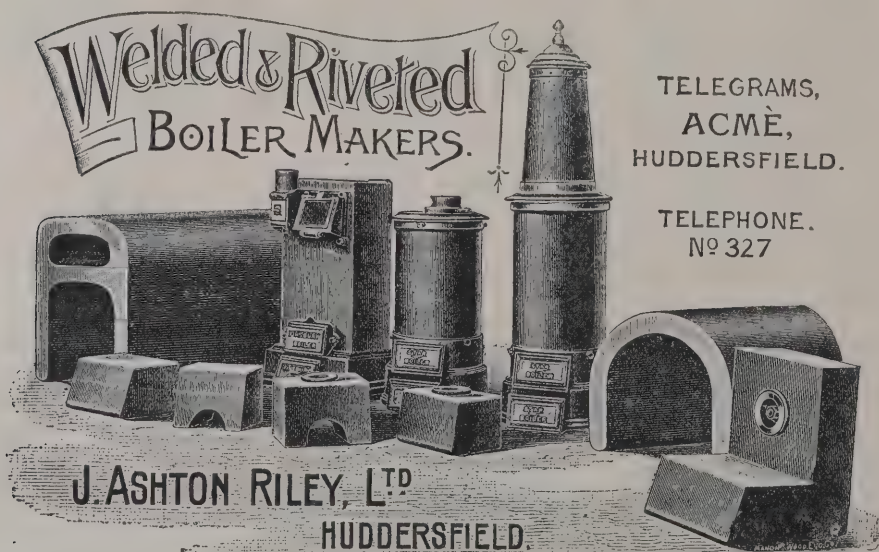

THE BOROUGH IMPROVEMENT SCHEME.

Six years ago the late Vestry of St. George the Martyr suggested to the London County Council the expediency of widening Long Lane and improving the approach to Tabard Street from the Borough High Street by constructing a road through a portion of the churchyard. The Council having thoroughly considered the matter from all standpoints, decided in June 1896 to apply to Parliament for powers to effect the improvement, the estimated gross cost of which was 207,400*l.* and the net cost 190,000*l.* The proposed alterations comprised the widening of Long Lane between Southall Place and Borough High Street to 50 feet, whereas originally it varied from 23 feet to 40 feet. The scheme necessitating the inclusion of a portion of the churchyard, it was agreed to give an equivalent in land hard by.

Parliament having given a ready assent to the scheme, the Council began to acquire the property towards the end of 1897, and it has continued to enlarge its holding ever since, with the result that a considerable portion of Long Lane now belongs to them. To one owner of property in the street, viz. Mr. A. J. Denman, beer-can manufacturer, 8,000*l.* compensation was awarded in the spring of the present year, and there have been several other heavy claims to meet. The work of demolition is now in progress. Here, as elsewhere, the County Council will pursue its usual practice. When the land has been cleared that not required for the new street will be let on lease.

A scheme has been prepared for rehousing persons of the labouring classes displaced by the carrying-out of the improvement on a site in Le Roy Street, but by the Act the Council

cannot displace persons of the working classes till the scheme for rehousing has been approved by the Home Office. With regard to the Long Lane improvement, we understand, says the *Daily News*, that any remains which may be found in the churchyard of St. George's will, under the provisions of the Act, be transferred to Brookwood, where they will be reinterred at the cost of the County Council. Close at hand to the old church is the site of Marshalsea Prison, whereon now stands a large printing and manufacturing stationers' business. It was in this gaol that Charles Dickens's father was imprisoned for debt, and the place is intimately associated with the story of "Little Dorrit" and her family. It was in the vestry of St. George's Church that Little Dorrit found refuge, and was accommodated by the kindly old sexton with a bed formed of pew-cushions, with the book of registers as a pillow. It was in St. George's Church, too, that she subsequently married Arthur Clennam. The Borough, where the County Council are now engaged in carrying out important improvements, is in a variety of ways associated with the distinguished novelist who was the first to occupy the editorial chair of the *Daily News*.

ELECTRIC LIGHTING AT WALTHAMSTOW.

WALTHAMSTOW presented quite a gala air on the occasion of the recent inauguration of the electric light, the installation of which necessitated the application to the Local Government Board for a loan of 41,000*l*. The new station, covering some 2 acres of ground situate in Essex Road, Hoe Street, is already capable of lighting the principal streets, where there are sixty-three arc lamps each of about 1,400 candle-power, and applications have been made by inhabitants for current for no less than 15,000 eight candle-power lamps. Already 54 miles of cables have been laid in the streets. Many new arrangements have been introduced by the electric-lighting committee. For instance, attached to the arc lamp columns are two sixteen candle-power lamps, which will be lighted after 11 P.M., when the arc lights are turned off. A system of "free wiring" has also been introduced, by which means householders can have their premises wired at once without any immediate heavy cost to themselves. The charge for current is fixed at 5*d*., 4½*d*. and 4*d*. per unit, according to the amount consumed. People availing themselves of the "free-wiring" system will, over a certain period, pay an extra

½*d*. per unit to meet the cost of laying the wires. Electricity for motive power can be obtained at 2½*d*. per unit, and motors for industrial purposes or lifts will be provided by the Council upon a carefully-considered instalment system.

The plant is substantial, and consists of two gas generators, three gas-engines of the three-crank type, each of about 100 horse-power, with dynamos coupled direct. The dynamos are here worked by gas-engines, and the gas is generated on the Dowson principle—that is, by injecting steam over red-hot coals in a furnace. The cost of this method works out to about 2*d*. per 1,000 feet, while coal-gas costs 3*s*. 10*d*. per 1,000, and about 4,000 feet of the former do the work of 1,000 feet of the latter, thus saving 3*s*. 2*d*. The main building, erected by workmen directly employed by the Council, is 123 feet long and 79 feet wide, and comprises the engine and battery-rooms, with stores and offices overhead.

Ample provision has been made for increasing the plant whenever the demand for more light is made. In fact, two more gas-engines, each of 250 electrical horse-power, and two dynamos are under order. The District Council having in view the development of this charming locality, are projecting further means of inter-communication—either electric trams or a light railway—and the current will be supplied from this station.

COST OF ELECTRIC LIGHTING.

AT the inauguration of the Longton Corporation electric-light works Alderman Baker, chairman of the gas and electricity committees, said there was a general consensus of opinion in the country that there should not be large profits made either from electricity or gas. In their case this was very important, because they had placed both undertakings under one authority, and for many reasons they thought they had done so wisely, but in order to be quite unbiassed and ready to supply either light indifferently, it was almost necessary they should supply both at cost price. He thought he should be able to show them that under some circumstances, perhaps many, electricity would be the cheaper illuminant, and he had a strong opinion that in very many cases a combination would be very beneficial both to the consumer and themselves. He was afraid that the system of charging they had adopted had so far had a deterrent effect on the adoption of the electric light. It was, no doubt, very difficult to understand, and there was, unless the consumer understood how to take care of

himself, an element of uncertainty which was at least trying, and yet nothing was so certain as the fact that a sliding scale must be adopted, or the undertaking would be a failure. A flat price would be unfair to the profitable consumer, for there were consumers to supply whom would spell ruin, and the profitable consumer's price would have to be raised to cover the loss on the unprofitable one. That was universally acknowledged to be inseparable from electric lighting, and although it was not claimed that the system they had adopted was absolutely perfect, it was acknowledged to be nearer perfection than any other at present devised. He had often been asked whether he could not give some simple formula as to cost which people could carry away with them. He had hesitated about doing so until he had more opportunities of discussing the point with those having the system actually under their management, but he thought he might now attempt something of the sort. He would make the comparison of an ordinary gas-burner at 3s. 1d. per thousand cubic feet with a standard 8 candle-power electric lamp at 8d. per unit maximum and 2d. per unit minimum, as adopted by them. The cost of a 16 candle-power lamp would be twice that of an 8 candle-power lamp and a 32 candle-power four times, and so on in proportion for the other sized lamps. Now an ordinary gas-burner, if burnt for 365 hours, that was an average of one hour per day, would cost 6s. 8d. per annum. An electric lamp used for the same time would cost 7s. 6d. A gas-burner burnt for 730 hours, that was an average of two hours per day, would cost twice 6s. 8d., namely, 13s. 4d., but an electric lamp used the same time would only cost 9s. 6d. Again, a gas-burner burnt 1,095 hours, or an average of three hours, would cost three times 6s. 8d., or 1l. An electric lamp used the same hours only 11s. 6d. Again, a gas-burner burnt 1,460 hours, or four hours per day, would cost four times 6s. 8d., or 1l. 6s. 8d. An electric lamp for the same time 13s. 6d. So they would see that while the cost of an electric lamp for one hour per day was more than the cost of gas, with an average of two hours per day or more the reverse was the case, and while the cost of gas increased at the rate of double the initial cost for each additional hour, the electric lamp for each additional hour only added 2s. to the initial cost. This was a most important factor, and in the case of a long consumption the balance in favour of the electric lamp was very marked. He was afraid, however, that he might mislead them with the above comparison so far as light for light was concerned, as it took a 10 candle-power lamp to equal the light

of an ordinary gas-burner, and the prices therefore would stand at 9s. 6d. for a one-hour consumer, 11s. 6d. for two hours, 13s. 6d. for three hours, and 15s. 6d. for four. Still much in favour of electricity for two or more hours' consumption. But he must not disguise the fact that in electricity there were some pitfalls which did not exist in gas. As in the case of gas, several lamps might be used to burn a total of 365 hours or 730 as the case might be, but they must burn sequentially, none of them simultaneously (as might be done in gas), or it would not secure the cost of 9s. 6d. for 30 hours, with an addition of 2s. only for each additional hour. If a second lamp was lighted the first must be put out. The second lamp must be in substitution of the first, not in addition to it. The limit of time allowable for the simultaneous lighting of two or more lamps without being recorded was 10 minutes. To study economy the great point was not so much to turn the light out on every possible occasion as to take care that such a number of lamps only were in use as might be required regularly day by day. It was advisable to light one room one evening and another the next evening, and if there were, say, five lamps in each room they would still count as five lamps, but if the two rooms were even occasionally lighted up simultaneously they would count as 10 lamps, and the average hour's consumption of each lamp would thereby be decreased. Now five 8 candle-power lamps, with an average consumption of two hours each, would cost five times 9s. 6d., or 47s. 6d. a year, while ten lamps with an average consumption of one hour (making together the same total number of hours) would cost ten times 7s. 6d., or 75s. This was the great point where the householder especially could take care of himself to so great an extent and help them, for their engines were of only limited capacity, and electricity was not storable like gas, but must be practically supplied direct from the engines, so that while they might not be able to meet a large simultaneous demand upon them, they would gladly welcome that same demand spread over a longer time. If they could (like gas in the gasholder) store electricity they could work the engines constantly during the twenty-four hours and supply nearly ten times as much with the same engines and dynamos as they could now, and so decrease the cost of capital charges per unit to one-tenth of what it now was, and if this difficulty as to storage was ever practically and economically solved, they might depend upon it that gas would have no chance against electricity for lighting purposes. It was true there was one way it could be solved even now, that was by obtaining consumers who would take

electricity in the daytime, and not require it when the demand for lighting in the evening came on—a day-load, as it was called. This, however, was rarely obtainable to the full extent of the capacity of the plant, and the station that could get such a load was very fortunate and its success assured. A good help in this way would be motors for use in the manufacturing. The motors were much less liable than gas-engines to get out of order or to give trouble, and occupied much less space and were more portable. The success of the undertaking would depend upon the support they received. They were told by other electric authorities that so far they had done very well and made a good start in the numbers of their consumers. These would alone go a long way in keeping their present engine fully occupied. He felt very confident himself that there were plenty of consumers in Longton who could with advantage to themselves use the electric light, and it would be their endeavour to secure such consumers, and not those to whom it would be a disadvantage. They would rather start slowly and give satisfaction than secure those who might afterwards blame them for not having advised them well and truly.

BUILDING IN GLASGOW.

AT the opening of the Glasgow Dean of Guild Court, Dr. Robt. Gourlay made the customary annual statement. He said:—

Before we take up the ordinary business of the Court I wish, very shortly, to glance at the work of the past year. The number of linings granted has been 498, and the valuations of these represent a sum of 1,559,294^l. These linings are made up of 105 houses and shops, 4 public buildings, 16 churches and schools, 113 warehouses, stores and workshops; 240 alterations and additions, and 20 new streets of 5,264 yards in all. Of the houses for which linings have been granted 377 are for those of one apartment, 1,124 of two apartments, 554 of three apartments, 123 of four apartments, 92 of five apartments and only 176 for those of six rooms and upwards. If we throw out the larger houses of six rooms and upwards we find that houses of two rooms are nearly equal in number to those of all the others, viz.—one, three, four and five rooms—put together. The linings for one-room houses, I am glad to see, have been steadily on the decrease during the last eight years, and this year compares most favourably with that of nearly thirty

years ago, when the linings for this class of house were nearly four times what they have been in the year just closed. The houses of one apartment are equal to about 20 per cent. of the whole for which linings have been granted, and the houses of one and two apartments are equal to about 50 per cent. of the whole for which linings have been granted. Some of you may remember, bearing on this, a striking statement made by the late John Bright in his rectorial address to the students of Glasgow nearly twenty years ago, in which he quoted figures to show that 41 per cent. of the houses in Glasgow were then of one apartment, and 37 per cent. beyond the 41 of two rooms, bringing out the fact that 78 per cent., or four-fifths, of the houses were of two rooms and under. And at that period nearly one-third of the whole people of Scotland dwelt in houses of one room, and more than two-thirds in houses of not more than two rooms. No wonder that John Bright, with his natural eloquence, said:—"I plead not for the great and for the rich, I plead for the millions who live in homes with only one room." We have made some progress since John Bright appealed for the dwellers of one room, and I trust the day is not far off when, in the interests of health and decency, the one-room house will be unknown in our midst. The value of the dwelling-houses and shops for which linings have been passed during the year is 678,574^l. These are spread over the different outlying districts of the city, but only in the districts of Queen's Park and Maryhill—with three exceptions—are there houses being built having six rooms and upwards. In the Eastern, in St. Rollox, and in the two districts already named there is abundant evidence that the city is growing rapidly, its many and varied industries, which have fortunately taken root with us, drawing many no doubt to this great and busy centre. It is also interesting and satisfactory to note that no one district has a monopoly of our public works. The old does not give place entirely to the new, and the East and St. Rollox hold their own against the western flow of the river Clyde. The past year, with linings of over a million and a half in value, is not a record year, but only seven times in the last thirty years has it been surpassed, and when we consider that ever since the extension of the city boundaries nearly ten years ago the valuation of the linings granted by the Dean of Guild Court has every year exceeded one million sterling, and in two of these years has been over two millions, and in other two close on these large figures, we can realise how important is the work given this Court to do, and how needful it is in the best interests of the city and of its vast population,

but specially its great working population, that the Acts we seek to administer should be interpreted with an earnest desire to do the best we can to make every dwelling-place over which we have jurisdiction attractive and wholesome to rich and poor alike. I desire to acknowledge the loyal, able and practical help I have had from my friends the sub-dean and the lymers of the Merchants and Trades' Houses, the wise and willing guidance in points of law from my learned assessor, Professor Moir, and Mr. Ramsay, and the ability and care shown by Mr. Nisbet in his notes on the plans brought before the Court. I, too, would wish to thank Mr. Neilson, the procurator-fiscal, for the courtesy and anxiety with which he has discharged his not always pleasant duties, and you, gentlemen, who from time to time have appeared here, for the respect and deference you have ever shown to the Court, and for your desire at all times to help and not hinder its work.

CANAL BURST IN BIRMINGHAM.

AT an early hour on Saturday Sept. 28, says the *Birmingham Post*, a serious and destructive canal burst occurred near the centre of Birmingham, causing widespread consternation, but fortunately resulting in no loss of life. An arm of the Birmingham and Wolverhampton Canal penetrates into Newhall Street and terminates at the Newhall Street wharf, forming a cul de sac. At that point Messrs. Jones, ironfounders, are erecting new premises, and excavations were being made with the view of strengthening the canal wall. Owing to these excavations, or to some defect in the canal basin, suddenly the wall collapsed, and the water rushed through the gap with tremendous force. The irresistible torrent carried away huge masses of masonry and heavy iron stanchions, and carving out a new channel for itself poured down Lionel Street several feet deep, and submerged the works of Messrs. Hope, ironfounders, and Messrs. Mitchell & Co, pen manufacturers. In a few moments the basement and lower portions of the pen factory were filled with water to a depth of 12 feet. Fortunately the offices and store-rooms were on a higher level and escaped the flood, or otherwise a large quantity of pens would have been destroyed.

Continuing its course the flood dashed down Newhall Street, flooding Messrs. Elington's works and the cellars of houses and factories on each side of that thoroughfare,

ultimately finding its way into Fleet Street, where there is another branch of the Birmingham and Wolverhampton Canal. On the banks of this arm is a house occupied by Samuel Brewer and his wife and six children. About half-past three o'clock Mr. and Mrs. Brewer were awakened by the sound of rushing waters, and looking through the window saw that the premises were surrounded by a deluge. The house was shaking on its foundations and its collapse seemed imminent, the yard and outhouses having already been carried bodily into the canal. With the assistance of the police, however, the family were extricated from their precarious position, and shortly afterwards the footpath sank nearly 2 feet, and the foundations of the house were undermined so that temporary supports had to be provided. The greatest damage was occasioned by the flood at this point, the road being torn up, the kerb-stones scattered, and the asphalted pavements ripped up for some distance. Another volume of water rushed into Ludgate Hill and Water Street, where the basement and ground floors of the Corporation electric-lighting works were inundated, the cable tunnels being flooded. At one of the public-houses in the neighbourhood the barrels of beer were swept away. Prompt action was immediately taken by the police and the canal officials to stop the flow of water, the lock being closed at Friday Bridge, and the canal dammed at the commencement of the branch. As a result of the accident work had to be suspended at several factories and workshops.

THE TRAMWAYS ACT, 1870.*

THE Act has now been thirty-one years in operation, and has never been amended. This view is not the result of opposition to municipal trading, nor based on any idea that municipal ownership of tramways is an economic mistake. 1. History and Effect of the Act.—The decision in *Reg. v. Train* (1862) rendered it necessary to obtain Parliamentary authority to lay down a tramway. The object of the Act was to facilitate tramways by substituting provisional order for Bill. It was, however, hedged round with restrictions. 2. The Vice of the Departmental Method of Legislation.—The essence of the departmental method is that the inspector who holds the local inquiry (if any) has no authority to decide. The Board of

Trade have failed to obtain any respect for decisions in really contested cases. In such cases the practice of promoters is now to go to Parliament direct. 3. The Want of Compulsory Powers for the Taking of Land—English roads are seldom suited for tramways without alterations, yet the Tramway Order may not authorise the taking of land for road widening. 4. The Frontagers' Veto—Frontagers in narrow places can prevent tramways by a mere mechanical veto. This has led to single lines and other bad tramways. 5. The Veto of the Local Authorities.—This veto has sometimes been abused, and has tended to discourage the best schemes and the soundest promoters. It is not, however, likely that an objection by a local authority based on reasonable grounds would ever be overruled. 6. The Purchase Clause.—There were some good reasons for inserting a purchase clause, though nothing of the sort had been applied to railways, and gas and water undertakings have only been purchased under special Acts at a very full price. It is now hopeless to contend that there should be no power of purchase; the really debatable matters are the period and the method of valuation. Mr. Shaw Lefevre anticipated that promoters would not mind the purchase clause, because there was no limitation of profits. What they did was to try to take their profit through inflating the capital, and clear out. Hence abortive schemes and disappointed investors. The comparison between the price at which railway and tramway capital can be raised is not less instructive than that between private and municipal credit for tramway purposes. The best class of investors have been discouraged by the Tramways Act, and the cost of capital for tramway enterprise has consequently been increased. The great discovery of the application of electricity to tramways came just when the purchase periods in England were running out. There was consequently a long delay in adopting the new invention, and though England ought, but for Parliament, to have led the world, as it did in railway construction, it has been kept behind other countries, and has suffered social, economic and industrial loss. There is no country which had so great a need for electric tramways as England. The corporations have been slow to try experiments owing to their careful trusteeship of the ratepayers' money. The method of valuation is more important than the period of purchase. If goodwill is not to be paid for, there is no adequate motive for developing a business. The corporations have actually lost on balance, for while Tramway Act price is less than enough for a good tramway, it is too much for a bad tramway. It pays the company

better, when the purchase period is approaching, to retain an obsolete equipment, which ought to be scrapped, so as to make the corporation buy it. Practically no tramways are now made by companies on Tramways Act terms without modification, but the retention of the Act on the statute book still does a great deal of injury to tramway enterprise.

NEW WORKHOUSE, NOTTINGHAM.

STEADY progress is being made in the final stage of the erection of the new Nottingham Workhouse at Bagthorpe, and the various blocks of buildings have now, says the *Nottingham Guardian*, sufficiently approached completion to enable the visitor to form a fairly accurate idea of the appearance which the establishment will possess when the time comes for its opening. The inclusion of so extensive a range of buildings—covering close upon 70 acres of land—under the generic title of "workhouse" scarcely conveys to the mind of anyone who has not visited the site an adequate conception of the extensive dimensions of the establishment which is being constructed by Mr. F. Evans to the order of the Nottingham Board of Guardians and in accordance with the plans of Mr. Arthur Marshall, under the supervision of Mr. Foxworthy (clerk of the works). The operations of the builders are now being most actively pushed forward in the nine large blocks, ranging east to west on the south side of the site, which constitute the workhouse proper. Of these blocks, the five to the west of the administrative building in the centre are for the accommodation of male inmates, the four to the east being for females. Between each there is an airing-court wherein the inmates will take outdoor exercise, and communication between the blocks is provided by means of a central corridor 900 feet in length. The corridor is roofed between the buildings, but is open at the sides save for an iron palisading, and by means of subcorridors it gives access indoors to all parts of the establishment which it traverses. The workhouse blocks are each three storeys high, and the roofing of them all is now complete with one exception. The frontage on the south side of the administrative block is surmounted by a central tower 66 feet high, which is used as a water tower. To the left of the main entrance are the offices and committee-rooms, and to the right a suite of rooms for the matron is provided. The primary feature of this building is the dining-hall, a roomy apartment with a handsome open-timbered roof of

pitch-pine. Herein 500 persons can be seated at table, and a movable partition will separate the male from the female inmates at meal times. From the dining-hall corridors lead to the kitchen, sculleries and stores. The kitchen is very spacious, the light from the windows being supplemented by a lantern roof. Throughout the culinary department the walls are lined with white-glazed bricks, a dado of similar material, with border courses of brown, ornamenting all the corridors. A feature of the kitchen is that the sculleries, stores and other offices connected therewith can all be reached under cover. The main stores are on the north side of the administrative block, and the accommodation for this department is spacious and excellently ventilated. This is an observation, however, which applies equally well to every part of the establishment, particular care having been taken in the preparation of the plans to make the building as light and airy as possible. Before passing from the description of the workhouse blocks it should be mentioned that each building is provided with an "escape" staircase at each end in case of fire or other emergency. Between the workhouse and the infirmary buildings, which range in parallel lines, are the workshops, stables and other premises included in the labour-master's department. The laundry is of up-to-date construction, with extensive steam-drying accommodation, the disposition of the rooms in this building being so made that the clothes are received from the collectors at one end of the premises and sent out when finished at the other. The bakery is hard by, and at the present time workmen are engaged in fitting up the two large patent ovens which will bake all the bread required for consumption in the establishment. The boiler-house is the centre whence radiate the heating and electric-lighting mains throughout the whole range of buildings, the circulating pipes being conducted through a series of subterranean corridors through which one can walk to any part of the premises. There are four large Lancashire boilers, space being provided for two more should the necessity arise, and there is ample room for coal storage. In the basement of the boiler-house an elaborate system of heating and hot-water service-pipes has been installed. The chimney-shaft of the boiler-house, which is 100 feet high, has also been completed.

The infirmary buildings are in a much more forward state than the other portions of the establishment. This range is similar in its general disposition to the other main series of buildings with which it runs parallel. A central corridor, 800 feet in length, provides intercommunication between the

eight blocks which it passes through transversely, as in the case of the workhouse buildings. The main corridor of the infirmary differs, however, from the other in being closed at the sides, and in having an overhead way between the upper storeys. The infirmary is divided into eight blocks, each of which is subdivided into two pavilions, with frontages north and south, the total hospital accommodation, including that for imbeciles, being for over 500 patients. Glass-roofed verandahs are placed on the frontages facing south, day-rooms being provided instead in the pavilions with a northern aspect. In the main wards the heat of the radiators is supplemented by stoves, which conduce also to greater cheerfulness in the appearance of these rooms. The usual offices are placed at the extreme ends of the wards, from which they are separated by short corridors. In all the infirmary corridors the windows are so arranged that a pure air current can be obtained right through them whenever desired. Between the main wards in the respective pavilions of each block are small two-bed wards, ward kitchens, linen rooms, fuel stores and lifts. There is also an "escape" staircase at the south-west and north-west corner of each pavilion. Fireproof flooring of maple wood blocks upon concrete is being laid throughout the infirmary, a great part of this work being already finished. In the administrative block of the infirmary suites of rooms are provided for the medical officer in charge, the assistant medical officer, stewards, superintendent nurse and staff, together with committee-rooms. The kitchens and kindred offices are similar in plan to those in the workhouse. The dispensary is also included in this block, the serving counter being accessible from the main corridor. To the extreme east and west of the general infirmary buildings blocks of one storey have been built for the reception of cases not suitable for admission to the ordinary wards, and on the north-west corner of the site is situate the isolation ward with accommodation for the attendant nurses. The children's infirmary is to the north-east, and comprises four wards, with central office. The nurses' home, which provides comfortable accommodation for a nursing staff of fifty, is the northernmost building in the establishment, and has a southern frontage. The imbecile wards, on the rising ground to the extreme east, constitute a practically self-contained asylum, with provision for 250 patients. This department has its own dining-hall and administrative building, together with a set of workshops. The chapel is being built upon a knoll on the west side of the ground, whence a capital view can be obtained of the whole, of

the establishment, as well as of the surrounding country. When completed this edifice will present a very pleasing appearance. The structure is based on Bulwell stone, the remainder of the building being carried up with red Babbington bricks, faced with stone. The interior is built in Sileby sand-stock bricks, and the south corner of the frontage which faces west will be surmounted by a square turret. Just inside the entrance from Hucknall Road are the porter's lodge and vagrants' wards. The latter are being arranged upon the cell system, and the workmen are hurrying to bring them as speedily as possible to completion. There are still many months of work before the contractors, and after the place is out of the hands of the builders the laying-out of the grounds will occupy a considerable time.

THE "GARDEN CITY" SCHEME.

THERE could surely be no more fitting place in which to discuss the merits of such a scheme as that of the Garden City Association than the village of Bournville. It is there, says the *Birmingham Post*, that Mr. George Cadbury has so successfully carried out a splendid experiment in the housing of the workers, on lines almost identical with those which the enthusiastic followers of Mr. Howard desire to follow. The hundreds of delegates who opened their conference in Birmingham on Sept. 20, and who resumed it on Sept. 21 at Bournville, must have gained inspiration and encouragement from such surroundings. They spent the morning in a delightful ramble around the pretty village, gathering knowledge as they went as to the system upon which the undertaking is conducted, and admiring the provisions which are made for the recreation and education of the inhabitants. Shortly after noon they gathered in the spacious dining-hall which is set apart for the clerks employed in the great cocoa factory of Cadbury Brothers, and here they were entertained to luncheon by Mr. George Cadbury.

The following letter written on August 31 on behalf of the Right Hon. A. J. Balfour served to show that the leader of the Unionist party in the House of Commons is in hearty sympathy with the objects which the Association desires to achieve:—

"Mr. Balfour desires me to express his regret that he will not be able to be present at the conference to be held at Bournville next month by the Garden City Association. Without expressing any opinion as to the details of the scheme put

forward by the Association, or as to the degree to which it may be expected to provide a solution of the housing problem, Mr. Balfour desires to express his agreement with those who think that much is gained by the emigration of industries from overcrowded centres to rural or comparatively rural districts."

The first business of the conference was the consideration of a paper upon "Co-operation and Garden Cities," submitted by Mr. Ralph Neville, K.C. Mr. Neville maintained that the conditions of life in great towns had been proved to be conducive to degeneration, disease and death. When it was remembered that in England the agricultural population already bore to the town population a smaller proportion than in any other great country, while this proportion was continually decreasing, the gravity of the position would at once be appreciated. The problem with which the Garden City Association sought to grapple was how to save the people from the consequences of a movement which they were powerless to prevent; if men must live in towns, how was town life to be rendered consistent with healthy development? In the case of existing towns, where the land in and about the town was in the hands of private owners, who were, from the nature of the case, monopolists, the ground value was already extremely high, and every improvement added to the value of the monopoly. The result was that any change radical enough to achieve the object in view was prohibited by the cost it would entail. The high value of the land was a by-product of the activities of the townspeople, but under present conditions they were constrained to make a present of it to the landowners. Townspeople could, by intelligent co-operation, make themselves the owners of the land in and about their town, and thus make available for their own purposes the entire product of their own exertions. The desire of the Garden City Association was to afford an opportunity for the practical application of this remedy. Their scheme was based upon three essential conditions:—The purchase, at agricultural prices, of land for a city; the retention, for the benefit of the community, of the increased value of the land created by the community; and the permanent restriction of the area to be covered by buildings. In such a city, while the cost of production, as far as space was concerned, was reduced to a minimum, every man would have at his door the opportunity of a healthy existence, and the enjoyment of the gifts of nature would not be divorced from the stimulating intercourse with his fellows. The most obvious objection was that

the scheme would take a great deal of money to start. They believed that the money provided would prove to be safely invested at 4 per cent. or 5 per cent. interest, while the experiment, if it proved successful and led to a gradual distribution of the population over the land, would have rendered an incalculable service to the Empire, the future of which depended far more upon the capacity of our people than upon the extent of our dominions. They heard of the over-population of England, but upon the lines laid down for the garden city, which allowed five persons to the acre, the south-eastern district alone, comprising the counties of Surrey, Kent, Sussex, Hampshire and Berkshire, would absorb the population of London nearly four times over, in addition to its existing population.

Mr. Neville maintained that the supreme merit of Mr. Howard's scheme, the economic basis upon which it was, he thought, surely and securely founded, was not that it would give to the residents in the garden city all those advantages which it was desirable that they should enjoy, but that the money with which these advantages could be given would be secured by the automatic rise in the value of the land, which would take place as soon as people were attracted to the city. The "unearned increment" which went to the landlords throughout England would make a total so enormous that if it could be calculated it would perfectly stagger them. If they could point to one city like that they would have made a great advance towards solving great social questions, and would have paved the way for municipal councils and local bodies to follow in their footsteps. The lines upon which they proposed to proceed were first to get an option over a tract of land, then float a company, buy the site, and start erecting the city. The company in the first place would have the management of the scheme, with a view to giving local government into the hands of the inhabitants as soon as the scheme had sufficiently developed.

In a discussion which followed the paper Mr. Aneurin Williams advocated the introduction of co-operative principles at the outset, suggesting that the building should be done by co-operative societies, and that all the necessities of life should be supplied through co-operative producing and distributing agencies.

A hearty round of applause went up as Mr. George Cadbury, to whose splendid altruism the model village of Bournville is entirely due, rose to address the delegates. Mr. Cadbury gave some interesting particulars of his first conception of the

scheme. For forty years, he said, he had had a class for men in Birmingham, very many of whom had been drunken and profligate. Many years ago he was struck by the fact that when these men were reformed they had no occupation for their spare time and thought after the day's work in the factory was done. He came to the conclusion when he was quite a young fellow that the only practical way of raising them up from the degradation of their surroundings was to bring the factory worker out on to the land, and give him a piece of garden in which he could enjoy that most delightful of all recreations—the coming in touch with nature on the soil. A serious feature of our modern industrial life was the deterioration in physique of the workers. How was it possible to have a healthy race while the men were spending their days in factories and their evenings in clubs and institutes, or, a thousand times worse, in public-houses? A man must have fresh air and come in contact with nature if he were to have a really fine physique. They had a little object lesson at Bournville in their home for poor children out of the slums of Birmingham. He had had these children carefully weighed, and he found that on the average they gained 1 lb a week while they were at Bournville. Some had gained as much as three or four. What, asked Mr. Cadbury, would those children be if they were always living that life instead of the life of the slums? The audience saw the unconscious humour of the question, and laughed vociferously. Mr. Cadbury saw it too, and added, "Of course we could not hope that they would put flesh on at that rate always." The speaker maintained that a garden for the worker was most important from the point of view of economy. When he found his recreation there, not only was he saving money which he might otherwise spend in amusements, but he was making money besides. The question had been asked, "How could the poor afford to pay 5s 6d a week for a cottage with a garden?" Those who asked it forgot that 2s 6d might be knocked off that figure for the value of the garden produce, bringing the rent down to 3s., while it also resulted in the further advantage of an increased consumption of vegetable food and a decreased consumption of animal. Another question was, how far the removal into the country helped the manufacturer? The great difficulty which confronted manufacturers in a town was the securing of land when it became necessary to extend. In their own case they found an untold advantage in being out in the country. When they came out they employed 300 hands. Now they employed 3,400, and they had plenty of room to double or treble that number.

He believed the time would come when manufacturers would see that it was the best thing in the world for them to get out of the towns. It was a great undertaking at first, no doubt, but he had been recompensed a thousandfold.

The Town Clerk of Shoreditch asked what proportion of interest and repayment was charged upon the dwellings in the Bournville Trust, and Mr. Cadbury replied that the freehold of the trust was handed over to the trustees, and the whole income would go towards developing the idea. It was like a rolling snowball, gathering as it went. The income that year would probably be 6,000*l.*, of which he supposed 5,000*l.* would go towards building new cottages and improvements. Every twenty years they hoped that it would double itself, so that in forty years it would be 20,000*l.*, in 100 years 160,000*l.*, and in 150 years 1,000,000*l.* In reply to another question Mr. Cadbury said that the first 150 houses built were practically sold out and out. They were sold to the tenants on 999 years' leases, of course with certain conditions to prevent the character of the village being destroyed. It was found, however, that the tenants were selling at a profit of sometimes as much as 25 and 30 per cent., and were thus securing for themselves the "unearned increment." It was felt that this money ought to go to the trust and be utilised for extending the scheme, and providing more residences. Therefore, the selling of the houses was discontinued. His son was now building houses which would only be let to men earning 18*s.* or 20*s.* a week. This would cut off all their own workmen and provide for the poor of the surrounding district.

Mr. Brooks, of Birmingham, who represented the Gas-workers and General Labourers' Union, thought it was the constitutional conservatism of Englishmen, and especially English working men, which would prove the greatest difficulty in the way of the realisation of the garden city scheme.

Mr. Mansfield Robinson, the town clerk of Shoreditch, was very enthusiastic on the subject of Bournville. There, he said, they had got a successful experiment of a garden city. They wanted no more experimenting. They wanted to get to business. He pointed out that Shoreditch was about to spend 250,000*l.* in improving one of the worst parts of their district. That sum would have been sufficient to have bought a garden city right out from top to bottom. He declared that there were places in England where agricultural land could be bought as low as 5*l.* an acre, and he then drew a vivid picture of the degradation and immorality which resulted in great measure from the overcrowding in London and other

great cities. He thought that a scheme such as was proposed, in order to be successful, ought to be put, if possible, upon municipal lines.

A number of papers upon various aspects of the scheme had been prepared, but in order to save the time of the conference they were handed round as printed pamphlets, and were taken as read, discussion being at once invited upon them. The initiator of the scheme, Mr. Ebenezer Howard, set out a number of sound and convincing reasons why manufacturers and co-operators should unite with others in building a garden city, and why those interested in improving the condition of the working classes and the general well-being of the community should take an active part in assisting such an enterprise.

Dr. Winslow Hall gave details of the sanitary arrangements which would be essential to achieving the ideal garden city, and Mr. H. Clapham Lander, A.R.I.B.A., dealt with the bearing of co-operation upon the scheme, with especial reference to co-operative housing. From the pen of Mr. Raymond Unwin, M.S.A., there was an illuminating article upon the arrangement and building of such a city as was proposed.

An interesting discussion ensued upon these papers.

Mr. Rowntree, of York, laid stress upon the difficulties which confronted manufacturers in removing their works into a new and especially a rural district, but Mr. Mainwaring claimed that these difficulties had already been answered by Mr. Cadbury.

Mr. Howard, replying on the discussion, also laid stress upon Mr. Cadbury's success. When they saw, he said, that Mr. Cadbury as a single individual had built Bournville and given 300 acres of land to the English people, they could not believe without slandering the race that the people of this country, if they believed in the project, would fail to find the money to carry it out. He did not care whether the scheme was carried out by a municipal or any other authority, but he did contend that no municipality had anything like power to carry it out. He did not doubt that it was very difficult to produce the concerted action among manufacturers which was necessary to the success of the scheme, but if they never attempted anything that was difficult they would never achieve anything that was worth doing. He felt very strongly the importance of the question as it affected the morale and physique of the people.

The Mayor of Camberwell (Mr. Matthew Wallace), then proposed a resolution thanking Mr. Cadbury for his hospitality, and expressing the delegates' deep sense of the value of Bournville as a step in housing reform, and their

earnest resolve to do what lay in their power to follow so splendid an example.

This was seconded by Sir M. M. Bohnaggee, M.P. In the great and burning question of housing reform, he remarked, Mr. Cadbury had indicated a direction of activity which would not only engross the attention of manufacturers and private citizens, but which would, he believed, set the Government and municipalities thinking whether it was not in their power to solve the great problem which had presented so much difficulty, and which lay at the root of the happiness of the working classes, and therefore of the prosperity of the country at large.

The resolution was carried with enthusiasm, and Mr. Cadbury, after acknowledging the compliment, proposed a vote of thanks to their chairmen, Earl Grey and Mr. Neville.

Earl Grey assured the delegates that he considered it an honour to have been asked to preside over that conference. He did not pretend to be able to say whether the scheme of which he had heard so much that day was practical or not. He read with a great deal of sympathy Mr. Howard's book when it was published, and he did see certain difficulties at that time in the way of the adoption of the scheme, some of which he thought he saw still. He had come there because he believed that Mr. Cadbury had set England an example which ought to be followed, and if his work could only be sufficiently known by other employers, if they could only realise what he had told them that day, that it was good business for the employer of labour to plant his works in the fields outside the cities, there would be a greater desire on their part to follow the noble and splendid example which he had set them. Never in his life had he (the speaker) experienced a happier feeling of relief, or a more full and confident hope as to the future of his country, than one day last year, when, having to spend a night at Birmingham, and not knowing what on earth to do, it occurred to him that he could spend the night at Bournville. He went there haunted, as many of them who thought seriously about the future of the country must have been haunted, by three ghastly and awful phantoms, which he could not banish from his mind. The first was the dismal fact that the third generation of Londoners did not have children, or, if they did, those children were narrow-chested guttersnipes, very different from the happy breed of Englishmen which had been the glory of this country. And when one reflected that big London was steadily growing and that the population nurtured in the country was steadily diminishing, one could not but reflect

that the day was not very far off when the invigorating stream from the country, which imparted stamina and nerve into the town-bred, used-up population of the cities, would cease to flow, and there would be nothing left but a miserable and stunted race. The second horrid thought he had was that, owing to the relations of capital to labour, and to our present industrial system in which all industry was based upon the fact that the worker was a hireling and not a partner, they had a system which encouraged the worker to regard himself as a cog in the machine, and which was responsible for the very prevalent belief that there was only a limited amount of labour to be performed by the nation every year, and that therefore it was the duty and interest of the worker to make his work as little efficient as possible in order that the labour might be spread over the largest possible number of hands. What did that mean? An industrial system founded upon such a basis must tend to prevent the development of individual excellence, must be ruinous to the development of character and fatal to the national and individual prosperity. The third dismal thought which he had was that there were thousands of his fellow countrymen who had no place to go to to escape from the deadly monotony of their lives other than the public-house. His haphazard visit to Bournville blew away all these nightmares. He saw light upon the mountain tops. He saw a place where men could enjoy God's fresh air, with the social intercourse and attractions of the town, a place where workers were partners with the employers in the industry which gave them employment, not individually, perhaps, but collectively, by sharing in the prosperity which came out of the profits from Mr. Cadbury's works. He found also that at Bournville there were so many attractions to occupy the leisure hours of the workers that there was no necessity for a public-house at all. Whether they could persuade different businesses to combine together and plant their enterprises at the same time on open spaces away from a city he had his doubts, but he had no doubt that it was open to-day to manufacturers, and would be more and more open to them and to their advantage, as electrical development made locomotion and the transmission of power easier, to establish the head centre and the workshops of the industries in the open fields. And when that day arrived he thought the great fears which had weighed like nightmares upon their minds, as to what the future of the race was to be if the people of England were to be purely town bred, would be removed, and that they might look forward to a new lease of strength and prosperity and greatness.

THE WEEK.

THE Winchester committee who had charge of the ALFRED Celebration are to be congratulated on having passed through the Millenary without incurring any debts. There is even a balance remaining, the amount of which cannot be large. The local mayor has proposed that the money should be utilised in raising and conveying to Winchester the so-called "Viking Ship" which is embedded in the river Hamble. An operation of that kind must be necessarily expensive; in the end it might cost as much as the Celebration. The barge is about 130 feet long, and its depth remains unascertained. It is firmly bedded on mud and peat, and so ancient a structure would require to be handled with tenderness or it must collapse. The removal could only be attempted when the tide in the creek is at its lowest, and under those circumstances the expense of raising would be increased. At present the character of the "ship" is suggested by the wreck, but once taken from its damp enclosure the sides are not unlikely to become slush. If it could be transported to Winchester shed would have to be erected for it in which special atmospheric conditions would have to be provided, for it is common experience that wood which can remain in water loses its character in dry air or air that is alternately dry and damp.

THERE is no opposition between the Lord Chamberlain and the London County Council in regard to regulations for the safety of the public in theatres. Fire-resisting curtains are to be introduced in the proscenium openings of the Lyceum, the Criterion, the Vaudeville, the Strand, the Britannia and the Elephant and Castle Theatres. In the Standard the seats of the pit have to be rearranged. Other requirements are also to be carried out, and licenses will not be granted unless the Council's suggestions are realised. The effect of the unanimity between the two departments will not be confined to London, and we may expect that throughout the country the local authorities will be no less decided in their efforts to make theatres safe.

MUCH was anticipated from the superintendence by DON ALVAREZ of the Prado Gallery in Madrid. Since his appointment he has shown himself to be an active director. He was eager to make the famous collection of pictures more effective in the education of the Spanish artists of the future, and he was enabled to make arrangements which would conduce to that end. It was also his ambition to render the gallery secure against fire, for he had not that immunity from danger which was an inheritance of his office. As a representative of the modern Spanish school he had gained distinction. It has been calculated that he produced 350 paintings, and his drawings and studies are numberless. Like most masters of the present school of Spain he loved costume pieces, and many of his works are representations of incidents in the eighteenth century. For his *Carnival* in 1800 he is said to have received about 6,000*l.*, and his *Marriage of a Roman* brought him 3,500*l.* ALVAREZ studied in Rome and resided there for a great part of his life, and when he died on the 4th inst. he was in his sixty-fifth year.

WHENEVER a candidate aspires to have a share in local government his first step is to pose as an economist, whose one ambition is the reduction of taxation. Should he gain a seat, he either contrives that his memory should be so far from being improved that he is taught the lesson that taxation is more likely to be increased instead of being diminished. As there is a great risk if the rates are increased, an effort is often made to extend the basis of taxation. An ingenious, if not an attempt of that kind was heard before Judge J. H. STINEAU at the East Sussex Sessions on Tuesday. It was an appeal brought by Messrs. HOWE & Co. and the Granolithic Stone Company against the Hailsham Assessment Committee. The appellants had entered into a contract with the East Sussex County Council for one of those immense lunatic asylums which

unhappily have to be erected throughout the country. The assessment committee took advantage of the works as if they were lines of streets, and assessed them item by item.—workmen's sheds, workmen's canteen, workmen's sleeping houses, engine-house, and whatever else of a temporary character could be discovered, were all assessed separately. Even the rails were treated as if they formed part of a successful railway. Now it could not be shown that profit was derived from any of the items, and with as much reason all the plant belonging to the contractors could be rated. The Judge, however, at once, in spite of the arguments of Mr. MACMORRAN, K.C., decided in favour of the appellants. Their occupation, his Honour said, could not be considered a ratable occupation. There was no exclusive occupation, and the Court thought that such occupation as was necessary for the construction of the works was not an occupation in respect of which a rate could be made. The Court was also of opinion that the rate was not legal, and the entries in the rate book would have to be struck out. Rating authorities are generally endowed with imagination, but a more preposterous claim could not be raised by any of the unfortunate people for whom the asylum is being prepared, and we hope its failure will be taken as a warning by other public authorities who show a disposition to meddle with contractors and delay the completion of important undertakings. In such cases assessment committees should be compelled to pay all the expenses of the litigation out of their own pockets.

FROM time to time panics arise about "rings" in building and other contractors' works. Just now the people of Manchester are suffering from the epidemic. One of the cases which has given rise to the commotion has been the acceptance of tenders by the electricity committee of the City Council for the construction of two chimneys and the foundations of engine-beds at the Stuart Street generating station. In the beginning of last month three tenders were received, and it was decided to accept one from Messrs. NORMANTON, although there was another 1,300*l.* less and a second 1,100*l.* less. Some difficulties arose about the time in which the work was to be completed, and it was decided that fresh tenders should be obtained. The tender of Messrs. NORMANTON was again approved, although one by Messrs. HEALEY was 126*l.* lower. A member of the committee proposed that the latter should be accepted, and he asserted that a "ring" existed among builders, and it was not an uncommon thing for certain firms to arrange their prices accordingly. The chairman of the committee affirmed that there was no evidence of the existence of a ring, but in any case the committee could not contend with it, especially at a time when work had to be done as speedily as possible. It does not follow, in any case, that because the highest tender is 7,840*l.* and the lowest 5,750*l.* there is a conspiracy in favour of a particular contractor. If work is to be done in a hurry it costs the contractor more than work that can be carried out under ordinary conditions, and a corporation or a private building owner must expect to pay for the peculiar circumstances of the case. It is easy to get up a cry of rings and illicit commissions, but the majority of people should have had sufficient experience to convince them that combinations to accomplish roguery do not arise every day.

THE financial difficulties of Paris have caused some consternation, among those especially whose property consists of "obligations" of the city. One effect has been the breaking off of the negotiations for the purchase of the fortifications as a whole. It is now understood that the French Government, recognising the condition of affairs, have agreed to allow the land to be purchased in lots. It will not therefore be necessary to impose at once the heavy burden of interest on the total outlay upon Paris, nor to undertake the no less costly work of laying out a new district with roads, drainage, &c. When the ground is let in portions the revenue from each of them will become part of the municipal wealth, and in course of time the whole of the site of the long line of fortifications will be merged in the city without any extraordinary sacrifice of the present inhabitants.

THE BORGHESE VASE.

ALTHOUGH it is not of a severe type, the Borghese Vase is one of the most admired examples which antiquity has bequeathed to us. It is devoted to BACCHUS, and suggests the exhilaration of spirit which was associated with the god. It was found on the site of SALLUST's garden at Rome, and we may therefore assume it was one of the ornaments of the famous grounds or of the villa they surrounded. Although CAIUS SALLUSTIUS CRISPUS belonged to a plebeian family he possessed the most costly tastes. He was an opponent of the aristocratic party, and in his writings endeavoured to exaggerate the evils which arose from POMPEY, their leader, and all who followed him. But there was no trace of the ancient Republican simplicity in SALLUST's life, or in the superb palace which he erected in Rome, and which was afterwards used for many years as an Imperial residence, until the building was destroyed and the gardens devastated by ATTILA.

The traditional pedant, who went about with a brick in his hand in order to convince people of the character of the house in Athens which he wished to sell, was not such a fool as was supposed, and, indeed, in ancient and modern times houses have been purchased on the faith of evidence which was less convincing. We believe there is reason for concluding that the vase we illustrate was in keeping with the decoration with which SALLUST surrounded himself, and which would be therefore of a free and joyous character. The ivy-crowned god, who was ever fair and ever young, was an appropriate deity to preside over a seclusion which was believed to contain all that art could furnish for the enjoyment of luxurious people.

The vase, which is nearly 6 feet in height, is a crater, the vessel in which the wine used to be mixed with water. From the time of HOMER the crater was a favourite object on which Greek artists exercised their skill. A great many are mentioned in poems, legends and histories, and care is taken to describe the decoration. A crater was

an usual gift to a temple, where many were employed as utensils in the service, for the sacrificial libations were mixed in them. Among the charges made against VERRE was the removal of the most beautiful craters which were found in Syracuse, and which were probably derived from the temples. It is impossible now to say whether the Borghese Vase was simply a sculptured decoration in the form of a crater, or whether it had been used for mixing

wine or water, for which it would serve. The handles below the decoration may have formed the termination of the handles. But whatever its purpose the relief upon it was admirably adapted for the adornment of a vessel which contained an intoxicating drink, although it would be out of place if the contents consisted of fresh milk and sweet oil, for which a crater serves in one of the idyls. The figures of BACCHUS, SILENUS, the fauns and the Bacchantes are appropriate, and there is a spirit of wild revelry which is not, however, carried to an excess that would be repelling, and therefore warning against the use of wine. SILENUS is overcome by his potations and is unable to reach the carchesium, but a SILENUS that did not need support would appear to be untrue. There is a contrast between his helplessness and the activity of the faun near him, who is seen to be executing the athletic dance known as sikinnis. It should be noted that in some of the Bacchic dances the most illustrious men in a State were prepared to join,

THE BORGHESE VASE.

when they were allowed to accompany their steps by clashing their swords against their shields the excitement became almost ungovernable. One Bacchante, it will be noticed, uses crotala, or castanets, while another shakes a tambourine or tympanum. Near to BACCHUS is his panther. The vase was a favourite accompaniment in the festivities.

The composition in a limited space expresses a Dionysian or Bacchic spirit. In our sober times the festivities may seem to be adapted only for boors, but we should remember that the dithyramb or song of the god, which was chanted on such occasions was adapted to

RELIEF ON VASE.

wards to the Doric chorus, and in that way was the origin of the sublime Greek drama. The song of the Satyrs or tragoi developed into the great tragedies. It was a distinction for the chief archon to supply such a chorus as would be able to render the alternations which were demanded by the nature of the composition. THESPIUS was the leader at some festivals, and his name has become immortal. ÆSCHYLUS did not disdain the introduction of the Bacchic chorus in his tragedies. The delight of the people to take the humblest part in the representations has been explained by MÜLLER, who says:—

The intense desire felt by every worshipper of Dionysus to fight, to conquer, to suffer in common with him, made them regard the subordinate beings (satyrs, panes and nymphs, by whom the god himself was surrounded, and through whom life seemed to pass from him into vegetation, and branch off into a variety of beautiful or grotesque forms), who were ever present to the fancy of the Greeks, as a convenient step by which they could approach more nearly to the presence of their divinity. The custom so prevalent at the festivals of Dionysus of taking the disguise of satyrs doubtless originated in this feeling, and not in the mere desire of concealing excesses under the disguise of a mask, otherwise so serious and pathetic a spectacle as tragedy could never have originated in the choruses of these satyrs. The desire of escaping from self into something new and strange, of living in an imaginary world, breaks forth in a thousand instances in these festivals of Dionysus. It is seen in the colouring the body with plaster, red, vermilion and different sorts of green and red juices of plants, wearing goats' and deer skins round the loins, covering the face with large leaves of different plants; and, lastly, in the wearing masks of wood, bark and other materials, and of a complete costume belonging to the character.

With the Romans the Bacchic festivals degenerated, and they were marked by horrors which would amaze one of the Greeks. The excesses were carried to such extremes, that it was found necessary to suppress all Bacchanalia, or if there were devotees who believed they were a religious function, they could obtain permission for five persons to assist at them from a senate consisting of not less than a hundred members. The Romans, unfortunately, had no sense of measure, while with the Greeks it was supreme.

THE INVISIBLE IN ARCHITECTURE.

In modern times, when realism is in so much favour, people seem to think that everything can be made plain to the understanding. What is the worth of a picture that does not exceed the reality of a photographic representation by displaying colour as well as form? Architectural qualities are also supposed to be all-manifest, and such qualities as greatness, majesty, beauty, sublimity and so on are generally fancied to be no more than expressions, of which equivalents could be found in feet and inches. The Orders used to be studied in that way alone. There is still, however, truth in what CARLYLE said, "The eyes see all that it brings the power to see," and thus behind outward and visible material it can perceive, it may be called, the force, the "je ne sais quoi," which makes a building impressive. The difference therefore between the opinions which are uttered about the qualities of a building could be ascribed to varying degrees of knowledge, or to a want of insight, as well as susceptibility, and what to some appears extraordinarily grand may be to others only a pretence of power and majesty which can be tested by the laws of the dimensions.

It is this peculiar vision which explains the varieties of criticism on Mediæval structures which have been pronounced since the style ceased to find favour. It cannot be denied that in the eighteenth and nineteenth centuries men who were remarkable for taste and who were skilled in the exercise of judgment condemned all Gothic forms as barbarous. The English ADDISON can be taken as a type of the class of those critics. He was brought up as it were in the Classic atmosphere as was to be found in this country, and to admit the worth of anything which was outside his Oxford curriculum would be a derangement of his entire mental system. But there was much more in the history of humanity than was comprised in his philosophy, and with a wider education we find a more generous

appreciation of the principles of which Gothic columns and arches are material exponents. Against ADDISON as the representative of one way of looking at things we can set HEINE. He, too, came under religious and academical influences, but he had studied nature as became a poet, while ADDISON, who was no more than a versifier, was blind to all that is contained in that most eloquent and inexhaustible volume. ADDISON was of a cold disposition, but HEINE was infinitely more sensitive, and appeared to be destined for a victim, who was to suffer all the sorrows that can befall man. When, therefore, he undertook a work on the history of religion and philosophy in Germany, he treated a Mediæval church as a representative of both, or as if it were a microcosm in which not only the art of several centuries was to be found, but the mental soarings of men who had been trained in subtleties which were believed to be competent to deal with theological mysteries as well as with everyday life. The Church was then an omnipotent power, and its spirit was exemplified in architectural forms as well as in the manuscripts of cloistered mystics. At a later time RENAN discussed the Gothic which immediately preceded the Renaissance in a similar style, and demonstrated its correspondence with contemporary speculation in various fields. Critics will incline towards ADDISON or HEINE in proportion as they can realise the character of the style, and can turn their thoughts to the beliefs of which the greater part of a cathedral or a church formed the symbols.

What is perhaps most noticeable in Pointed architecture is that while so much is intended to have a relation with what is beyond the world, there is so much recognition of nature. It might be concluded from compositions which were familiar to people of the Mediæval period that the world they inhabited was assumed to be a dreary place which was a constant trial to the virtuous, who accordingly kept longing for another state of existence. But the ornament, which must have been most attractive to the men who executed it and to the men who looked upon it, was either closely copied from natural forms or was a simple conventionalism of them which could be easily understood. Compared with the ornament of Greek temples the difference is remarkable. Indeed, many who have looked on Gothic buildings without knowing anything of the derivation of the forms, have assumed that not only the ornament but the most important parts were inspired by nature. Naves and aisles were said to be copies of alleys or groves of pines. The tracery and coloured glass of windows recalled the branches of trees with the sun shining through them. An architect cannot accept that view, but he is unable to deny that the carvers went to the fields for the models of their ornament. HEINE sees in all this evidence of a survival of the old nature worship which existed in Northern Europe from mythic times, and which his co-religionist, BARUCH SPINOZA, afterwards systematised. If so, Mediæval architecture would then express thoughts like those which now excite alarm in pious souls. It is more likely, however, that the ornament, being much less common than it is in these days, when it can be produced in myriad forms by the aid of machinery, was regarded with delight, both for the skill shown in its creation and in the associations which it recalled.

We cannot possess a complete collection of the songs and other poetry with which the ordinary people of the Middle Ages had some slight acquaintance. But we know that the minstrels, like later poets, endeavoured to make use of birds and flowers in order to impart beauty, clearness and emphasis to their verses. We might even assume there was a floral language which was more common than that employed in wit-combats and other contests of the bards. We should also bear in mind that flowers had a spiritual acceptance of which the key is now lost. Thus a lily which is found in a relief at Amiens is interpreted by one learned investigator as signifying candour, and the authority of St. BERNARD of Clairvaux, who was a prominent representative of Mediævalism, is cited as testifying to the resemblance. Enough of such examples are known to convince us that a Gothic church conveyed meanings to the people whose spirits were in unison with it, and which can only be inferred in our times.

The effect produced on the minds of worshippers was

evidently recognised as something which was not entirely satisfactory. This is seen in the determination of the founders to have a different type of building for the Cistercians, and of which the principal characteristic was to be the absence of ornament. To the modern mind it seems astonishing that any harm could arise from the employment of plant forms around the top of a column. But the founders were evidently better informed, and it will be admitted that the impression made by a Cistercian monastery on a modern spectator is unlike in some respects that made by a building of a less severe style. As the monks sought for sites amidst pleasing landscapes, they could not be haters of nature, but they distinguished flowers from representations of flowers, and although the dissimilarity may appear slight, there can be no doubt that the change gave satisfaction to at least one class of minds.

The difference between plainly-moulded capitals and those adorned with foliage corresponded with the manner of employing windows. The dim religious light in many cases approached the "darkness visible" of the poet. Buildings of the kind would be in unison with gloomy minds, and the effect of them is not always to be overcome by delicacy in the details of the masonry. We cannot, however, imagine the architect of the apse of Beauvais Cathedral having any fear of light, and from the difference it is allowable to conclude that a less stern view of human life was recognised. The influence which the two classes of buildings can exert on visitors in our time may or may not be in accordance with the feelings of an earlier period; but in both it is easy to realise that an idea inspired the character of the two varieties of works which is nowhere announced, and which is only to be ascertained by reflection.

SALTWOOD CASTLE.

KENT was from an early time found to possess peculiar attractions for invaders from the Continent of Europe. Those who succeeded in obtaining a landing and gaining possession of the country were careful to raise impediments against other strangers who aspired to be imitators. CÆSAR in his second invasion was taught that a fortified entrenchment was barely sufficient to resist the attacks of natives. His experience was advantageous to the Roman armies of an after time, and as a consequence several solidly constructed Roman stations were planned. Among them may be named Regulbium, or the Reculvers; Richborough, or Rutupia; Dover, or Dubra; Lymne, or Lemana; Canterbury, or Durovernum; Rochester, or Durobrivæ, &c. The Saxons made themselves more at home in Kent, which was wise, for they were not such military engineers as the Romans. But several invasions were evidence of the need of fortifications. The Normans were forced to endure the delays which a fortification could offer to the march of an army, and from time to time we hear of the scant mercy which was shown to a besieged party whenever entrance was forced into a castle. In their turn the Normans utilised Roman buildings as far as they could and erected others.

Among the ruins which have survived are those of Saltwood Castle, which is about a mile from Hythe. The town which it helped to protect, and it may be to intimidate, was one of the Cinque ports, and therefore of much importance. It is hard to say when a castle was first founded at Saltwood. There is a tradition that ESEUS or OISE, a son of HENGIST, erected a strong place on the site about 488. In 1036 a grant was made of Saltwood with Hethe or Hythe to Christchurch, Canterbury, the abbey to which the cathedral was attached. CANUTE, it is said, witnessed the transfer, but in that year he died at Shaftesbury and was buried at Winchester. There is no doubt that Saltwood from an early period was the property of the Abbey of Christchurch. We meet several references to it in the historical manuscripts published by the Royal Commission. The castle was evidently used as a prison by the ecclesiastical authorities. The Greyfriars, for example, in 1341 sent a petition in favour of W. DE SAUNDFORD, who was incarcerated in Castro de Saltwode, and which says, "Nous vous prioms quil ne soit si durement tenuz en prison, et qil puisse oyer sa messe, et aler sus; . . . kar sil soit

tenuz . . . en le manere com il est il ne purrast, a ceo qil dist, longement endurer." In 1440 ROBERTO CHICHELE was appointed constable of the park of Saltwood. It was a possession of the see of Canterbury. Saltwood was entered in Domesday. It was said to be held of the Archbishop by knight service, which was a common tenure of ecclesiastical property. The standard of value, however, for such an office is rather indefinite. It was expected that the land should be of sufficient area and value to support the dignity of a knight, and is generally taken at 800 acres, while the value varied from 15% to 20% a year. The Archbishop's knight was, according to Domesday, HUGO DE MONTFORT, and it is recorded that he carried out various works at the castle, which meant, of course, that it was brought as near as possible to the class of fortification which was approved in the eleventh century. His grandson took part in the contests between ROBERT and HENRY, the second and fourth sons of WILLIAM THE CONQUEROR; he was in favour of ROBERT, but when HENRY was established on the throne ROBERT DE MONTFORT exiled himself from England, and as a consequence all his estates were confiscated to the Crown. HENRY DE ESSEX, the standard-bearer to the king, obtained possession of Saltwood and rebuilt the castle. It was necessary, however, to have another rebuilding in

WEST ENTRANCE GATE TO SALTWOOD CASTLE, FROM MEA

the reign of RICHARD II. The duty devolved upon Archbishop COURTENAY, who was engaged also in the rebuilding of the western transept of Canterbury Cathedral after the fall of Archbishop SUDBURY in an insurrection. In 1580 the castle to a great extent succumbed to an earthquake, and apparently the cathedral authorities were unable or unwilling to undertake the rebuilding of a stronghold which was not adapted to peaceful age.

The scattered ruins (the illustrations are from photographs by Mr. NORMAN CAREW-DUNDAS) indicate the extent of the enclosure, which was somewhat elliptical in plan and contained about three acres. All the parts must have been of massive construction. The keep or gatehouse, which was flanked by circular towers, has still an imposing appearance. Over the moat was a drawbridge, and the hollows through which the portcullis used to be lowered are still visible, but there is no record that the building sustained attacks, and its worst enemies were time and the atmosphere, assisted by an earthquake. It is possible also the castle shared the fortunes of Hythe, which in the time of HENRY IV. was about to be abandoned by its inhabitants.

MANCHESTER SOCIETY OF ARCHITECTS.

THE opening meeting of the session of the Manchester Society of Architects was held on the 10th inst., when the president (Mr. Alfred Darbyshire) delivered his address. He reviewed the condition of the art of the architect and its practice at this the beginning of the twentieth century, and contrasted it with that in the early part of the Victorian era. He spoke of the difficulties that presented themselves to the man who elected to become an architect forty or fifty years ago. It was an age of Classicism at war with the Gothic revival. The men then practising architecture in Manchester were few in number, and, he thought, all of them under the Classic influence. They were turned on to the "five orders" which formed the basis of all the private and public architecture of this district; there were no technical schools, and no methods of teaching beyond the curriculum of the office. A time arrived, however, when this limited means of study ceased. The school of design became the school of art; the Academy of Fine Arts was established. In addition to these extra means of study the Gothic revival set in, and captivated them with its fascinating influence. They soon realised the fact that there was more in the development of architecture than could be got out of the "five orders." He next considered what had brought about its present state of prosperity and the conditions under which it was practised. There appeared to be two marked and important causes for the change in architectural practice. The first of these causes was the determination on the part of architects to throw off the shackles of severe Classicism and the tyranny of the "five orders." The second cause might be found in the increased opportunities for study outside the office walls. Schools of art were established, and the architect learned to become an artist. There were, too, public libraries, and the student became a scholar, and made himself acquainted with the various phases of development in the history of architecture; and, to crown all, a man arose who was to exhibit the beauties of Italian Renaissance in the streets of the city. Edward Walters struck the death-blow to the old school, which attempted to adapt Greek temples to town halls, Quaker meeting-houses, concert halls and infirmaries. He supposed there was scarcely to be found such an example in modern civic architecture where the whole character of a town had been so completely changed for the better by the genius of one man. It was true that Ambrose Poynter had built his National and Provincial Bank in Mosley Street, with its beautiful Italian façade (now the property and home of the Brasenose Club), and Grogan his exquisite example at the corner of St. Ann's Square; but he thought he was within reasonable bounds when he said that Walters inaugurated a new era in the civic architecture of Manchester. Mr. Darbyshire afterwards pointed out some of the defects which had arisen, perhaps as natural consequences, in the practice of present-day architecture. Increased numbers, he said, generated competition, and with a larger market of architectural practitioners the general public was apt to treat its relationship with the profession from a commercial point of view. Any sympathy with sentimental conditions which might have existed in bygone years entirely disappeared. For example, if a building had to be altered or enlarged, although recognised as a satisfactory work, and its author still living, the work was given to a stranger. Again, it was the custom in times past, when any work of consequence requiring special knowledge had to be realised, to consult the architect who by accident or inclination might have shown a capability for such work. Nowadays a general competition must be instituted, and hundreds of men must throw away their brains and money in a hopeless effort to win the prize and to achieve renown. It seemed almost a waste of time to write or talk about this system of competition. Until very recent days the methods employed were disgraceful, and unworthy of those who used the system to take advantage of professional talent. It was, however, satisfactory to admit that there had been an improvement in the conduct of architectural competitions, but until competition was limited, each competitor remunerated, and the result adjudicated by a thoroughly competent and honourable architect, the system would remain incomplete and a scandal. Although he entertained fixed and strong convictions on this matter, he would so far modify what he had said as to add that if it were possible by the means he had mentioned to secure genuine and honest results, then any dormant talent might be developed and reputations made through the medium of competition. Turning to other matters connected with architecture, he spoke of the decision of the Corporation of Manchester to establish a municipal office of architecture, to be presided over by an official to be styled "the city architect." What sort of a man, he asked, was to hold the office, and with what powers was he to be invested? Would the city architect decide the future artistic development of architecture in the city in addition to the technical points which might arise in the future? If the answer was in the affirmative it would be evident even to the non-professional mind that the acceptance of such a responsibility involved the

appointment of a man of high culture and great artistic knowledge. Or did the contemplated appointment involve the designing of all public buildings and edifices under the control of the Corporation? If such should be the case the profession would suffer materially. He ventured, however, to think that a result of this kind was not contemplated. He appreciated the desire of the Corporation to appoint a city architect, and would have him invested with power to condemn all ugliness and purely commercial street architecture, but it would be undesirable to place the future architecture of the city entirely in his hands. Mr. Darbyshire spoke of the resolution passed by the Council of the Society, in which the suggestion was made that the appointment should not prevent the Corporation from giving to practising architects all works of architectural importance which they may in the future contemplate as a means of securing more varied architectural treatment than would be possible if all designs emanated from one source. In reply to this resolution communications had been received from the Town Clerk and the Lord Mayor to the effect that it had been placed before the committee with whom the appointment of city architect would rest, and that no decision had yet been arrived at. There was another matter of great importance to the local profession. It required careful consideration. He alluded to the establishment of a chair of architecture at Owens College. The idea of a professor of architecture in connection with the University was not a new one. It had occupied the attention of some of the elder members of the Society for several years past, but it was only recently that the matter had assumed a practical form. It might be within the knowledge of members that a joint committee of the Society and the College had been appointed to take this matter into full consideration. A set of resolutions had been drawn up by the committee which explained the object of this important movement. In them it was pointed out that it is desirable to establish in Manchester a school of architecture on the same general line as those of the Liverpool School of Architecture and Applied Art; that to give effect to this object there should be a chair of architecture in the Owens College, with arrangements under which adequate preparation could be given for the existing Honours School of Architecture in the faculty of arts of the Victoria University; that in order to provide for a complete school of architecture it was essential that there should be co-operation between the city, the profession and the college. In particular, it would not only avoid useless expense and overlapping, but would also tend to efficiency if a large portion of the instruction on drawing and building construction were taken in the Municipal School of Art and the Municipal Technical School, and that these objects could be best attained by the appointment of a representative committee and of a single director who should also be professor of architecture at the college. Those resolutions were signed by the chairman of the college and by himself, and forwarded to the authorities of the Municipal Technical School and the Municipal School of Art. He regretted to say that after several interviews with the committee representing these institutions their efforts had so far proved unsuccessful. He could not think that the matter would be allowed to rest where it was, it certainly would not be abandoned. They must fix upon the man best fitted to fill the chair of architecture and then discuss a method of raising the funds to secure his services for a time at least, or till such time as a permanent fund could be raised for the endowment of the chair at the Owens College. Mr. Darbyshire afterwards spoke of the collaboration of the architect, sculptor and painter whose works were carried out in which an artistic ideal had to be realised, and gave some advice to the students of the Society.

A vote of thanks was passed to him at the close.

STONEHENGE.

IN a letter to the *Times* apropos of the article on the enclosure of Stonehenge, Professor Flinders Petrie writes:—

Permit me to thank your correspondent for the clear and judicial summary on the question of public rights in Stonehenge which appeared on the 8th. It seems that some public right of access must exist where there has been not only possible access at all times, but where also there has been in all memory actual daily use of the site by the public. Until this matter has been settled by law, it seems perilous for the landlord to be in the position of obtaining large amounts of money under false pretences if the charge is proved to be illegal.

It is greatly to be wished that some decent treatment of the first of our national monuments may be assured without the unhappy resort of enforcing legal rights, but yet no mere complaisance in an illegal encroachment should hinder public action if it prove necessary. The plea of obtaining money to improve the safety of the monument is groundless so long as the public are not asked to help. For my own part I would

rather give a thousand shillings to preserve Stonehenge than be fleeced of one shilling illegally.

In one point too wide an accusation has been made in saying that the present barbarous enclosure was agreed to by learned societies. This was by no means the case; the only persons who condoned this very dubious transaction were, I believe, all members of a single society, and certainly others with as good a right to be heard were curtly refused any voice in the matter. The affair has been kept covered by a vague statement about societies; but certainly the societies who represent scientific opinion have not been heard, and they would probably follow the president of one institute, who has already protested against any such unworthy course. The less the name of public bodies is brought into questions of legal rights the better for all parties.

The public should in every way support the official bodies of the locality in maintaining their rights, and be prepared to help any society which will defend our great monument from base uses.

LIVERPOOL CATHEDRAL.

A LETTER from Mr. Reginald Blomfield appears in the *Times*, in which he says:—Sir,—In your account of the proceedings of the executive committee of the proposed cathedral at Liverpool Mr. R. Gladstone is reported as having given it as his opinion that "there could be no question whatever in the minds of thinking people that Gothic architecture produced a more devotional effect on the mind than any other which human skill had yet invented." Mr. Gladstone was good enough to supply the dates of the precise period of Gothic (1220-1320) which commended itself to the judgment of himself and the committee, and the committee unanimously resolved that the style of their new cathedral is to be Gothic and nothing else. They also resolved on a method of procedure exactly calculated to prevent any architect of standing and experience from competing.

Their method of procedure is an affair for the committee, but their assumption of authority on a point of architecture can hardly pass unchallenged.

In the first place, the result of their decision will be that the architects who do submit designs will have no voice in the question of treatment. The committee have taken on themselves this special and essential function of architecture, and the architects are merely to prepare designs to a selected set of details, for we know by painful experience that by "Gothic" is understood a more or less exact reproduction of some mediæval building. Under the circumstances the committee are hardly likely to get a tolerable building, more especially as the method proposed for obtaining designs has been condemned by competent opinion for the last thirty years.

This, however, concerns the committee and the architects who compete. The amazing thing about the whole proceeding is to hear in 1901 a dogma as to the sacrosanctity of Gothic architecture (and even of a certain period of it) solemnly propounded and assented to by a committee of influential laymen and others responsible for a very important building enterprise. We seem to be back in the fifties, when this sort of view was taken as an article of faith by ardent young amateurs with High Church propensities. Were it not for the probable consequences there would be a pleasing interest in this quaint revival, sixty years out of date, of the views of the Cambridge Camden Society. Mr. R. Gladstone finds his devotions quickened by the Pointed arch, but surely this is rather a slender foundation on which to raise a law that is and no other is to be the only possible type of building under which future generations may devoutly worship. He appears to have forgotten that the Roman basilica was the original of the Christian church, and that for some eleven centuries Christians had to content themselves with the spiritual encouragement of the round arch or the lintel. Yet it is probable that these Christians had a capacity for devotion inferior to that of the Liverpool executive committee, and the growth of Christianity does not appear to have been retarded by the absence of the Pointed arch. It is surely the *ductio ad absurdum* of religious devotion to make it conditional on cusps and crockets.

No one would for a moment dream of reviving the futile old controversy of Gothic and Classic, a controversy based on a misconception of the nature of architecture; but what every intelligent person contends for is that in these matters there should be a fair field and no favour. Professor Thompson, as the president of the Liverpool Society of Architects, has put the matter clearly to the executive committee, and the committee rises superior to expert opinion with some rounding results to the logical mind. Either the spiritual thought and feeling of modern Liverpool are the same as those of the cathedral builders of the thirteenth century or they are not. If they are the same, no doubt the language of the leaders of Salisbury will precisely express the aspirations of

the Liverpool merchant and mechanic of this century; if they are not the same that language becomes meaningless as an expression of modern thought, and to insist on its use is to reduce the art of architecture to a masquerade and a sham. No doubt the sapience of the committee will find its way out of the dilemma and give the mere expert another necessary lesson.

GLENCORSE CHAPEL.

IN a letter to the *Scotsman* Mr. C. S. Aitken writes:—Will you kindly allow me a few more words on Glencorse Chapel ere the much-longed-for waters submerge the ruins of it again.

In a short paper contained in the *S. A. S. Transactions* for 1878-79 Mr. Andrew Kerr says that he visited the Glencorse Valley in 1828, when it was being turned into a reservoir. At that time there was very little of the chapel left; the walls were about 4 feet at the most above the ground. He refers to the tombstone, and gives the date as 1623, and also the dimensions of the chapel as about 40 feet by 20 feet. Within the last few days the south-west corner has been disclosed; measurements taken from this in connection with the built masonry in the north wall and the loose stones in the east end appear to establish the accuracy of these dimensions. Withdrawing, therefore, my former comparison with Dalmeny Church, I would substitute as the parallel that of Duddingston, with which it agrees in length, but is 5 feet less in width. Laying down the plan to these dimensions, and allowing the existing 2'6" as the thickness of the north wall, and the same for the south, and as would naturally be the case a little more—say 2'9" for the ends—we find that the area left is such that we can inscribe within it two equilateral triangles and a semi-circle, the radius of which is equal to half the width of the chapel.

This is so remarkable that we must conclude that the chapel was carefully planned on the lines of the best architecture of the period. The masonry of the south-west corner is of excellent workmanship, and as much like Norman as Early English.

Mr. Kerr restored the plan with the assistance of Mr. Ramsay, the then manager of the Edinburgh Water Company. Mr. Kerr was an enthusiastic antiquarian, and if he could do no more than what is seen in his "Transactions" sketch of the chapel, we may take it that no further information will be recovered of its architectural appearance. He mentions that the churchyard occupied at that time the space of fully a quarter of an acre, and that the boundary wall was visible about 12 inches above the ground, the Logan Burn running 20 yards south of the south boundary wall (remains of this wall may still be seen about 20 yards south of the chapel), and the March Burn 20 yards east.

It has been supposed that the chapel was erected by the St. Clair who accompanied Sir James Douglas in his journey to Palestine with the heart of Robert the Bruce, in gratitude for his success in killing the legendary stag; but whatever may be said as to the credibility of the legend, St. Clair cannot have been the erector of the chapel, for as was shown in a former letter, it existed in the year 1230, and probably even dated back to the previous century.

I find that I was mistaken in stating that the grave slab was covered by a cairn; but it should be understood that the stones which enclose it on the east, south and west are no part of the original building. They were not there in 1898, and very likely have been taken from the chapel walls since that time.

The chapel, I may add, is oriented, and I would venture to suggest, in view of the discovery of the fair hewn stones of the south-west corner, that some antiquarian of means might find it worth while, with the consent of the authorities, to excavate, so long as the present opportunity lasts, within the area and round about the chapel. I regret to say that the grave slab has been broken across within the last few days. It is pitiful to see so little respect paid to a memorial of the dead. The ground is surely worthy of all reverence as the place of burial of many of those who fell at historic Rullion Green.

The site of the ruin is at present more interesting than pleasing to look upon, but it is not difficult to imagine the appearance of the little sanctuary and "God's acre" in ancient times with surrounding ash and elm trees, the Logan Burn flowing on the south, with its little tributary, the March Burn, on the east, the valley overshadowed by Castle Law and Carnethy Hill.

The Institution of Junior Engineers will meet on Friday, October 25, at 8 P.M., at the Westminster Palace Hotel, for annual general meeting, presentation of the report of the Council, election of officers of twenty-first session and other business.

NOTES AND COMMENTS.

THE question asked by the love-lorn Verona girl, "What's in a name?" has been the subject of many comments, but the people of Crowborough would answer that a name is of the utmost importance in respect of drainage, especially in a town where people go for holidays. It had been arranged that a drainage system was to be carried out at a cost of from 30,000*l.* to 40,000*l.* from the plans of the District Council surveyor. That official had been considering the subject for at least ten years, and he had assisted Mr. BALDWIN LATHAM in the preparation of a scheme. He had also carried out drainage works, although not to the extent required in Crowborough. But at a meeting which was held on Monday it was proposed "that the electors of Rotherfield at this parish meeting assembled desire that the Crowborough drainage scheme be entrusted to some eminent sanitary engineer and not to Mr. JOHN TAYLOR, the District Council's surveyor." It was objected that fifteen years ago Mr. TAYLOR was in a different line of business, and although he had done his work as a surveyor efficiently, yet as he had not gained a name as one of the foremost engineers of the day it was unsafe to employ him. As one speaker argued:—"Crowborough lived upon its reputation as a health resort, and if it was set about that there was a system of drainage against which a single word could be said, it would do the place a deal of harm. If they were able to say, 'This place has been drained by the most eminent engineer that can possibly be got hold of,' it would do Crowborough good, simply as an advertisement. Every house in Crowborough helped to pay the rates of Rotherfield parish." The proposal, in spite of its manifest unkindness, was adopted almost unanimously. The subject does not concern Crowborough alone, for wherever surveyors are employed they can be made to suffer in the same way. After ten or fifteen years' experience as a district surveyor a man must be lacking in intelligence if he cannot prepare plans for a drainage scheme that will cost 30,000*l.* Moreover, the Local Government Board would not pass plans or allow the money to be raised unless it was found that the proposed works would be sufficient. At the present time surveyors carry out duties on most economical terms, because they anticipate that their experience will enable them to obtain higher posts. But men cannot be expected to put all their force into work if they are certain that for anything outside ordinary routine a specialist must be called in.

THERE are no men who are more opposed to the wild and whirling schemes of anarchists than architects. Cynics may say it is to their advantage to have buildings destroyed, but in such revolutions as are proposed there is little chance of reconstruction. Moreover, if people are afraid that buildings will not be allowed to endure, they will not invest money in them. An architect's interest is secured by the upholding of a stable society. Every architect in England must therefore regret that M. FRANTZ JOURDAIN should have appeared as a witness in favour of LAURENT TAILHADE, who was charged with inciting to murder before a Tribunal de Police Correctionnelle in Paris. M. JOURDAIN is as distinguished in journalism as in architecture, and certainly no one who admires his charming phantasies in expression could for a moment believe that he was capable of any of the brutalities of anarchism. It was characteristic of him that he should say that TAILHADE's writings were beyond the crowd, and were only intended for a very restricted number of enlightened gentlemen. The prosecuting counsel asked the witness would he have signed such an article, and M. JOURDAIN replied, "I am an architect and not a writer, and I could not permit myself to sign so beautiful an article." That was, no doubt, considered a witty explanation, but it was too frivolous to come from an architect. It had, of course, no effect upon the Court, for TAILHADE was condemned to a year's imprisonment and a fine of 1,000 frs. If his judges were English architects, the punishment would have been much more severe.

ILLUSTRATIONS.

CATHEDRAL SERIES.—CHICHESTER: EAST END OF RETRO-CHOIR, THE LADY CHAPEL, CLOISTERS AND SOUTH-WEST TOWER.

LONDON AND SOUTH-WESTERN BANK, LIMITED, WEST BAILING. FRONT VIEW OF BANK, LOOKING TO ENTRANCE.

THIS bank is a one-storey building erected on the fore-courts of a pair of small semi-detached houses, with a "lock-up" shop adjoining. The bank occupies the whole of the ground floor of one house, and the lock-up shop of the other, the upper parts of the two houses being converted into a flat as the manager's residence. The bank is built of Bath stone and Kentish rag, the columns being polished light grey granite. The windows and doors and all the internal fittings are in mahogany. The builders were Messrs. J. H. ADAMSON & SONS, of Putney; the carving was done by Mr. HITCH, of Harleyford Road, Vauxhall, and the architect was Mr. EUGENE C. BEAUMONT, of 78 Fleet Street, E.C.

BROAD STREET PLACE, E.C.

THIS building, now in course of erection on the site on which St. Mary's Catholic Chapel, Moorfields formerly stood, is from the second set of plans and elevations prepared for this site, as it was found necessary to abandon the first on account of a notice served by the City authorities that they required a portion of the site for widening Blomfield Street, so as to make the same 50 feet wide, with a bold circular corner at the junction of East Street and Blomfield Street. The property fronts these two streets and Finsbury Circus. The building is designed chiefly for offices, which are so arranged that they can be let to firms requiring space or subdivided into smaller suites. At the corner of East Street connecting with Blomfield Street an extensive space is proposed to be devoted to the purposes of a bank. There will also be good shops facing Blomfield Street.

The three façades will be constructed principally of Portland stone; marble will be freely used for the entrance halls and staircases, of which latter there are three, and in the well of each will be provided electric elevators. The floors of the halls and corridors will be laid with mosaic paving. The whole of the construction will be fire-resisting as far as is possible, and easy and convenient means of escape will be provided on the upper floors in case of fire. The front slope of the Mansard will be covered with green Westmoreland slates, and the flat roof with asphalt. The large offices will be heated by radiator and electricity will be used for lighting purposes. The difficulty in imparting architectural interest to a building of this type containing so many rooms is obvious to the initiated, and eighteenth-century English Renaissance was found to give the greater scope and harmonise best with the surroundings. The estimated cost of the building 140,000*l.* The contractors are Messrs. PERRY & Co., and the architect is Mr. G. D. MARTIN.

The site is of undoubted interest, as there are records to show that as far back as 1740 the Catholic community had two churches at Moorfields, but in process of time these were united, and at least one of the Fathers was sentenced to penal servitude for life for complicity in the Chapel services, so that Moorfields can lay claim to having priests who were the last in England to be tried for their lives and liberties.

In 1780, during the Gordon riots, the chapel was plundered by the mob and everything removed and burned, nothing but the bare walls remaining, and it is recorded that Father RICHARD DILLON was so maltreated that he died on August 20 of that year. The congregation, after the destruction of their church, gathered in a large hall near by until 1816, when an appeal was made by the Rev. JOSEPH HUNT, and this was so generously responded to that sufficient money was realised to purchase from the Fishmongers' Company the plot of land on which the church schools and presbytery of St. Mary's, Moorfields were built by PAYNTER & HAYNES, contractors, in 1817 at a cost of 26,000*l.*, after JOHN NEWMAN's design.

On the apse of this chapel was painted a remarkable picture, 55 feet by 33 feet, by AGLIO, of Cremona. Great efforts were made to remove this picture intact, but it was found impossible to do so. Portions, however, were cut out and removed, with the marble reredos, to the new chapel in Ropemaker Street.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting for the session 1901-2 was held on Friday evening last in the rooms of the Royal Institute of British Architects, Conduit Street, W., Mr. W. H. Seth-Smith, president, in the chair.

Votes of thanks were passed with acclamation to the Royal Institute of British Architects for its tenth annual grant of 100*l.* towards the educational work of the Association, and to Mr. Cates for presenting to the library books bequeathed by the late Mr. Arthur Cates.

A vote of condolence was passed to the relations of the late Mr. James Brooks.

Messrs. F. R. Herring and T. H. Swinyard were elected members.

The committee's report and balance-sheet for the past session was formally moved and adopted. The financial position of the Association is the best on record. The balance-sheet shows a surplus of 500*l.* on the year's work.

The President distributed the medals and awards (a list of the prize-winners has already appeared in *The Architect*), of which the following were the most important:—

A.A. Travelling Studentship, value 25*l.*, and silver medal, J. E. Forbes; second prize, value 5*l.*, L. G. Detmar.

A.A. Medal, value 10*l.* 10*s.*, G. Drysdale.

Banister Fletcher Bursary, value 25 guineas, and medal, T. F. Green; hon. mention, A. C. Bossom.

Andrew Oliver Prize, value 5*l.* 5*s.*, D. Anderson and R. E. Stewardson, æq. (prize divided).

Architectural Union Company's Prize, not awarded.

Essay Prize, G. H. Lovegrove.

The following address was delivered by Mr. Seth-Smith:—

The President's Address.

In doing me the honour of calling me to preside over your interests for a second year, you have imposed upon me the difficult duty of having to address you a second time.

To prepare a statement of general principles and of one's own views on various points connected with our art and our profession is a task easy of accomplishment, as compared with that of choosing a subject sufficiently interesting to form the keynote of another essay. Not that ours is so prosaic a calling as to be lacking in questions of importance; on the contrary, I suppose there is no other profession which gives birth to so many interesting controversies. But as we are an eminently businesslike society, I propose this year to be more directly practical, reviewing our recent work and sketching what I conceive to be the policy of the A.A. in the immediate future.

During the past session we have had to say farewell to the nineteenth century, and simultaneously to the longest reign and to the greatest and best sovereign that ever occupied the throne of this nation. One who for sixty-three years ruled us with wisdom and personal virtue. Two such events would mark any year as memorable.

As regards our own affairs, it has been a session of unparalleled prosperity, clouded only by the losses we have sustained by death, which has claimed eight of our members in the twelve months.

But some men there are whose passing leaves a great void, alters, in fact, for a time the whole complexion of things. Such men were John McKean Brydon, Arthur Cates and William Young. The first formally joined us only recently, the last was not a member, but all were warm supporters of our work. We can pay them no higher tribute than to say they possessed that admiration and trust to which their professional attainments as well as their personal goodness entitled them. Brydon was especially one of those who win all hearts. By his death many of us have lost a dear friend.

Mr. Cates became a member in 1847 and was hon. secretary in 1852 and 1853, so that his interest in this Association covers more than half a century, and that interest was as direct and influential at the end as in the beginning, for at the time of his death he was a most active member of both the education and the premises committees.

Success has attended all departments of our work. We have added 116 new names to our membership roll, besides reinstating six others, and our financial position at the close of the year has been the best on record.

The Sketch Book, which for thirty-five years has figured so largely in connection with the work of this Association, but has been hitherto run by an independent committee, with our indefatigable members, Messrs. William G. B. Lewis, William A. Pite, as editors, and Mr. Edgar H. Selby as treasurer and secretary, has, at the request of these gentlemen, been taken over by the general committee. In recording our debt of gratitude to those who have conducted it so long and so ably, and whose services we are fortunate enough to retain for the most part, I am sure you will agree that under the direct supervision of the general committee such a periodical ought to become a very valuable property. May I urge members to endorse the committee's action by supporting it, either as authors of plates or as subscribers?

The past history of this Association is a history of education. In accordance with its traditions we have, during the session just closed, tried to meet the demands of the profession and of the public for better education as far as those demands can safely be ascertained by a careful review of art feeling in the community, and the growing sense in the profession that with us lies in great measure the responsibility for raising public taste in building. This sense of the beautiful can only grow as it is nurtured by observing the objects of beauty it is our function to create. You have, after mature consideration, added to the curricula a day school, and with its opening next week we enter upon a course entailing increased responsibility upon this Association. You are probably all conversant with the general principle of which this school is the outcome, namely, that if a young man is not to waste his employer's and his own time it cannot possibly be a good thing that he should be plunged into a busy office without some preliminary training. It is difficult to imagine on what grounds such a principle can be objected to. We are happy in having secured the services of Mr. Arthur Bolton as head-master of this school. In his hands it is sure to grow and prosper as the evening studio has done under Mr. Lewis's direction. We feel satisfied it will receive the encouragement of the profession. Success depends on this. I would urge young men whose bent is towards architecture to enter this school, either directly or by agreement with the principals to whom they may wish to be articulated. I believe most principals of standing will be found willing to give such pupils as may be unable to attend the evening school facilities for attendance, if not regularly, at any rate for two or three terms at stated hours for certain courses they particularly need. Such an arrangement will be as advantageous to them as to their pupils, while those whose minds are not fully committed to this line in life will, by entering the school, have an opportunity of reconsidering their decision in the light of experience.

The *Times* in a recent article on "The Organisation of University Education in the Metropolis," made the following remark:—"Beyond one or two courses of professional lectures London has nothing in the nature of a school of architecture. It contains far more architects than any other city in the world, and annually adds a larger quota to the profession than any other centre. But it leaves them to pick up their art in the old-fashioned way and makes no organised attempt to provide modern instruction. The result is, whether on the constructive or artistic side, we lag far behind the United States, France and Germany." The last statement is true, but we may be pardoned for expressing mild surprise that the *Times* correspondent is not better informed as to the opportunities of obtaining a systematic training which this Association presents.

In no better way than by mingling socially and educationally as they do here with a body of enthusiastic fellow students and practising architects can men become emulous of the highest excellence. Nor indeed can they ascertain their own true level except by thus comparing themselves with those less or more gifted. All this gives a unique value to our Association as a training ground; and more than this, the control and direction of its educational scheme is in the hands of an executive representing, in due proportion, the enthusiasm and aspiration of the youth of the profession not less than the experience of men who have seen considerable practice. Our list of visitors to the School of Design shows that the best London architects are giving their valuable time in teaching us, while our new advisory council contains the names of nearly all the architect members of the Royal Academies of the United Kingdom.

A word here to our students in both evening and day schools. The committee too often observe a desire to go up for the R.I.B.A. examination after only a few months' direct preparation. This means cramming; cramming means working at high pressure, and high pressure, as surely as a neglected education, spells failure: not perhaps in passing the formal test, but in practical success in after life, which every student will admit is the real goal of professional education, though he may not have grasped the logical conclusion of that admission. The A.A. will, I hope, never be a party to this sort of thing. You must go elsewhere if you want it. It is not education at all. Passing the examination will make a man neither a skilled draughtsman nor a good builder; but if he masters these essentials his success is assured, and they can only be attained by a long and patient course of work, systematised as carefully as it has been by this Association. Above all things believe that no system, however complete, can teach you architecture; at its best it can but provide conditions suited to work, and teach you where and how to learn. Your education, viz. your mental development, will be the result of your effort to apply the information offered and to work it out for yourselves.

If the diploma (membership) is sought merely as the Institute's assurance to the world that you have had such a systematic training, as a guide to the subjects which it is necessary to know, and as an incentive to work at them, surely

nothing but good can come of the examination which qualifies for that diploma. Let Emerson's testimony to our national character, written fifty years ago, inspire us to-day. In England, he says, "Every man is trained to some one art or detail and aims at perfection in that; not content unless he has something in which he surpasses all other men. He would rather not do anything at all than not do it well. I suppose no other people have such thoroughness."

As our art has a technical basis, this Association, if it is to become the educational power it aims to be, must act upon the universally admitted dictum so well expressed recently by Sir John Gorst, that technical instruction cannot possibly be assimilated by a student unless a proper foundation has previously been laid by a thorough grounding of elementary and secondary instruction. Surely this is also true of art. The more thorough an artist's general education the more alert will be his mind in all directions and the more rapidly will he appropriate and assimilate the special knowledge needed to fit him for his chosen life-work. I therefore hope that the committee will before long see their way to make admission to this day school conditional upon passing the R.I.B.A. preliminary examination or its exempting qualifications. And what is true of a broad grounding in general education in youth is equally true of early professional training. You must not specialise until you have some knowledge of every subject essential to the practice of every ordinary architect. The Association has been most careful not to introduce into its curricula any subject which does not come under this category.

We might just as reasonably continue to educate our youth in the old style as attempt to convey the Metropolitan water-supply in the good old wooden pipes we have just removed from the adjoining street.

Perhaps the most striking contribution during the past year to the discussion of this great question was Professor W. R. Lethaby's paper read before the R.I.B.A., entitled "Education in Building." It is an able history of the conditions under which architecture was carried on in the Middle Ages and up to the time of the Renaissance. He exhorts us by every means within our reach to encourage a high standard of practical excellence on the part of our executants (the British workmen), and to see to it that we ourselves not only understand building construction as the A. B. C. of our profession, but that we endeavour to bring about a more co-operative spirit as between architect, builder and mechanic. I hope all will read his delightful paper.

But even supposing the buildings of those times were not under the control of a "magister" who designed and commanded, but were the creation of an "operator ipse magister," as contended by Professor Lethaby, he appears to us to under-rate the effects of the vast social and educational change the whole community has undergone since the days of which he writes, and the impossibility of adjusting the old customs to modern requirements. Then it was only the king, the clergy and the nobility who were patrons of the building art. We now have a very numerous and educated upper middle class who can afford to build. Their travelling and knowledge makes them critics in the matters of art, and anxious to imitate the ancient work they have seen.

All this has resulted in a demand that those they employ to design and direct their projects shall be of their own class, shall know more than they themselves of the history and structure of these admirable works of old, and shall build with an approximation to the same feeling, shall in fact be scientific where they are dilettante. Professionalism is the expression of this demand for a high standard of training. Professional men, including those whose function is design and draughtsmanship, have come to stay. They form a large section of the upper middle class, and they are largely employed, not only by those of their own and of higher social status, but also by the numerous bodies representative of all classes alike, who prefer to be advised (in carrying out complicated architectural problems unknown to Mediaevalists) by men who have been thoroughly trained, through long years and at great cost, in the art of planning and in the knowledge of building construction, rather than by mechanics, whose blunders, inevitable where several trades are working without a general superintendent, would not be tolerated in these days of scientific method and exactitude.

It is a fault in our training that our pupils are not on the works enough, and that we do not specialise enough. Highly-trained men, with a diploma from a guild or an institute or what not, ought really, if our building is to be of the best, to confine themselves to design and the supervision of building construction and not to meddle with surveying, valuations and dilapidations, bills, &c., work which certainly does not savour of art. When as a profession we are more thoroughly trained, and when our occupation has obtained legal protection from the competition of unqualified persons, we shall be in a position to adopt more generally this higher standard of work. And when the last of these conditions is established the first will naturally follow and the public will employ us more generally.

The absolute necessity of some protection of the title of architect and its confinement to duly trained men is being more widely felt every year. In addition to the striking unanimity of continental professional opinion which I mentioned a twelvemonth ago, we now have the weighty and closely reasoned pronouncement of the President of the Institute in favour of something of the kind. A law has just been passed in California with this purpose, and I am convinced that the majority of provincial professional opinions in this kingdom is in favour of it. The Institute's policy, moreover, since the establishment of the examinations is incomprehensible and illogical, excepting as based on this principle. After all the proposal is only that the State should give us a justly acquired right to the expensively acquired skill and knowledge which it demands in the same spirit as it did from the Mediaeval Guilds, but in the manner dictated by the political and social conditions of to-day.

Gentlemen, if this Association is not to experience a serious check in its useful career we must now apply ourselves heart and soul to settling the vexed question of new premises. This may be done without undue labour if we all put our shoulders to the wheel, but not otherwise. I need not utter a word to you as to the urgent need for extension. We have completely outgrown our accommodation, and shall go on wasting money every year in trying to fit our square needs into round spaces until we can find suitable and sufficient room elsewhere.

You will recollect that after many years' search for premises adaptable to our wants we abandoned the effort as impracticable, and for the last twelve months or more we have devoted much time and thought to finding a site suitable for erecting a building such as we want. One such came before us this last summer, but it would have involved a capital expenditure of at least 18,000*l.* (including the premium for the existing lease), and the impossibility of ascertaining how much we could collect towards this before it was necessary to close with the offer convinced the committee that there was no other course than to make an appeal for funds this autumn and thus be prepared to take up the next suitable site which may come before us.

Freehold we are unlikely to be able to get even if we could raise capital enough. Ground rent, with rates and taxes, repairs and insurance added, are all we can at present afford to pay out of annual income.

We must therefore be prepared to collect the whole cost of building and equipment, and other expenses, a sum amounting (according to the two last building schemes gone into by the premises committee) to at least 20,000*l.* This estimate allows nothing for luxury, but would provide merely a simple building well-designed to suit its purpose.

The committee believe they already see their way to something like 3,000*l.* within the next three years, including specific promises they have received.

If every member of the Association would kindly undertake to collect (not necessarily to give) at least a guinea this session, we should have made a start, without external help, to the extent of about 5,000*l.*, a satisfactory guarantee of our enthusiasm and determination to have premises worthy of the work we are doing. It is, after all, the public more than the profession who will benefit by this encouragement of architecture in London, and we need not be shy in asking the support of our friends in so good a cause. When technical education is being so well endowed by private and public liberality, art surely may claim its due share.

Supposing our anticipations are realised so far, there ought to be no great difficulty in raising another 5,000*l.* from other sources within the present session, and with 10,000*l.* we might go forward in anticipation that a scheme so well inaugurated would be the best further appeal to the liberality of the profession and lovers of our art, and we might then reasonably expect to open our building free of debt within three years from the present date.

You may recollect the anecdote relating how Sir Thomas Lawrence offered his cartoons by Raphael and Michel Angelo to the Oxford University for 7,000*l.* The offer was accepted, and the committee, after collecting 3,000*l.*, called on Lord Eldon, asking for 100*l.* He put down his name for 3,000*l.* They told him they could easily collect the remainder. "No," said he, "your men have probably collected all they can spare; I can as well give the rest," and he wrote another cheque for the whole 4,000*l.* There are Lord Eldons still in existence; let us hope they still retain enough interest in art to put this great educational effort on a broad basis, for who knows how many Michel-Angelos, and not mere individual efforts of their prototype, they may thus bestow upon their country?

One of the greatest thinkers of the nineteenth century* directs our attention to a point which should encourage and stimulate us as individual students as well as an Association of

* Martineau.

Architects, viz. that "in proportion to the excellence of any form of being is its progress tardy and its cycle vast." He says:—

"Compare the different faculties and feelings of the individual mind. You find them appear in the order of their excellence, the noblest approaching their maturity last. Sensation, which belongs to man in common with all other sentient beings, is the endowment of his earliest days. Memory which simply prevents experience from perishing, which furnishes language to the lips and preserves the materials of the past for future treatment by the mind, ripens next. The understanding which makes incursions and wins triumphs in the fields of abstract truth is of later origin; while the great inventive power which distinguishes all genius, which seems to sympathise with the devising spirit of the artificer of things, to apprehend by natural affinity the most subtle relations he has established, and from old and gross material to create the useful, the beautiful, the true, is the last as it is the rarest and most glorious of intellectual gifts." Elsewhere he shows that the same principle applies to the works created as to the mind which originated them, thus:—

"As every great sentiment of the human mind shapes itself into expression in some form of art, it is fair to infer that a passion which has left no durable memorials . . . cannot have wielded any great power. In measuring the art of any people you find the proportion of their nature, for precisely here it is that the mind transcends the rule of mere utility and works to the scale not of any outward need, but of an inward affection that must come forth, and the deeper and more durable the feeling the less perishable are the monuments it creates. What then are the remains which you can study in the land of the Cæsars or the Ptolemies? The first obvious fact is that the buildings devoted to the convenience of the body are for the most part gone; while those that represent ideas of the mind are standing yet. The provision for shelter, the places of traffic, the treasuries of wealth, the home of domestic life . . . have crumbled into the dust . . . but the temple answering to the sense of the Infinite and Holy, the rock-hewn sepulchre where love and mystery blended into a twilight of surmise, the column or the bust of civic praise, grateful for services to the commonwealth—these survive the shock of war and the waste of centuries, and testify that religion, love and honour for the good are inextinguishable. . . . Suppose the ages to have done their work on this great Metropolis and buried all but its most durable remains. . . . There are the same great monuments of our humanity repeated still . . . but in the midst of them you discover vestiges to which Greece and Rome present no parallel. . . . Here we have a new sentiment—of sympathy with defective and suffering humanity, which in heathendom has left, so far as I know, not one memorial of itself, and which now vies in the solidity of its creations with the most ancient passions of the soul. . . . Examples these of the Christian sense of the infinite worth there is in man—his sigh for what he ought to be; his grief for what he is; his faith that the meanest is but the highest in germ; his vow to clear every burden from the lot, to clear every film from the mind that makes his poor brother seem less than a Son of God."

Yet as students we chafe under the long and patient training required to educate this high faculty, and as a class of artists we sometimes allow our enthusiasm to suffer because national taste is so slow in developing. No one will deny that the art of the European Renaissance is a higher and nobler thing than that of the New Zealand Maoris, or assert that the art of Greece was produced in spite of the high intellect and civilisation of that people. Let it suffice that we are progressing, and that time must be allowed in proportion to the excellence of our art. To us belongs only the responsibility of doing our best by cherishing at all cost the highest ideals and cultivating our personal talents to their utmost capacity.

Professor Beresford Pite, who proposed a vote of thanks to the President for his address, congratulated the Association on the year of unexampled success and the exhibition of drawings shown in the room. After such a display there could be no doubt as to the good work of the classes. The school of design called for special mention and reflected great credit on the visitors, those kind friends who were the spirit of it. The treatment of design was an important symptom of the progress of the profession and reflected its tone, and here again the school of design called for support. Architecture required artistic feeling on the part of the student, and all schemes of education would fail unless that feeling was invoked. Enthusiasm for the art should be cultivated. It was an important matter, but one difficult to dogmatise about, because it came in a different manner to different men. It was also well to cultivate sketching and a genuine enthusiasm for one's own home and homeland, and an interest in the traditions held by the men engaged in building work. Students were also advised to cultivate an enthusiasm for great men by reading their lives and studying their work.

Mr. Francis Hooper seconded the vote, which was passed with acclamation.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE annual meeting of the Architectural Association of Ireland was held on the 8th inst. at the rooms of the Association, Clare Street, Dublin.

Mr. Charles MacCarthy, city architect, presided.

The report and statement of accounts, which were of a satisfactory character, were adopted.

Prizes won during the past year were distributed, and an announcement made of the arrangements for lectures, &c., during the ensuing year.

Mr. Charles MacCarthy, the president, in delivering his inaugural address, congratulated his hearers on the success of the Association, which, though only a few years started, had already gone a long way towards accomplishing the objects with which it was started. He would much rather, he might say, be the President of this Association than President of that more venerable and, in many respects, more important body, the Institute of Architects. The reason of his preference was, this Association represented the younger members of the profession, and it was the young men who appealed to the imagination. After a man was forty he had either hit the mark or failed; the future belonged to the young man. It was to the younger men that the country must look for, should he say, the revival or the inception of a school of really national architecture, if, indeed, such a school be possible in Ireland. He was there tonight to ask the question, "Is a school of national architecture possible in Ireland?" He would suggest certain points of view from which the subject might be looked at, but it was for the members to answer the question, not in words, but in deeds. He for one, however, was hopeful that the question could and would be answered in the affirmative. It was quite true that the present was an age most unfavourable to artistic development. Still, in spite of materialism, the century just closed was not, even in the most material of countries, wholly unfavourable to other arts, such as poetry and music. If such arts as these had been able to withstand the blighting influence of a philistine environment, why should they despair of architecture? Architecture, compared with some other arts, was, in some kind, a practical necessity. Granted that a school or architecture was possible and necessary, it might still be asked, Would not the attempt to make it national end in making it narrow and provincial? Was not all great art cosmopolitan? To the first of these questions the answer was an unqualified No; to the second a very qualified Yes. Nationality and provincialism were as far asunder as the poles. As to cosmopolitanism in art, there, too, a confusion of thought existed. All great art must in its origin, its growth, its making, be instinct with the spirit of the country which had produced it, and therefore, in the true meaning of the word, national. But there was a sense in which great art was cosmopolitan, for as soon as any nation had produced even one solitary work of really great art, that work belonged henceforth to mankind. If he were asked to what branch of architecture he looked as holding forth the greatest promise of becoming the foundation of an Irish school, he would unhesitatingly say to ecclesiastical architecture. It was to the Catholic Church, the Church of the majority in Ireland, rather than to the State, the municipality, or to private enterprise, that they must look for the material out of which a school of national architecture was to be created. Few of them perhaps realised what vast sums of money had been spent on the building of Catholic churches within the last 50 years. He thought it must be reckoned by millions. It was a lamentable fact, however, that, from the point of view of architecture, there had been for several years a distinct retrogression. They could not conceal from themselves that church architecture in Ireland had fallen upon evil days. However much they might be disposed to blame the leaders of the Gothic revival in Ireland for having under the influence of Pugin adopted the English parish church as their model, instead of seeking inspiration from such beautiful examples of purely Irish work as were found in Cashel, Holy Cross, Cong, and the Black Abbey, Kilkenny, still they must admit that they at all events were earnest men, and that their works were remarkable for beauty of design, honesty of intention and sound construction. Could they say as much of their church architecture of to-day? Was it not, on the contrary, too often characterised by the absence of every one of these qualities? Intricate in design, yet absolutely without interest, the majority of modern Catholic churches were nothing short of a disgrace to the country. Flimsy in construction, ill-considered in plan and arrangement, made ridiculous by ill-placed, senseless carving and pretentious, but absolutely inartistic detail, these churches had been decorated internally in a manner of which literally he could not trust himself to speak. Yet he did not despair. On the contrary, he was filled with hope, because he believed that the lowest depth had now been reached, and that when things came to this pass they usually mend. But he had another and a brighter reason for hope. They must not forget that Ireland had a sound tradition

of fine architecture, distinctly and peculiarly Irish; while, in the decorative arts, such as stone carving and metalwork, their pre-eminence in the past was almost universally admitted. He knew it had been said that outside the Early Romanesque work there was little or nothing distinctly Irish in their architecture, and that the Gothic work of, say, the thirteenth, fourteenth and fifteenth centuries was largely English. That was, however, an erroneous opinion, as was pointed out by Mr. James Fergusson, whose "History of Architecture" was still the standard work on the subject. All the Gothic work in Ireland was, in fact, marked by what Mr. Fergusson called a foreign (that was an un-English) character, while the cloisters of Muckross, Holycross and Kilconnell were, he said, more like those to be found in Sicily or Spain than anything in the British Islands. Turning now to the present, he thought he could see the beginning of an art revival in Ireland. There was a movement around them which was national in the widest sense—not in any narrow or party or political sense—a movement which had already given them that most astonishing revival of the Irish language, and a revival less marked, but very real all the same, of music and literature. That this was certain to affect the artistic life of the country he for one could not doubt. If he was reminded that all this was largely a question of money, and that one could not afford to employ artists to paint the walls and windows, or carve the capitals and string-courses of every country church, the answer was that half the country churches would be very much better without either carving or painting. If in future they left out the Carrara marble altar, with its bristling rearedos, the vulgar stained glass from Germany, and that impertinent carved-oak pulpit from Belgium, and put the money into honest masonry instead, it would have cost them nothing, and they would have done a good stroke of work for architecture and for Ireland. The objection on the score of cost must therefore fall to the ground. It was to their architectural design that they should have to devote their attention in the first instance if they honestly desired better things. As a first step on their road they must break with the evil practices of to-day, and then, turning to the past of their own country for inspiration, let them study in the first place at least the simplicity and dignity so characteristic of their earlier Gothic buildings. Thus and thus only, he thought, could they hope to lay the foundation of a really national architecture.

Mr. J. Geoghegan moved a vote of thanks to Mr. MacCarthy for his address. He said in their Gothic churches in Ireland now they saw painted Renaissance to represent relief work and artificial shadows mixed up with the Gothic, and no plain wall surfaces were left.

Mr. Butler said they had reason to congratulate themselves that Mr. MacCarthy had had the courage of his convictions to speak out as he had done, and he wished that his address was in the hands of every parish priest in Ireland, for unquestionably the Catholic priesthood had the giving away of a great amount of architectural work.

The resolution was passed unanimously.

DURBAN TOWN HALL.

AT the Durban Town Council meeting on the 5th ult. the Mayor asked the Town Clerk to read the following report which he had drawn up, with reference to the proposal to sell the present town hall and to erect a new town hall building to accommodate also library, museum, art gallery and municipal offices. The report was as follows:—

My proposal is (a) that the present town hall block and land on which it stands be sold to the Government for the sum of 100,000*l.*, payable either by instalments or upon transfer; (b) that the new town hall buildings, at the cost of at least 100,000*l.*, to include town hall, library, museum, art gallery and municipal offices be erected on the town gardens, between the fountain and the court house boundary. With your permission, I interviewed the Postmaster at Durban, and explained to him my scheme. Mr. Coleman entertained the proposal and suggested an interview with the Postmaster-General and myself for the discussion of the matter. An interview was accordingly arranged, and after a most careful examination of the buildings the Postmaster-General stated he was in favour of the scheme, and promised to officially place it before the Government. His Excellency the Governor and the Prime Minister being in Durban at the time, I mentioned the matter to them. His Excellency was greatly interested in the scheme, the Prime Minister reserving his remarks until he had interviewed the Postmaster-General. I attach hereto copy of an opinion given by the late Hon. H. Escombe, Q.C., in regard to the uses to which the town gardens might be applied. The area has not been set aside nor vested in trustees, and can, therefore, be utilised for municipal buildings. The present town hall stands upon portion of the original market square, which extended from

Gardiner Street to, and including the police-station site. If the Corporation could sell the Government the site between the baths and the police station it can also sell the present town-hall site. If the scheme suggested be carried out, I would recommend that the exchange of sites lately arranged with Government be cancelled, both parties retaining their blocks. Owing to the recent fire at Poynton's Buildings, the post office authorities are anxious to obtain temporary use of portion of the old market house. This might, perhaps, be arranged. It is very necessary that additional accommodation be provided for the town office staff and this might be supplied by the borough engineer's department vacating their present offices and taking possession of the remaining portion of the old market house not required for post office purposes. Thereupon the offices at present occupied by the borough engineer's department might be used by the town treasurer's department. This arrangement is suggested by the borough engineer, who is of opinion that the necessary standing room for cars can be arranged, and to meet the requirements until such time as the new town hall building could be erected without removing the old market house. I would remind the Council of the agreement of the trustees of the public library to transfer the land on which the existing library stands to the Corporation as soon as suitable accommodation is provided elsewhere.

The Mayor said he had omitted to mention one question bearing upon this. It had been urged that they would be taking away one of the lung spaces of the town, but this was a mistake. The old market house would shortly be demolished, and the space taken up by the new town hall in the town gardens would only be about equal to the space released there. Naturally the matter was only of a tentative character, and nothing had yet been done in it.

Mr. Pickering, without saying whether he was in favour or not of the scheme, said he regretted that his worship had laid down the price to be got for the site and buildings. He took it that the amount which had been mentioned by the Mayor did not represent more than half the value of the site. If they regarded the price asked for the Field Street block between West Street and Smith Street, which was recently submitted for sale by auction, the block on which the town hall was built was worth at least 150,000*l.*, to which they must add the cost of the building, 50,000*l.*, making the whole worth 200,000*l.* He considered they would be making great sacrifices in offering the property at the price mentioned.

The Mayor said that there was nothing binding on the Corporation or the Government. The suggestion was simply one which he had made, and it would require to come before the Council for discussion before any steps were taken in the matter.

Mr. Taylor said that the amount which had been mentioned for the town hall and site was 120,000*l.* They did not propose to sell the whole block, but only the ground on which the town hall stood. The remaining portion of the block was required for their own purposes in connection with the trams. If they retained the town hall it would be necessary to enlarge it, and the only way they could go would be in the direction of the space required for trams, and it would cost about 25,000*l.* to extend the building. If they took these circumstances into consideration they would find that the sum mentioned was somewhere about the right amount.

The report was received.

THE AUSTRALIAN FEDERAL CAPITAL.

THERE is every probability, writes Mr. John Plummer, of Sydney, that the site of the capital of the Australian Commonwealth will be selected before the close of the year, and indications point to the selection of a locality somewhere between Sydney and the Victorian border. When the site has been decided upon it is pretty certain that prizes, open to the whole world, will be offered for the best plans for laying out the new city, also for the best designs for the leading public buildings. It will prove one of the grandest chances ever offered the architectural world, and already Australasian architects and surveyors are beginning to discuss the possibilities of the future. At a recent meeting of the Royal Society of New South Wales, Mr. G. H. Knibbs, F.R.A.S., one of the honorary secretaries, and lecturer in surveying at the Sydney University, read an interesting paper on the manner in which the proposed federal capital might be designed.

"Such an office," said Mr. Knibbs, "as the creation of a capital city, practically unhampered by any conditions of existing settlement, and limited only by the topographical features of any selected site, is a unique one in the history of a country; the manner in which that office is discharged is of an importance which can hardly be overrated. A capital city, its general design, its utilitarian and æsthetic features, constitute an enduring index of the intelligence and foresight, the nobility

of the sentiment, and the dignity of the artistic idea of the people creating it.

"The first point to be decided in elaborating a design for the streets of a city is the position of what may be called its chief radial centres and its main lines of street. A concrete idea of what is meant by chief radial centres would be reached by regarding such centres as the Capitol and the White House at Washington, or the Arc de Triomphe at Paris, between the Avenue de la Grande Armée and the Avenue des Champs-Élysées. . . . The selection of the position of the chief radial centres requires therefore not only a comprehensive view of the administrative, educational, industrial, residential, military and other needs of a capital city, not only a due regard for its communication with the outer world and for all the contingencies both in times of peace and war which that communication involves; it requires also a nice appreciation of the topographical adaptabilities of the site, so that in the design the interdependence and mutual influence of every element shall be fully estimated and the general arrangement made the most convenient possible and therefore the most economical; and, further, that it shall be such as will admit without detriment of that expansion which the future will certainly require. Upon an accurate perception of the best treatment of the site the economy of the creation of the city will largely depend; and it is but proper that one should desire to have as perfect a result as possible for any given expenditure.

"The grouping of activities having many points of contact, or common features, and the locating of one or more groups round a suitable point, as round a radial-centre, is so obviously desirable as to need no advocacy; and when a city can be designed without the embarrassments created by pre-existing occupation, there can be nothing to prevent such grouping in any form conceived to be desirable. Thus the housing of Parliament and of the great departments of official administration might very properly be grouped around one centre, those having most frequent need of intercommunication being the nearest together; a university and its affiliated colleges might create another centre, technical and high schools still another, an aggregation of great commercial institutions yet another, and so on. Then, again, the industrial occupations which would develop might with advantage be relegated to one quarter of the city, the large commercial houses to another, while its environs would normally constitute the residential sites, variously disposed according to the classes of residence allowed to be erected. The study in the original design should embrace all possibilities of extension for even remote periods, so far, at any rate, as they can be foreseen; and the control of settlement should also be sufficient to insure the possibility of ultimate conformation to the first ideal, even if for any sufficient reasons it be temporarily abandoned.

"When it is considered that the importance of securing the full advantage of shortness in path of travel from point to point diminishes as the total amount of traffic in any street diminishes, it will be realised that as long as the radial system is sufficiently employed for reducing the distance from all parts to the principal centres, and for bringing into prominence such æsthetic features as great public buildings and monuments, the substantial benefits of the system will have been secured. The adoption, then, of the rectangular system for the balance of the design, modified only under the compulsion of meeting topographical difficulties, will admit of the advantages of that system being also fully exploited."

Discussing the important question of the width of streets, Mr. Knibbs said:—

"It is evident at once, not only that the streets should as a whole be somewhat narrower both in the intense business centres and in the less important parts of the city and its suburbs, but also that the general character of the city must affect the question. Therefore, in a capital city the æsthetic requirements are rightly regarded as of commanding importance, and utilitarian considerations as secondary, and properly subordinated to the last possible degree consistent with the fact that the general arrangements must of course be really practicable ones. Speaking broadly, the towns of the Commonwealth have been designed with small regard to æsthetic features, and the idea of avenues constituting an ordinary feature is practically foreign to us, though not absolutely so. The magnificent example, however, of Paris suggests the propriety of the greater radial lines from the chief centres, forming boulevards.

"Coming to actual dimensions, it may be said that lanes or streets of less width than, say, 10 metres, or 33 feet ($\frac{1}{3}$ chain), are extremely undesirable. Unimportant roads and streets, so situated that they can never become of importance, might be designed with widths of from 20 to 25 metres, or, say, from 66 to about 80 feet. Roads and streets of moderate importance, likely to require tramways, cycle paths, central footpaths, and so on, might be of still greater width, viz. of from 30 to 40 metres, or, say, of from 100 to 130 feet; while still wider streets, set out with avenues of trees, flower-beds, &c., might

have any width of from 50 to 75 metres, or, say, from 160 to 240 feet.

"With a suitable restriction as to height of buildings, such widths as have been suggested will not present any difficulties as to quantity of light, or as to suitable approach in cases of fire, while the abundant access of sunlight and the sufficiency of room for the planting of trees in the streets makes it possible to insure in the highest degree the fulfilling of the requirements of hygiene."

As to the size of blocks between streets, Mr. Knibbs suggests the following dimensions:—Public institutions, large factories and large establishments generally, 100 by 200 metres; large suburban residences with grounds, 80 by 160; larger business sites, city residences, &c., 60 by 120-160; smaller establishments, 40 by 80, 30 by 60-90, 20 by 60; workmen's dwellings, 10 by 30. If smaller areas than these last are admitted the elements of hygiene and beauty must be correspondingly sacrificed. The length of blocks may vary between, say, 100 to 200 metres, or, say, between 330 and 660 feet, and rear lanes be from 10 to 15 metres in width, say, 33 to 50 feet.

As to the height of buildings, he lays it down that, "as a maximum limit, the façade of any building abutting on the street should not be greater than the width of the street it faces. All conspicuous or prominent sites should be appropriated for great public buildings and monuments upon which a people may be expected to lavish its wealth and artistically express its national feeling.

"Outside the æsthetics of architecture proper, the designer requires moreover to consider in general the picturesque effect of masses of foliage, the perspective appearance of monumental buildings and monuments from the points of view where they will be prominently seen, the grouping of buildings and classes of buildings, the effective position for parks, gardens, &c., the special provision necessary for the proper viewing of all features of interest, and so on; for it is by attention to such elements of city design that the possibility of beauty is created, and the picturesque capabilities of a site are exploited. Thus eminences and concave surfaces, both of which should lend themselves to striking effects, should be exhaustively studied in relation to the general scheme.

"Imperfect as is the statement given of the elements to be considered in any real attempt to properly design an important city," says Mr. Knibbs in conclusion, "it will nevertheless be sufficient to indicate that a preliminary topographical and contour survey of the whole of the site is an essential. Such a plan perfectly represents the surface, and if supplemented with such geological information as to the depth at which rock is found, the nature of the rock and of the material from the surface down thereto, it would constitute the necessary prerequisite for thoroughly discussing the design. Obvious as this seems (and it must be equally evident that even in regard to the engineering details alone the cost of obtaining such information would be far more than compensated by the aid it would lend to economy of construction), it has not been the practice in the Australian States to obtain it. The time lost in so doing is gained in the end, and it is only by such systematic procedure that satisfactory results could be achieved. I am well aware that those who have not thoroughly studied this question are under the impression that what is called the common sense of well-educated people is sufficient for the task of designing. That is not the opinion of those who have seriously given the matter their professional attention. If evidence were wanted of the calamity of indifferent design, it is to be had in our own city and suburbs. The topographical features of Sydney would have permitted it to be, if not the most, at least one of the most beautiful cities of the world. No word-painting could too vividly or with too high a colour express the magnificent opportunity that once existed for the people of this land to create a city of almost unparalleled beauty; that opportunity has been hopelessly lost through the ignorance and want of appreciation of those whose duty it was to avail themselves of it, leaving at the same time a monument of the dignity of their ideas. And the reason of failure is that no great scheme for the creation of the city was ever heartily entertained. Like Topsy, it has 'grewed.' And any other city that grows by chance will equally exhibit great imperfections, and fail of its possibilities."

STEPNEY CHURCH.

FROM the first accounts which appeared of the fire at St. Dunstan's Church, Stepney, it was supposed that the building was destroyed. The Rev. A. E. Dalton, the rector, describes the extent of the damage in the following plain statement:—

So many are interested in this ancient church that I am sure you will allow me to state exactly what has happened. The church is not burnt down; the energy of Commander Wells and the efforts of our excellent Fire Brigade have saved us

from that, though the fire, the origin of which is unknown, had obtained a strong hold before it was discovered. Our loss, briefly, is that of the roof of chancel and nave, the organ, and vestries and chapter-house, with their contents. Of this, our beautiful fifteenth-century roof, the seventeenth-century organ front, and the old prints and map in the vestry are irreplaceable. But the plate and registers are intact, while the tower and the whole of the interior, *i.e.* walls, with monuments, seats, &c., are practically unhurt.

I see it stated that we are insured for 11,000*l.*, and that this will cover all damage. The first statement is true, I wish the second were, for while 11,000*l.* would more than cover all damage, much of that sum is unavailable—*e.g.* insurance on tower, seats, plate, &c.—and I am already learning that there are many expenses which insurance cannot cover. A considerable sum, possibly some 2,000*l.*, will be required over and above the insurance. Such a demand comes at a terribly awkward time. Less than two years ago 5,600*l.* was spent on the church, and only a month ago we commenced the completion of our second church, St. Faith's, for which 1,800*l.* are still required. The ordinary working expenses of such a parish as this, with its population of 24,000, in the heart of the East End, always taxes our resources to the very uttermost.

I can therefore confidently appeal to the generosity of the public not to allow this fresh and unexpected burden to weigh down those who already have their hands full and their pockets empty. The Bishops of London and Stepney authorise me to state that this appeal has their cordial support.

The church of St. Dunstan, the "mother church" of the East End, is an ancient and most interesting building. It was built in the year 960 by Archbishop Dunstan on the site of an earlier church, and was at the time dedicated, it is supposed, to All Saints. Later on, when Dunstan became canonised, the church was dedicated to its builder. In 1485 the church was rebuilt, the fine old oak roof now destroyed dating to that time. The only parts of the present church which date back to before that rebuilding are the sedilia and an old stone crucifix, but these probably were not made earlier than the twelfth century.

The church contains many interesting monuments, which have fortunately been preserved. The most famous is that of Sir Henry Colet, Lord Mayor of London in 1486 and 1491, and father of Dean Colet, founder of St. Paul's School. The monument to Sir Thomas Spert, Comptroller to the Navy of Henry VIII., and founder of the Trinity House, which is on the south wall of the chancel, was erected in 1622, eighty years after his death, and replaced in 1725 and 1806, at the expense of the Elder Brethren of the Trinity. Another famous tomb is the "Fish and Ring" monument on the west wall. It is really to a Dame Rebecca Berry, but owing to the fact that a fish and a ring occur in the arms, a tradition grew up that she was the heroine of the ballad of the "Cruel Knight and the Fortunate Farmer's Daughter." In this the knight, to defeat a prediction that he would marry a damsel of low birth, swore that he would never see her until she brought back his ring, and to prevent her doing so cast the ring into the sea. The damsel became a cook, and cutting up a fish one day found the ring. Then they married and lived happily ever after. Here, too, were buried Sir John Leake, Queen Anne's admiral, who twice relieved Gibraltar; Matthew Mead, the Puritan divine, who was ejected by the Act of Uniformity in 1662; Benjamin Kenton, who began life as a pauper and died a wealthy vintner in Aldgate; and a great company of lords and ladies, officers of the horse guards, "admirals of the Irish seas," captains of East Indiamen and mariners generally. One inscription in the churchyard is quaint:—"To the memory of Betsey Harris, who died suddenly while contemplating the beauties of the moon, April 24, 1831, in her twenty-third year."

ARCHITECT'S FEES.

A CASE was heard before the Recorder of London in which Mr. Edward Gabriel, architect, Old Broad Street, sued Mr. Elliott for the sum of 18*l.* 18*s.* for work done. The defendant had an option to build premises on a plot of land in Rosebery Avenue. He gave instructions to the plaintiff to inspect the site, and to see what building could be placed there without interfering with certain ancient lights. The land was inspected. After that had been done and information obtained from the Northampton Estate office, the defendant wished plans to be prepared and the matter pressed forward. The plans were sent to the defendant through a Mr. Tasker. Mr. Tasker said that he was acquainted with the defendant, and knew of his (defendant's) option to build on the plot of land. He advised the defendant to employ an architect, and the plaintiff was introduced through him. The defence was that no instructions were given to the plaintiff to prepare the plans. If plans were necessary it was arranged that there should be no charge until he (defendant) had actually obtained possession of the land. At the same time he (defendant) was

negotiating with a Mr. Reason for other premises, and the matter of the plot of land in Rosebery Avenue was only to be gone on with in the event of the negotiations with Reason falling through. Those negotiations did not fall through. The jury eventually returned a verdict for the plaintiff for the amount claimed.

THE INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have in addition to the medals and prizes given for communications discussed at the meetings of the Institution in the last session, made the following awards in respect of other papers dealt with in 1900-1:—A Telford medal and a Telford premium to Reginald Pelham Bolton (New York); a Watt medal and a Telford premium to J. Emerson Dowson (London); a George Stephenson medal and a Telford premium to W. T. C. Beckett (Calcutta); a Manby premium to E. K. Scott (London); a Trevithick premium to T. A. Hearson, R.N. (London); a Telford premium to J. A. W. Peacock (Tantah, Lower Egypt). For students' papers the awards are:—A Miller scholarship (tenable for three years) and the "James Forrest" medal to E. V. Clark, B.Sc. (London); Miller prizes to C. E. Inglis, B.A. (London), H. E. Wimperis, B.A. (Cambridge), J. L. Cridlan (London), F. K. Peach (London), G. H. Whigham (Glasgow), F. Taylor, B.A. (Manchester), A. C. Walsh (Newcastle-on-Tyne), and H. O. Jones (Manchester).

TESSERÆ.

Urbanity in Architecture.

A BUILDING devoid of architecture displeases all who see it—all whose share of heaven's light is intercepted, whose view of the fair earth is bounded by it, because they see and feel that it benefits its owner at their expense—they have not been thought of in the design—it is all for self, without appearing to care whether they are incommoded or not, or to know that there are eyes without as well as within. It is this crude, selfish rudeness which requires to be softened down by a politeness either natural or acquired, and this politeness we term architecture. It is only one portion indeed of the aim of "architecture proper," but it is the most indispensable portion, without which all attempts at the higher aims of beauty, sublimity or definite expression will be totally useless. The building that aims at being anything more than useful and strong must first be polite. This is the lowest quality in architecture as distinguished from building. Some seem to allow the term architecture only to acquired politeness in building, but it ought to be applied quite as much if not more to that which is natural; indeed, they so merge in one another that it would be impossible to draw the line between them. It must be observed that the structures of savage nations always exhibit this natural politeness. Let them be ever so rude in construction or in decoration or in both, they are never rude in expression, never do they seem made for self alone like the oyster, shut up in the narrowness of its shell, pushing forth excrescences wherever its internal purposes suggest without appearing to know that there is a world outside. On the contrary, the rudest of these huts present on their exterior some evidence of unnecessary design, some regularity or symmetry not required by their internal purposes, and this stamps them as architecture. It shows an aim beyond convenience and stability; it shows the spectator that he, even he, has been cared for as well as the owner, and the structure belongs not altogether to a man, but in some sort also to humanity. As in the models from which these children of nature learnt their art there is nothing made for itself, and from the world-sustaining sun down to the little busy world-enlarging coral-line nothing appears to belong to itself with the sole exception of the oyster above-mentioned—a marvellous anomaly which may possibly be required to complete nature's great system of symbol-teaching; her universal language, which without this would have no word of selfishness.

Isaac Fuller, the Painter.

It is said of Fuller by Graham that "he wanted the regular improvements of travel to consider the antiques, and understood the anatomic part of painting, perhaps equal to Michel Angelo; following it so close that he was very apt to make the muscleging too strong and prominent." But this writer was not aware that the very fault he objects to in Fuller did not proceed from not having seen the antiquities, but from having seen them too partially; and that he was only to be compared to Michel Angelo from a similitude of errors, flowing from a similitude of study. Each caught the robust style from ancient statuary without attaining its graces. If Graham had avoided hyperbole he had not fallen into a blunder. In his historic compositions Fuller is a wretched painter; his colouring was

raw and unnatural, and not compensated by disposition or invention. In portraits his pencil was bold, strong and masterly; men who shine in the latter and miscarry in the former want imagination. They succeed only in what they see. Graham speaks of Fuller as extravagant and burlesque in his manners, and says that they influenced the style of his works. The former character seems more true than the latter. His own portrait in the gallery at Oxford is capricious, but touched with great force and character. His altarpieces at Magdalen—which Addison praised in a Latin poem—and All Souls Colleges in Oxford were despicable. At Wadham College was an altar-cloth in a singular manner, and of merit; it was just brushed over for the lights and shades, and the colours melted in with a hot iron. He painted the inside of St. Mary Abchurch in Cannon Street. While Fuller was at Oxford he drew several portraits, and copied Dobson's *Decollation of St. John*, but varying the faces from real persons. For Herodias, who held the charger, he painted his own mistress, her mother for the old woman receiving the head in a bag, and the ruffian who cut it off was a noted bruiser of that age. There was besides a little boy with a torch, which illuminated the whole picture. Fuller received 60 pieces for it. In King James's catalogue is mentioned a picture by him, representing Fame and Honour treading down Envy. Colonel Seymour had a head of Pierce, the carver, by Fuller. He was much employed to paint the great taverns in London, particularly the Mitre in Fenchurch Street, where he adorned all the sides of a great room in panels, as was then the fashion. The figures were as large as life; a Venus, Satyr and sleeping Cupid, a boy riding a goat and another falling down over the chimney; this was the best part of the performance, says Vertue. Saturn devouring a child, Mercury, Minerva, Diana, Apollo; and Bacchus, Venus and Ceres embracing; a young Silenus falling down and holding a goblet, into which a boy was pouring wine; the Seasons between the windows, and on the ceiling two angels supporting a mitre, in a large circle; this part was very bad, and the colouring of the Saturn too raw, and his figure too muscular. He painted five very large pictures, the history of the king's escape after the Battle of Worcester; they cost a great sum, but were little esteemed. Vertue had seen two books with etchings by Fuller; the first, Caesar Ripa's "Emblems," some of the plates by Fuller, others by Henry Cooke and Tempesta. The second was called "Libro da Disegnare"; eight or ten of the plates by the painter. He died in Bloomsbury Square, July 17, 1672.

Aphorisms on Art.

Spirit alone gives life; but spirit becomes unsubstantial when it does not submit to laws and rules. Everything great and beautiful rests on the harmonious co-operation of three agents: knowledge, will and power. The brilliancy of our modern works of art generally serves only to light up their inward emptiness. A man that stands on a giant's shoulders is very apt to think himself the taller of the two. Never perhaps was genuine art so much needed as in our overworked and pretentious times. But art must penetrate all the elements of life and not seek to be valued as a separate thing. In the Middle Ages the ideal ruled, and under her influence the sensible as the highest and lowest authority. At present intellect has denied the existence of the former because she could neither be weighed, counted nor handled, and pronounced the sensible tributary to himself. As the Creator has clothed man with beauty, so should man also impress the stamp of his higher nature on what he produces, for that which is merely useful cannot satisfy it.

Domenico del Ghirlandaio.

Ghirlandaio, born in 1449, was the son of Tommaso de' Bigordi, a broker of Florence. Domenico was apprenticed to a goldsmith, as were also his younger brothers, David and Benedetto. Hence the appellation "del Ghirlandaio" (in the Florentine dialect Grillandaio), which became common to the brothers after they adopted painting, and was perpetuated in their descendants. In Florence in the fourteenth and fifteenth centuries a goldsmith—*orafo*, or *orefice*—was often more familiarly termed *ghirlandaio*, as one of his chief occupations was the manufacture of those rich coronals (*ghirlande*) then in favour with the unmarried and newly-wedded ladies of that city. Vasari, accepting the quasi patronymic form of the term in a sense too direct, supposed that Tommaso Bigordi was himself the goldsmith from whom the sons derived it. This error of the biographer has been exposed by the discovery of documents in the Florentine archives. After a time Domenico abandoned the pursuit for which he had been destined and studied painting under the direction, as is said, of Alesso Baldovinetti. However he may have learnt that art, he rose amidst the great influences around him to be one of its most eminent representatives. The Renaissance movement was then in full swing in Florence, and one of its signs was the gradual development of a healthy realism in art. Even in the preceding century portraiture had made its way into religious

art, though at first timidly and in humble guise. Proud rulers, spiritual or temporal, appeared only as devout suppliants (often of pigmy size) before the divine and sainted personages whose grace or intercession they invoked. But as the scope of art widened, perhaps too as devotional awe awakened, the donors and their families gradually assumed a part in the scene, either as reverent spectators or as subordinate actors. This innovation, to which Masaccio greatly helped to pave the way, was further developed by Ghirlandaio, who thus, at the instance of his patrons and of his own good-will, filled out many of his great fresco compositions with portraits of eminent men and beautiful women of Florence, enframed his groups in the graceful domestic architecture of the time, and so in subjects taken from sacred story has left us an exalted picture of life as it presented itself to him in his day.

Oddities of Feudal Homage.

Some of the antique forms of paying homage to a feudal superior were very comic. In one of the lordships of France the peasants were obliged to bring a canary bird to the château, placed on the top of a carriage drawn by four horses. In Austria a noble vassal was to present every St. Martin's Day to his superior two pots of flies. Another nobleman in Franconia offered to his lord as a mark of homage a grass-hopper. When the Abbot of Figeac made his entrance into the city of his abbacy, the Lord of Montbrun and Larogue received him dressed as an harlequin, with one leg bare. When the abbot descended from his horse the same person held his stirrup, and when he sat down to table waited behind his chair to fill his cup with wine. The Lord of Pacé had a right to summon all the pretty women of Saumur and its suburbs every Trinity Day before him, and they were to pay him each four farthings and a chaplet of roses. Those who refused to dance with his officers were to have the family arms marked on their bodies with the point of a needle. In Provence buffoons, dancers, mimics and minstrels were to perform their tricks and show their skill before the lady of the château. A troubadour was obliged to sing his romance to a new air to be entitled to pass a night in the manor house. Any pedestrian, with or without shoes, might claim a lodging by making four somersaults; a Moor might enjoy the same privilege by throwing his turban in the air, and counting 6 sous whilst he stumbled and fell down to the gate porter; and a Jew had free entrance and hospitality by putting his shoes on his head and repeating, *bon gré mal gré*, the pater in the patois of the country. A horseman was obliged to watch his arms half the night for the service of the châtelaine, and the conductor of animals to a fair was in duty bound to stop before the château and make his monkeys play their tricks and his bear dance to his flute before he could proceed any further. By a law of St. Louis, jugglers and bear-wards and ape-leaders were exempted from paying any custom duties on entering cities, on the condition that they amused the gate porters by the performances of their animals or sleights-of-hand. The jugglers, however, might be quit with a song.

GLASGOW ARCHITECTURAL ASSOCIATION.

A MEETING of the Glasgow Architectural Association was held at Glasgow on Oct. 15. The president (Mr. Chas. E. Whitelaw) occupied the chair, the lecture for the evening being "Scottish Domestic Architecture of the Seventeenth Century," by Mr. Alex. N. Paterson, M.A., A.R.I.B.A., the lantern slides being from the collection of Mr. John Fleming. Mr. Paterson in his opening remarks said great credit was due to Mr. Fleming, who, although not a member of the profession, took a great interest in the Scottish architecture of this period and had during his travels made an excellent collection of photographs. Before going over the slides Mr. Paterson gave a synopsis of the growth of Scottish architecture. He then went on making copious comments on each of the slides, examples of work about that period from parts of Scotland being illustrated. At the close of the lecture Mr. Wm. J. Blain moved a vote of thanks, expressing the appreciation of the Association for their (Messrs. Paterson and Fleming) combined efforts in producing such an interesting and educational lecture. In seconding, Mr. James Lochhead said the Association had made, from an education in Scottish architecture point of view, a bright start for the session, opening with a paper on "Ecclesiastical Scottish Work" and following it with Mr. Paterson's paper. The President, in officially tendering the thanks of the Association to Messrs. Paterson and Fleming, drew the attention of the members to the election of house committees. Mr. Thomas Ramsay was appointed in place of Mr. Hugh Dale, who retires. The house committee for session are Messrs. Chas. E. Whitelaw, Wm. J. Blain and Thos. Ramsay. In closing the meeting, the President made some remarks upon the prize scheme for November and the annual exhibition.

BARNARD CASTLE.

UNDER the direction of Lord Barnard, a number of masons are engaged in repairing Baliol's Tower, the dungeon of Brackenbury, and other ruins of the fortress built at Barnard Castle in 1112-32 by Bernard Baliol. The work of restoration now going on is supplementary to repairs directed by the lord of the manor a year or two ago, which have been the means of rescuing some portions of the ancient fabric from utter demolition. Once amongst the most important and extensive fortresses in the North of England, it originally commanded one of the principal highways between Durham and Yorkshire. In 1569 the castle underwent its memorable siege, and in 1629 it was sold to Sir Henry Vane, from whom it descended to Lord Barnard. A small oriel window overlooking the Tees bears the "boar" of Richard III, and corroborates the tradition of his residence here as Duke of Gloucester, to overawe the Lancastrians. Baliol's Tower, which is 150 feet above the ruin, is receiving careful attention.

The Sad Case of Sir Simon Leach—His Monument.

SIR,—The remote village of Cadeleigh, not far from Tiverton, in Devon, possesses an interesting village church, the crowning glory of which is a magnificent Jacobean monument with life-size sculptured figures, surmounted by a heavy canopy, a most complete and handsome example of the gorgeous Renaissance period. The monument was erected by Sir Simon Leach, a quondam sheriff of the county, to commemorate himself and his descendants, and in order to keep his memory green he left also a sum of money to keep the monument in repair. Ill fortune, however, attended the family, and it is now, I believe, quite extinct in the direct line. The family mansion is a humble farmhouse, and the money that was left to keep the tomb in repair, although invested in land, has been allowed to lapse for the incredible reason that no trouble was taken to collect the rent in the sleepy meridian of the last century.

When I saw the tomb a few weeks ago it was doomed to destruction. The canopy was falling backwards and was endangering the fabric of the church, and in a fortnight for safety's sake was to have been removed. For the time being the parish authorities are holding their hands, while I am doing my best to arouse interest in what is the finest example of the period in Devonshire. The tomb commemorates a Devon worthy, and it will be a standing reproach if it be destroyed, or allowed to be removed from the church in which he worshipped, and in which he desired to rest with his wife and children.

The cost of underpinning and preserving the monument will be only 80*l*, of which about 25*l*. has been promised. The parish is very poor and the population small. May I appeal through you to the many lovers of the ancient and picturesque relics of our country for help in the work of preservation.

It is not desired to restore, only preserve. Many Devonians in London will, I am sure, send a small subscription for the sake of the old county. The most trifling sum will be gratefully received by Miss Chichester, Calverleigh Court, Tiverton, or by yours very obediently,

PRESCOTT ROW.

The Offices of the Homeland Association,
St. Bride's House, 24 Bride Lane,
Fleet Street, E.C. 4.
October 16, 1901.

GENERAL.

The King has given permission to Mr. Augustus Zarb that he may accept and wear the insignia of the Fifth Class of the Imperial Order of the Medjidieh, conferred upon him by His Highness the Khedive of Egypt, authorised by His Imperial Majesty the Sultan of Turkey, in recognition of valuable services rendered to His Highness by Mr. Zarb as assistant to the architect of the Khedivial palaces.

His Majesty the King has been graciously pleased to accept artist's proofs of Mr. Axel Hermann Haig's new etchings of Windsor Castle and Buckingham Palace.

Mr. William Scott, architect, has received authority from the King that he may wear the Cross of Knight of the Crown of Italy, conferred upon him by His Majesty the King of Italy in recognition of services rendered by him to Italian history and art.

At the Last Meeting of the London County Council it was stated that the contract for the granite for the pedestal of the

Boadicea group was made many months ago with the Bude quarries, but owing to a strike there the stone was sent to Aberdeen to be worked. It was placed in position, and was then condemned by the Council's architect. More stone was obtained and sent north, and that again was condemned by the architect. The works committee then procured some stone in London, which was now being fixed.

The Amended Plans of a new variety theatre to be erected in Newcastle have been approved by the licensing magistrates. The designs are the work of Messrs. Wylson & Long, London.

The London County Council are to hold a conference with Mr. Akers Douglas, in order to obtain his consent that the widening of Piccadilly to be proceeded with.

M. Eugène Berthelon's painting, *Bords de la Seine à l'Île de Saint-Denis*, has been cut from its frame in the Paris Hôtel de Ville and stolen. Owing apparently to the haste with which the canvas was cut out, the thief omitted to include the painter's signature, which remains in the corner of the frame.

The Royal Society of British Artists on Monday last elected the following members:—Messrs. Beale Adams, J. Paul Brinson, W. Houson Byles, Moulton Fowleraker, A. Henderson, Hely Smith, Miller Smith and W. H. Spittle.

The Housing Committee of the Bermondsey Borough Council are considering a proposal to purchase 7,260 square yards of land adjoining Southwark Park Road for about 20,000*l*. as a site for municipal dwellings for artisans. The site is about to be vacated by a firm of engineers, and the surveyor has planned accommodation for 400 rooms, being forty sets of three rooms and 140 sets of two rooms.

A Course of Six Lectures on the Renaissance in Italy has been commenced in Horsham in connection with the Oxford University Extension. The lecturer is Mr. E. L. S. Horsburgh, M.A., ex-president of the Oxford Union and staff lecturer in history and literature.

The City Council of St. Petersburg have arranged a competition for two bridges over the Great Neva and their approaches.

Mr. W. Emden is preparing the designs for the large terminus at Brighton for the proposed electric railway between that town and London. The terminus will have a frontage on Furze Hill. The whole scheme is estimated to cost between six and seven millions. The consulting engineers are Mr. B. Leslie and Mr. A. J. Barry, late partners with Sir John Wolfe Barry.

A Memorial of Heine, the poet, has been completed in Vienna. The sculptor is Herr Hasselries, and the work is executed in Carrara marble.

Mr. J. P. Briggs is the architect of the new opera house and business premises which are to be erected at Tunbridge Wells, at a cost of 30,000*l*.

The Australian Commonwealth Government recently offered a prize for the best design for a federal or national Australian flag. No fewer than 30,000 designs were sent in. The Exhibition Building in Melbourne was used by the judges to examine and display the flags. The prize of 150*l*. was divided among five competitors, who designed almost identical flags.

Professor W. H. Wagstaff delivered on Tuesday at Gresham College the first of a course of four lectures on "Trigonometrical Surveying."

A New Organ Case and Screen of carved oak, executed by Messrs. Thompson Bros., of Peterborough, from designs by the late Sir Arthur Blomfield, has been erected in Kingston Church, Hants, at a cost of 1,000*l*.

The First Ordinary Meeting of the Liverpool Architectural Society will be held at 6 P.M. on Monday next, the 21st inst., in the Society's rooms, 41 Castle Street, Liverpool, when a paper will be read by Mr. Fletcher T. Turton on "Cheap Dwellings."

The Committee of Management of the North London Hospital for Consumption having asked five well-known hospital architects to compete for the erection of their proposed country branch and convalescent home at Northwood, Middlesex, have selected the design submitted by Mr. Frederick Wheeler, F.R.I.B.A., of 6 Staple Inn, W.C.

Mr. A. H. Ryan-Tenison, A.R.I.B.A., has removed his offices to 12 Little College Street, Westminster, S.W.

Messrs. Briggs & Wolstenholme (F. B. Hobbs & Arnold Thornely) announce that they have removed from 14 Castle Street to May Buildings, 51 North John Street, Liverpool.

The Dedication of a new Presbyterian church, which has been erected in Henry Street, Limerick, took place on the 3rd inst. The new church, which is one of the handsomest in the city, has been erected by Messrs. John Ryan & Sons, builders, from the plans of the architect, Mr. G. C. Ashlin, Dublin. The cost is estimated at about 6,000*l*.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

VOLUME LXV. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered. Price 1s.

WALES.—Oct. 24.—For strengthening the walls of the Carnarvon Guildhall with channel irons, &c., and the erecting thereon of a framed steel girder foundation and clock tower. Mr. Edward Hall, borough surveyor and engineer, Guildhall, Carnarvon.

WALES.—Oct. 25.—For alterations to Carmel Methodist chapel, Aberavon. Mr. G. P. Davies, architect, Station Road, Port Talbot.

WALES.—Oct. 28.—For erection of a farmhouse near Stalling Downs, Cowbridge. Mr. Daniel Evans, architect, Eastbourne House, Cowbridge.

WALES.—Oct. 28.—For erection of schools at Brynteg, near Wrexham, and also for alterations and additions to existing schools. Mr. R. J. Kendrick, clerk to Broughton School Board, 1 Henblas Street, Wrexham.

WALES.—Oct. 29.—For taking-down and rebuilding chimney-stacks on old infirmary, Griffithstown, Pontypool. Mr. T. Watkins, clerk, Union Offices, Pontypool.

WALES.—Nov. 1.—For erection of laboratory and fittings at the county school, Cardigan. Mr. James Stephens, clerk, 3 Green Street, Cardigan.

WARRINGTON.—Oct. 24.—For reconstruction of an existing filter-bed, the conversion of the existing service reservoir into two filter-beds, and the construction of a covered service reservoir, approach roadway and culvert, stream diversion, drains, waterman's cottage and boundary walls, an outfall sewer from the village of Hatton, &c. Mr. James Deas, engineer, Municipal Offices, Warrington.

WEST KENSINGTON.—Oct. 29.—For erection of a sub-district post office. Copy of the conditions and form of contract may be seen on application to Mr. Henry Tanner, H.M. Office of Works.

WESTMINSTER, S.W.—Nov. 12.—For erection of public offices at Westminster, for the Commissioners of H.M. Works and Public Buildings. Conditions and form of contract may be seen on application at H.M. Office of Works, &c, Storey's Gate, S.W.

WHITLEY.—Oct. 26.—For erection of business premises, Whitley, Northumberland, for the North Shields Industrial Society, Ltd. Messrs. Hope & Maxwell, architects, Saville Street, North Shields.

WILLENHALL.—Oct. 28.—For erection of a disinfecting station at the sewage outfall works, Willenhall, Staffs. Mr. T. Edgar Fellows, surveyor, Town Hall, Willenhall.

WILLESDEN.—Oct. 22.—For additions to hospital for infectious diseases. Mr. O. Claude Robson, engineer, Public Offices, Dyne Road, Kilburn, N.W.

WIMBLEDON.—Nov. 20.—For construction of new concrete sewage precipitation, sludge and storm-water tanks, sludge pumps, cast-iron mains, valves, floating arms, penstocks, &c., at the sewage works, Durnsford Road. Particulars may be obtained at the Council Offices, Broadway, Wimbledon.

WOLVERHAMPTON.—Oct. 22.—For stripping and reroofing of the art gallery in Lichfield Street. Particulars may be obtained on application at the borough engineer's office.

YORK.—Oct. 25.—For enlargement of the head post office, York. Conditions and form of contract may be seen on application to the Postmaster at York.

THE NATIONAL REGISTRATION OF PLUMBERS.

THE Mayor of Derby in presenting certificates of registration to several master and operative plumbers at the Guild Hall, Derby, on Saturday last, said that the objects of the National Registration of Plumbers were such as to commend themselves to every thoughtful person. For some years the organisation had been seeking powers in Parliament to legalise the present voluntary system of registration to enable those employing plumbers to be satisfied that they were employing thoroughly efficient workmen. These objects appeared to him to be thoroughly laudable, and he sincerely hoped that they would be achieved. As the health of the people depended so much upon the plumbers, it was obviously necessary that the work should be carried out by competent and practical men.

Alderman Richard Hind, mayor of Stockton-on-Tees and renter warden of the Plumbers' Company, referred to the work of the organisation, particularly with regard to the technical education of young plumbers. The object was to get more carefully educated and well-trained workmen through the medium of the technical classes.

Sir Thomas Rowe, M.P., in expressing his sympathy with the objects stated that he had been closely connected with the building trade all his life, and was fully alive to the importance of plumbingwork as affecting public health. He was entirely in sympathy with the Plumbers' Registration Bill, and would support the measure on all occasions.

MAY-OATWAY FIRE ALARM
Simple, Inexpensive, and Reliable.
Used by H.M. Postmaster-General.

Residences some distance from fire brigades when they usually burn themselves out. This is prevented by pumps and extinguishers are sometimes cut off if fire is discovered. The May-Oatway Fire Alarm discovers in time to prevent loss or fatal consequences. On the fire, calls the nearest Fire Brigade, as well as lodgekeepers, stablemen and all helpers, and at the exact seat, extent and course of the fire usually, without human assistance, and whether the premises occupied or not. Architects and builders invited.

M. SHAW (late London Fire Brigade), Chairman.
F. FREECE, Consulting Electrical Engineer.

TRADE NOTES.

WE have pleasure in announcing that Messrs. George Jennings, Ltd., of Lambeth Palace Road, have received the appointment of sanitary engineers to H.M. the King.

MR. E. E. LOGSDON, for many years manager to Messrs. J. Jones & Sons, has commenced business as a heating engineer at 34 Rosebery Avenue, London, E.C.

WE have been asked to state that the whole of the floor in connection with the new Wesleyan chapel at Wolverhampton referred to in our last issue, was laid with the patent wood block flooring supplied by Mr. Roger L. Lowe, of Farnworth.

THE Town Hall, Keswick, has lately been fitted by Messrs. John King, Ltd., engineers, Liverpool, with their well-known "Small Tube" hot-water heating apparatus, and also their patent tubular exhaust ventilators.

A LARGE clock was started at Heeley Church, Sheffield, by the Master Cutler on Saturday, October 12. The clock strikes the hours, shows time on two dials each 5 feet 6 inches across, and has been generally made to Lord Grimthorpe's designs by John Smith & Sons, Midland Clock Works, Derby.

MESSRS. DIESPEKER & CO., of 57-60 Holborn Viaduct, inform us that they laid a great quantity of their mosaic paving at the St. Pancras Baths, to the opening of which we referred last week. This paving was, we understand, chosen by the architects from among those of a great number of other competitors, and not only has it been laid in the entrances and corridors, &c., but in the bath-ponds and gangways.

MESSRS. D. BROWN AND JOHN CHALMERS, trustees of the late Mr. Thos. Chalmers, started the new clock presented to the Town Hall, Annan, Dumfries, on the 10th inst. The clock shows the time upon four external illuminated dials, 5 feet 6 inches each in diameter, and strikes the hours on a large bell. There are automatic apparatus for turning on and off the lights, Lord Grimthorpe's gravity escapement and other improvements. The clock was made and fixed by Messrs. Wm. Potts & Sons, clock manufacturers, Town Hall Buildings, Newcastle-on-Tyne, and Guildford Street, Leeds.

THE "Robertson Sunshine" lamp for electric lighting is a new bulb introduced by the General Electric Company, Ltd., which has been specially designed to meet the requirements of those consulting engineers and local authorities who are taking up the now well-recognised system of lighting streets with incandescent electric lamps. It has a detachable opal glass

THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE

"PREMIER"
SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

NO OUTSIDE PAINTING REQUIRED.

PERFECTLY DUSTPROOF.

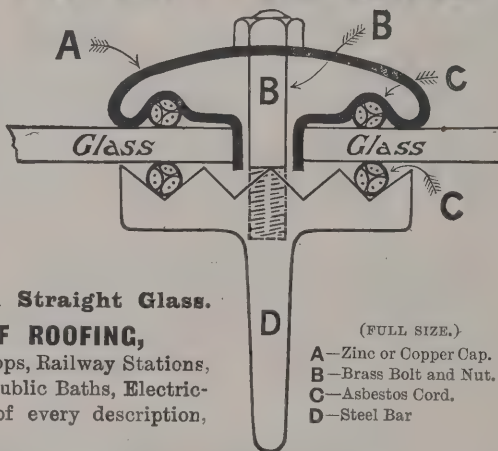

Wherever adopted saves 95 per cent. in maintenance.

Curved Roofs can be Glazed with Straight Glass.

SUITABLE FOR ALL KINDS OF ROOFING,

Such as Weaving Sheds, Engineering Workshops, Railway Stations, Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description,

&c. &c.

This System allows for full expansion and contraction of glass and absorbs any vibration from machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

reflector, by which a great saving is effected, and two short rigid filaments in series for 200 to 250 volt supplies. The lighting of side streets by means of incandescent lamps is becoming more and more frequent, and in the majority of cases where the authorities prefer to adapt the present gas lamp-post, something is wanted to throw the light clearly in both directions. The "Robertson" lamp seems to fulfil this purpose very effectively if two are used. The lamp is specially made to stand vibration.

THE Clamond gas radiator is a new heating apparatus now being introduced by the Kern Burner Company, Ltd. The principle of this radiator is the application of the well known Kern incandescent gas-light burner system to gas fires, which, it is claimed, solves the problem of heating by gas without vitiating the atmosphere. The proportions of air and gas have been carefully worked out so as to arrive at exactly that mixture which has been found to produce almost perfect combustion, at the same time giving a powerful radiant heat. The Clamond gas radiator is designed either to fix in the ordinary coal fire-grate or is supplied fitted in ornamental stove casings to be connected with the chimney-flue. It is supplied in a variety of sizes and patterns, and also in a form suitable for use with gas stoves of other makers.

MESSRS. OETZMANN & CO. ask us to mention that, having purchased a large furnishing stock at a discount of 47½ per cent., they are holding a special sale at their establishment at 62-79 Hampstead Road, W., including a vast assembly of charming and useful furniture, carpets, ironmongery, china,

glass, &c., of all kinds, at bargain prices. Among the more notable items of the sale are many excellent dining-room suites, including the "Torrington," in oak, walnut, or mahogany; a pleasing old-world design 4 feet 6 inches sideboard; chairs

in leather or frieze velvet; dinner waggons, &c.; the Sheraton design "Newlyn" suite in inlaid mahogany and leather; and a capital "Wilmington" suite in carved antique oak. There is also a quaint and commodious hall fitment, with cupboards, drawer, umbrella stand, &c., in fumigated oak, with copper fittings. In bedroom suites will be found the "Wargrave," in the Sheraton style in mahogany; the "Kintore" suite, in solid green-stained ash or fumigated and inlaid oak; the "Waterville," in hazelwood, &c. A host of dainty furniture, Sheraton cabinets, tables, &c., for the drawing-room, many beautiful bordered carpets, &c., of all sizes, and a great quantity of silver, electro-plate, china and glass items will be found in the special sale catalogue.

BUILDING AND BUILDERS.

ON Saturday afternoon the foundation-stone was laid of a new north transept in connection with the restoration and enlargement of Wednesbury parish church. The total cost of the new building is expected to be from 1,500*l.* to 1,600*l.*

THE foundation of the new church (St. Aidan's) for the Clonliffe district of St. George's parish, Drumcondra, was laid by His Grace the Lord Archbishop of Dublin on Saturday afternoon at 3.30 P.M. The site for the church occupies a commanding position on Drumcondra Road, at the corner of Dargle Road.

MEMORIAL-STONES of the new schools and classrooms which are being erected adjacent the Congregational church, Park Road, were laid on Friday. The schools are but a portion of a large extension scheme, which is to include the enlargement of the church, the provision of a ladies' parlour, a caretaker's house, &c., the whole to cost 4,200*l.*

IN connection with the erection of the new school by the Dalkeith Burgh School Board on the site of the old Dalkeith Ironworks, 12,000*l.* has been obtained from the Public Works Loan Board to meet the cost. The loan is to be repaid in forty years in equal half-yearly instalments. The Board have decided to give the new school the name of the Dalkeith Burgh King's Park public school.

THE foundation-stone was laid by Mr. Beerbohm Tree on the 10th inst of a new theatre which is in course of erection at Tunbridge Wells, admirably situated right in the centre of the

picturesque town. The exterior of the Opera House (as it is to be called) will present a massive and solid appearance. It is to be carried out in red brick with Bath stone dressing, while the façade is to be in the Georgian style of architecture. Inside, everything will be effected with the idea of comfort and general convenience. There will be 120 orchestral stalls, 180 tip-up seats in the dress-circle, 170 pit stalls, 500 seats in the pit proper, and 300 seats in the upper of the two semicircular galleries. Thus the total seating accommodation of the house will be 1,200. The proscenium opening will be 28 feet by 30 feet, and the depth of the stage 38 feet by 50 feet. In addition to the private boxes, the sides of the house immediately adjacent to the stage will be occupied by rows of ornamental pipes for the proposed organ, which is to cost 200l. The decorations will be in Louis XIV. style. The new building will cost over 30,000l., and is being built to designs prepared by Mr. J. P. Briggs.

VARIETIES.

THE new church of St. Michael and All Angels erected at Northfield, Rotherham, has been consecrated.

A SPECIAL meeting of the Brierley Hill Urban Council was held on Monday evening, when Mr. Lailey, Heysham, was appointed surveyor out of thirty-two applications.

THE new Sacred Heart chapel and sacristies which have been added to the church of SS. Peter and Paul, North Street, Wolverhampton, as a memorial to the late Canon Duckett, who was the pastor of the church for forty-seven years, were dedicated yesterday. The cost of the work reaches 1,700l., towards which about 960l. has been obtained.

THE opening address of the sixth session of the Glasgow Technical College Architectural Craftsmen's Society was delivered by the president, Mr. Jas. M'Kissack, on Friday, the 11th inst. The subject of his remarks, "The Conditions and Problems of Modern Architecture," was treated in a manner well calculated to be of value to both craftsman and architect. The syllabus placed in the hands of the members should prove conducive to a most profitable session.

THE handsome buildings which have been erected in Eleanor Street, Grimsby, to form the offices of the Grimsby School Board, were formally opened on the 9th inst. On the ground floor is a large general office, clerks' private office, type-writing room, inquiry lobby entrance and staircase hall; on the

first floor a large board-room and various other apartments, whilst the top storey is utilised as the caretaker's residence. The fittings are chiefly of oak, and there is electric light throughout. The cost is about 4,000l.

THE opening meeting of the winter session of the Lancashire and Cheshire Antiquarian Society was held on Friday night at the museum, Owens College, Manchester. The president (Professor Boyd Dawkins), the Hon. Auberon Herbert, Mr. R. D. Darbishire, Mr. H. T. Willett, and others exhibited interesting specimens of palæolithic implements. The principal address upon the exhibits was given by Professor Boyd Dawkins, who particularly called attention to the large number of palæolithic implements to be found at Savernake, in Wiltshire, and pointed out that many of the exhibits were not artificial but natural flints, and were therefore of no value as evidence of the age of man. Addresses were also given by Mr. R. D. Darbishire and Mr. Mark Stirrup. There was a large attendance of members and their friends.

THE autumn council meeting of the Bristol and Gloucestershire Archaeological Society was held at the Guildhall, Bristol, under the presidency of Alderman F. F. Fox. After the minutes of the last meeting had been read, the usual reports from the treasurer, secretary and editor were given, and the editor announced that the second part of the volume of Transactions for 1900 was now completed, and would be issued in about a fortnight's time. The reports upon the spring meeting at Almondsbury and the summer meeting at Chipping Campden were most satisfactory. The question as to the districts to be visited in 1902 was then discussed, and it was finally decided to hold the spring meeting at Banwell and the summer meeting at Tewkesbury.

ON Saturday last the well-known music publishers, Messrs. J. Curwen & Sons, Limited, gave an "At home" at their new premises, 24 Berners Street, Oxford Street, W., when a large and representative company attended to inspect the establishment and to enjoy the excellent programme of music given in the Purcell Room on the first floor. The premises, which were formerly a private residence, have been altered to meet their new requirements by Mr. Harrison Townsend, architect, of 29 Great George Street, Westminster, and he appears to have successfully utilised every available inch of space, while several features of the old house have been preserved, among others the original scrolled iron and mahogany staircase rails. The whole has been rendered fireproof, radiators for heating purposes have been fitted all over the establishment, and the

electric light has been installed, which, with other improvements, renders the premises a thoroughly up-to-date business centre.

THE autumn general meeting of the Association of Municipal Corporations will be held in London on Wednesday next. In the agenda it is proposed to discuss an important question in the constitution of the Association, viz. "That the Council shall consist of twenty-five county boroughs, twenty-five ordinary boroughs, the City of London, and one metropolitan borough for every three such boroughs members of the Association." The town clerk of Longton will call attention to the refusal of the Board of Education to allow the non-county boroughs to have powers to carry out the Technical Instruction Acts. It is also proposed to memorialise the Government to lessen the cost of private bills by including many of their clauses in public bills, and to consolidate and amend the laws relating to public health. A representative from Harrogate will move that one uniform series of by-laws be adopted in boroughs for regulating the driving of motor-cars, and Newbury asks for the exemption of secondary and Board schools from rating.

AN ALTERNATING CURRENT DIRECT-COUPLED ELECTRIC LIFT.

THE Safety Lift and Elevator Company (M. T. Medway, 10, Rolt Street, Deptford), belongs the credit of making and erecting the first direct-coupled alternating lift. Hitherto it has been impossible with an alternating current to make a motor that could be coupled direct to a lift gear, and start with full load, or even a part of it. It has been necessary, therefore, in towns where the electrical installation is on the alternating current system, either to keep the motor running day, driving with belts or a set of pumps to work an hydraulic lift, both of which methods make the working a very expensive item. Mr. Medway can now supply reversible alternating current direct-coupled lifts with all the advantages of those worked by continuous current, taking up even less room and at a very small additional cost, a most important advantage derived from this system being that power is only used when the lift is running. They have also perfected a patent alternating magnetic brake, of which they are the patentees and sole manufacturers, and also of the patent standard electric lift controller for continuous current direct-coupled lifts.

HODKIN & JONES, LIMITED.

WE have much pleasure in announcing that the well-known firm of Hodkin & Jones, artificial stone and concrete paving slab manufacturers, of Sheffield, has been registered as a limited liability company with a capital of 40,000*l.* in 1*l.* shares.

Messrs. Hodkin & Jones, Ltd., are erectors of fireproof constructions and general concrete workers, manufacturers of patent plaster partitions, designers and layers of marble mosaic, importers of foreign rock asphaltes. The business has hitherto been carried on by H. Hodkin, H. H. Hodkin, W. Jones, A. Hodkin, W. Hodkin and E. Hodkin, at Havelock Bridge Works, Queen's Road, Sheffield. Qualification, 500*l.* Solicitors to the company, Messrs. Alderson, Son & Dust, Sheffield. Registered offices, Havelock Bridge Works, Queen's Road, Sheffield.

WORKMEN'S COMPENSATION ACT.

A PAPER was read on Tuesday at the annual meeting of the Law Society by Mr. Muir-Wilson, Sheffield, on "The Workmen's Compensation Acts, 1897 and 1900." He discussed the practical results of the working of the Acts as affecting the workman, suggested different views that might be taken of questions that have been disposed of on appeal, and invited discussion upon points on which the statutes might be amended and amplified. The paper was a careful review of the numerous questions which have arisen under the Acts in question, and a statement and discussion of the leading cases bearing upon them. In the matter of appeals, he said that the present conditions under which an appeal might be brought was presenting a scandal so serious as to excite the contempt of the ordinary lay mind. There were forty-nine appeals undisposed of in the list. The last day on which any appeal was heard was March 13, 1901, since which time the arrears had been accumulating. It had been whispered that the House of Lords and the Court of Appeal were a little at variance over the treatment of appeals in the Lords. One hoped otherwise. The practical point, however, was that many appeals had been standing in the list for months, and would continue to do so in view of the Long Vacation, thereby causing a denial of justice to litigants. The amendments of the statute which he suggested were as follows:—(a) In section 1 (1) omit the words "by accident," and so dispense with

the doctrine laid down in the cases of *Hensey v. White*, *Lloyd v. Sugg*, *Timmins v. Leeds Forge* (supra), and similar decisions as to the element of fortuity; (b) section 7 (1): repeal the whole of this sub-section and extend the Act to all workmen as defined in the Employer's and Workmen's Act, 1875 (38 and 39 Vict. c. 90, s. 10), and include seamen and apprentices. Amend (2) to be in accord with this proposed alteration. (c) Schedule 1 (13): confer upon the workman a right to apply to fix a lump sum as redemption of any weekly payment. (d) Schedule 2 (8): omit all provisions dealing with registration of a "memorandum of agreement."

UNSAFE BALCONIES.

THE Manchester city coroner (Mr. S. Smelt) lately held an inquest on the body of Fanny Dewhurst, of 22 Upper Chorlton Road, Whalley Range, who was killed in Deansgate by the fall of a large stone from a balcony.

Thomas Latham, a clerk employed by Messrs. Leigh & Sillavan, 66 Deansgate, stated that his firm occupied the first floor. A small balcony opened from a window over the entrance. Three ladies occupied it in order to view the procession in connection with Lord Roberts's visit. Some paper had been put over the stonework to protect the ladies' dresses. The balcony had been used three or four times a year by people viewing processions.

After the procession had passed he went to remove the paper, which had been held in position by several metal weights, weighing in all about 25 lbs. The last of the pieces would weigh about 5 lbs. As he was lifting this up the stone slipped from under and fell into the street. So far as witness could see there was nothing to hold the stone in position, and he was astonished that it had kept in position so long.

The Coroner said the cause of the mischief was the insecurity of the stone. Owners of property frequently neglected to see whether balconies and other such places were in a safe or unsafe condition. They seemed to think that they would last for ever, and it did not occur to them that material would wear out. The accident, he said, showed how necessary it was that buildings should be regularly inspected. If the accident had happened within a short time of the stone having been fixed in position, he would not have hesitated to have advised the jury to send the responsible person for trial on a charge of manslaughter. In this case, however, the stone had

been in position for more than twenty-five years. At the same time, he added, a person ought not to be allowed to come into a court and say, "I did not know it was dangerous." If they had examined it they would have found it out. He only wished that the law was strong enough to allow him to send some one for trial. If the jury were satisfied that it was an accident, he would take their verdict to that effect.

A Juror: If there are so many unsafe places in this city there ought to be a representation to the Corporation.

The Coroner: I will make it my duty to speak to the town clerk or the Lord Mayor.

The jury then returned a verdict of accidental death.

THE WIDENING OF PICCADILLY.

THE improvements committee of the London County Council have prepared another report on the proposed widening of Piccadilly between Hyde Park Corner and Walsingham House. It is stated that the opponents of the scheme either misapprehend the Council's proposals or are entirely ignorant of the facts. The committee therefore recapitulate the main points as to the origin of the scheme, the need for the improvement, the circumstances of the Council's approval and the action of the First Commissioner of Works. The objections to the scheme, as stated in the petition forwarded on October 1 by Mr. Basil Holmes, which bore about 350 signatures in all are referred to. The wording of the petition and the arguments used therein entirely confirm the committee's opinion as to the existence of a complete misapprehension. The committee, in their report, follow closely the case presented by their chairman, Mr. William Davies, in his letter published in the *Times* of August 17 last. The widening will, they say, affect fifty-seven trees, of which forty-two will be preserved untouched in their present position. Of the fifteen remaining, seven, which are young, will be transplanted into tree pits in the new footway, thus leaving only eight trees which will not be preserved. Some of these eight are already dying, and would have to be cut down before long, but even these will be left until it appears in the progress of the works that they must be removed. The Council have arranged to plant nearly twenty new trees on the footway near Hyde Park Corner. All the work connected with the trees will be executed under the supervision of the expert officers of the Commissioners of Works, and that department will maintain

all the trees in the widened thoroughfare. It is contended by the committee that the improvement is part of a complete scheme, and is intimately connected with the widening of Kensington High Street between Church Street and Cumberland Place at an estimated gross cost of 405,000*l.* and an ultimate net cost of 87,500*l.* Much of the property needed for that improvement has been acquired, and the paving and other works will be put in hand at the earliest moment possible. Moreover, the Council has obtained powers for the widening of St George's Place, Knightsbridge, between William Street and Wilton Place, at an estimated net cost of 32,000*l.*, and by arrangement with the Ecclesiastical Commissioners, who are the freeholders of nearly all the property needed for the improvement, the work will be put in hand next year. In regard to the eastern portion of the thoroughfare, the committee have not yet succeeded in making an arrangement with the Commissioners of Woods and Forests, who are the freeholders of most of the property on the northern side of Piccadilly between Piccadilly Circus and Sackville Street. The committee add that negotiations have recently been opened by a syndicate for the acquisition of Walsingham House and the Bath Hotel, with a view to the erection of a new building upon the site. It may thus be possible in the near future to secure the setting back of the new frontage in order to widen this part of Piccadilly. The line already laid down by the Council for the widening westward from Walsingham House lends itself to the continuation of the widening eastwards whenever an opportunity occurs. If arrangements can be made at a future time for extending the widening as far as Arlington Street the light traffic passing eastwards along the widened portion of Piccadilly and desirous of reaching Charing Cross or the City can pass along Arlington Street and St. James's Street and into the Mall where that thoroughfare is continued into Charing Cross, with the result that the congestion of traffic in Piccadilly near the circus will no doubt be largely relieved.

The committee observe that there are several objections to Mr J. Wolfe Barry's scheme. It would inevitably destroy nineteen fine trees in the Green Park, and more than fifty trees (nearly thirty being large ones) in Hyde Park, because the top of the tunnel would be only about 3 feet from the surface of the park, and there would, therefore, not be sufficient room for the roots of the trees. The scheme would necessitate the appropriation of about 1.4 acre of the Green Park and .82 of an acre of Hyde Park, whilst the Council proposes to acquire only .63 of an acre of the Green Park. Moreover, Sir J.

Wolfe Barry proposes to deliver the traffic through his subway on to the north side of Knightsbridge and the south side of Piccadilly, which must involve a crossing of the traffic. The open approaches would be unsightly, and, with all its imperfections, the estimated cost of the subway (110,000*l.*) is nearly four times as much as that of the Council's proposal, which latter has the approval of Sir E. Bradford and other experts in regard to the relief of the congested traffic. Another scheme which has occupied the attention of the committee is that of Mr. F. W. Verney, who suggested the carrying of the north and south traffic under Piccadilly by a subway from Park Lane to Grosvenor Place. This scheme the committee regard as likely to provoke considerable opposition because of its interference with the portion of Hyde Park near Stanhope Gate and also with the western portion of the garden of Buckingham Palace. They do not see their way to advise the Council to undertake at the present time either of the suggested subway schemes, but they point out that the Council's scheme would not prevent the construction of a subway at any future time.

The committee mention that, in connection with the scheme, they have, with the approval of the First Commissioner, arranged for the construction of a gate near Walsingham House, so that fire-engines may, if occasion requires, be driven into the Green Park near the houses abutting upon the eastern side.

In conclusion, the committee state:—All arrangements have been made for obtaining the materials and for proceeding with the work, the only thing necessary being the formal consent of the First Commissioner to proceed with the scheme, which, it will be remembered, was initiated by him. The works manager has informed us that the postponement of the work by the First Commissioner during the recent recess has involved a loss to the Council of several hundreds of pounds sterling. This is partly owing to the fluctuations of the market for the various materials, and partly because arrangements were made for the work to be proceeded with at the same time as some alterations to the roads at Millbank, but instead of being able to use the hardcore from Millbank for filling at Piccadilly the Millbank scheme has had to be charged with the cost of carting away a portion of the hardcore to shoot, and there is no doubt that the Council will now have to pay for a supply of hardcore for Piccadilly when it is needed. We are advised that further postponement of the work will increase the loss to be incurred. If the formal consent of the First Commissioner for the work to be proceeded

with be given within two or three weeks from the present time, we shall direct the manager of the works department to put the work in hand forthwith. This will insure the completion of the work within about four months from the time of commencement, and therefore at least two or three months before the Coronation. We have sought an interview with the First Commissioner with the view of obtaining his formal consent for the work to be proceeded with, and have received a letter from the secretary of H.M. Office of Works as follows:—

H.M. Office of Works: October 7, 1901.

Sir,—I have seen the First Commissioner and informed him of the wish of the improvements committee to discuss with him the present position of affairs in regard to the Piccadilly scheme. Mr. Akers-Douglas will be happy to meet the committee, but he is anxious to postpone a meeting for a fortnight or three weeks, and he trusts that to this there will be no objection.—I remain, yours faithfully,

ESHER.

As soon as we have had the interview with the First Commissioner two or three weeks hence we shall report to the Council any arrangement made, but having regard to the correspondence which has recently taken place in the newspapers, and to the petition to the Council to abandon the scheme, we have thought it right to report at once all the facts thus fully to the Council.

COUNCILLORS AND CONTRACTS.

ACCORDING to the *Leeds Mercury*, Mr. Wm. Towler, of the Globe Foundry, Leeds, has called public attention to the fact that Mr. Joseph Henry, though a member of the Leeds Corporation, now holds a sub-contract for the supply of ironwork required for the sewerage of the city, and gravely asserted that this is not in the public interest.

It may be remembered that at the close of last year Mr. Towler made a similar complaint.

We have asked Mr. Henry for his answer to Mr. Towler's strictures, and he has given it.

In an interview with one of our representatives, he said:—

For some five or six years before I became a member of the City Council I supplied ironwork used in sewerage by direct contract to the Corporation, and after I was elected I supplied similar material, which has long been a specialty of our works, to sewerage contractors. This was done quite openly, and

until the recent Manchester case I had not the least notion that, as a member of the City Council, I was not entitled to do so.

As soon as the Manchester case transpired, I went to the town clerk (Mr. Jeeves) and consulted him. I explained what I had been doing, and asked him whether I was or was not warranted by law. His answer was in the negative. That being so, I took steps the same day to release myself from the obligation I was under to continue supplying the material to the Corporation contractor. When the work in hand had been completed, the supply was stopped. Knowing that, as a member of the Corporation, I could enter into such contracts either directly or indirectly, if my works were made a limited liability company, I had them so transformed.

Subsequently new sewerage contracts were advertised and let. The successful contractor invited tenders for the supply of the required ironwork. The invitations were not confined to Leeds firms, but given to others elsewhere. My firm, among others, sent in a tender.

A short time afterwards the contractor came to see us. He said that he could not accept our tender, it being too high, but that if we would accept the lower price of a Lancashire firm he would be willing to place the order with us. His reason for doing this, he explained, was that we were on the spot and knew exactly the kind of material required.

We requested time to consider the matter and he gave us twenty-four hours. Next morning he wired saying that he must have an answer by noon, and although the price was an exceedingly low one, we accepted it. Had we not done so the work would have gone to Lancashire, and Leeds would have lost it. My answer to Mr. Towler is that in so doing I had a legal warrant.

As I have shown, this was a sub-contract, but my firm being a limited company, is entitled to accept a contract directly from the Corporation, just as some other limited companies with members in the Corporation, have supplied it with large quantities of material.

The following is Mr. Towler's reply:—

I have read the statement made in an interview with a representative of the *Leeds Mercury*. This statement is also the nature of a reply to mine of Friday last.

I wish to point out the disparity between the two versions of his reasons for converting his firm into a limited liability company. In the letter written to the *Yorkshire Post*, on the spur of the moment, he says his object was to give his son an

manager an interest in the business. But evidently Councillor Henry, on further consideration, thought that the public of Leeds were, after all, too intelligent to swallow that story; that they were capable of putting two and two together; that they would compare dates and facts, namely, the refusal to supply goods to the contractor because of its illegality in December; the instructions for conversion into a limited liability company in January; the new sewerage contract to be placed in April; the registration of the new company in May; and the acceptance by Joseph Henry, Limited, of a contract with the new sewerage contractors on May 9.

And now we have the "new and revised version"—vide *Leeds Mercury* of Monday—which I take to be the true version, and which says:—"Knowing that as a member of the Corporation I could enter into such contracts, either directly or indirectly, if my works were made a limited liability company, I had them so transformed." Candour is a virtue, but it is less virtuous when one feels that the true and outspoken statement is the only one likely to be accepted.

My first statement in my letter to the *Yorkshire Post* of the 11th inst. was that in some years the amount of business done by Councillor Henry for the Corporation was about 5,000*l.*, or 500*l.* a week. In his reply he does not deny this fact, but in a postscript to his letter simply says that the amount supplied by Joseph Henry, Limited, last month was 54*l.* 2*s.* 9*d.* Does he really believe that the people of Leeds are so gullible as to suppose that he would go to the trouble and expense of converting his firm for a mere flea-bite of 54*l.* per month?

Now, to show the amount of trade that he has done, I collect that when the Hunslet Road sewers were being constructed, and when he got the contract for the cast-iron girders, total of about 600 tons, he considered the order so great that he had to take a small foundry in Elland Road on purpose to make them; and in this specially acquired foundry he turned out on an average two girders, or 48 cwt., per day, and all this in addition to the standing contract for gully grates, manholes, &c.

Everybody who knows anything at all about this matter, knows perfectly well that 54*l.* per month is anything but a true and fair representation of the average amount of trade in this contract. The statement is most misleading.

In my letter to the *Yorkshire Post* I dealt solely with the principle of this sub-contracting, and demonstrated very clearly, I think, that by this system the ratepayers are not likely to get the best value for their money.

The inside influence of the contractor would be subversive of the ratepayers' interests, as his personal interests would be likely to have the first consideration. I showed, further, that goods supplied by a councillor might be passed that would not be accepted from an outside contractor. A man ought not to put himself in the position, even a little remotely, of being both buyer and seller. I think that is most reasonable. If the interests of buyer and seller clash, human nature being what it is, we may expect where the advantage will lie.

In his reply, both in the *Mercury* and the *Post*, Councillor Henry evades my arguments altogether. He does not mention the ratepayers' interests for a moment; but the whole and sole question with him is, "Can I get my pound of flesh legally?" I do not say that he cannot. I have never argued the matter from the point of legality, but from the "taint-of-suspicion" standpoint. I think the trend of Councillor Henry's replies will convince the public that with him personal considerations are first and foremost, and the interests of the ratepayers come in a very bad second.

Mr. Henry should try to be consistent. In his letter to the *Yorkshire Post* he says that my references to the mere contractors were a tissue of misstatements. What did I say? Simply four things—

1. That he tendered for the ironwork.
2. That his price was too high.
3. That he, being a Councillor, was allowed to amend and reduce his price.
4. That he secured the contract.

How, pray, does Mr. Henry attempt to refute my statements? Why, in his statement to the *Mercury* he becomes a witness on my side. This is what he says:—

1. "My firm, amongst others, sent in a tender.
2. "He could not accept our tender, it being too high; but if we would accept the lower price of a Lancashire firm he would be willing to place the order with us.
- 3 and 4. "Although the price was an exceedingly low one, we accepted it."

Where, I ask, are any misstatements?

I may say that the order would not have gone to Lancashire, but that I have seen another quotation equally low, and I know it would have come to Leeds if Mr. Henry had missed it.

Having replied to Councillor Henry's very dissimilar statements, I should like to mention another matter, in regard to which the ratepayers ought to have an explanation. When

the aforementioned Hunslet Road sewers were to be constructed or enlarged, 500 girders were required for the work. The first drawings and specifications showed them to be made of rolled steel. Tenders for these steel girders were got in by the city engineer from a number of iron merchants. One merchant, on calling to look after the order, was given to understand that it was his, and that the order would be sent on in a few days. Not having heard anything further, he called again and was told that an alteration had been made, and that the girders were going to be of cast-iron instead of rolled steel. On hearing of this, I asked to be allowed to give a tender, but was informed that the contractor for sewerage had them to find.

Now, I want to ask this question, Why is it, when these girders were to be in steel, which Mr. Henry does not make, the Corporation were asking for tenders direct; but when the plans were suddenly changed, and they were to be made in cast-iron, a material of which Councillor Henry is the manufacturer, applicants were then informed that they were to be supplied by the sewerage contractors?

I remember that about the time when this change was made Mr. Boyd, Councillor Henry's Liberal colleague in the representation of Holbeck, was made chairman of the streets and sewerage committee. I think all this looks very suspicious, and that undue influence is brought to bear upon these matters. Some explanation is due also to the fact that the cost of steel girders was to be about 500 at 2*l.* 10*s.* each—1,250*l.*, whilst the price for the cast-iron girders, which Mr. Henry made, was as follows approximately:—500 girders, each 24 cwt., at 4*s.* per cwt.—2,400*l.*, a difference in the cost of about 1,150*l.* This amount would have to be paid for Councillor Henry's goods more than the steel girders would have cost.

GLoucestershire Engineering Society.

THE annual general meeting of the Gloucestershire Engineering Society was held last week. Mr. Hamilton Kilgour, the president, occupied the chair.

The hon. secretary (Mr. J. C. Cooke) read his annual report, which stated that the Society had concluded a satisfactory session under the presidency of Mr. H. Kilgour. The lectures which had been delivered had afforded the members much basis for research and ample opportunities for improving themselves by obtaining a thorough knowledge of the various details of the science of engineering, and had also greatly

furthered the advancement of the Society. Inspection visits of an instructive character had been paid to various engineering works, and had been highly appreciated by the members. The Council desired to thank those gentlemen who had contributed papers during the past session, and also the various firms for permitting inspection by the members of their various works and appliances. The Council had furnished each member and associate with the question for prize paper competition, but had not met with much encouragement. The Society numbers over one hundred members, and it was considered not unreasonable to repeat the request that answers should be supplied and also short papers to last about ten minutes on the respective works under the immediate notice of the members.

The report was adopted, an opinion being expressed that a good number of papers would be sent in for the prize competitions.

Mr. Walton (treasurer) read his report, which showed that the past year, which was started with a deficit of 26*l.* 5*s.* 8*d.*, had terminated with a balance in hand of 8*s.* 9*d.* There were 19 honorary members, 43 members and 43 associates, giving a total of 105.

The report, which was considered highly satisfactory, was adopted.

The librarian (Mr. M. Rowles) presented his report, which was adopted.

One or two members complained of the difficulty of getting a review of the technical papers given by members of the Association to the Public Library, and the Chairman, on behalf of the Council, promised to try and remedy this.

The election of officers was next proceeded with. Mr. H. Kilgour was re-elected president, and all the vice-presidents with the addition of Mr. J. E. Humpidge, were re-elected. A similar compliment was paid the following officers, viz.:—Hon. secretary, Mr. J. C. Cooke; hon. treasurer, Mr. W. Walton; hon. librarian, Mr. M. Rowles. The Council was elected as follows:—Messrs. W. R. Voller, R. Turner, T. Atkinson, F. Trow, P. Grant, W. J. Bache and E. J. Cullis. Mr. W. Hobbs was re-elected hon. auditor.

Votes of thanks were passed to gentlemen who had read papers, to the various firms who had allowed the members to visit their works, and to officers of the Association.

On the proposition of Mr. W. R. Voller, seconded by Mr. W. Wells, 10*l.* was voted for the purpose of suitable literature for the members.

HIGHEST AWARDS:
EXHIBITIONS 1891-93-94-95-97.

The Architect.

THE WEEK.

There is a fatality about Christ Church Cathedral in Lincoln. In old records relating to it we commonly meet expressions which are suggestive of ruin, and the carvings and engravings made from time to time during the greater part of the nineteenth century excite surprise that the building was not treated as a dangerous structure and closed. Unfortunately ruin is again impending. What was considered at the time as "a fortune" was expended on the restoration. But the late Mr. STREET, believing that Caen stone was used by the thirteenth-century masons in the work, specified its adoption. In the small volume by WILLIAM BUTLER, "The Cathedral Church of the Holy Trinity, Dublin" (London: ELLIOT STOCK), we are informed "that the time is rapidly approaching when Christ Church Cathedral, so far as the outside is concerned, will be a sad-looking ruin, upon which some one will have, sooner or later, to expend a very large sum of money." Only a quarter of a century has elapsed since the restoration. Christ Church somehow excited more prejudice against Mr. STREET than any of his other works. It offended Irish susceptibilities by suggesting that the monuments should be broken up for concrete, and when advice was neglected he relegated them to the crypt. It is not, however, the place to discuss his treatment of the cathedral, but much information on the subject will be found in Mr. BUTLER'S guide-book, which, strange to say, is the first attempt of the kind. Dublin is not enterprising in the publication of books, and many varieties, as well as e-books, are neglected. The history will be found to be more novel than that of any of the English cathedrals. BUTLER understands architecture, and his descriptions may be trusted. He has avoided the usual cicerone's error, and does not expatiate over trifling objects. The book is interesting for many reasons.

The *Journal of the Sanitary Institute* for October is devoted to the attempt to prepare a report on cowls and terminals which was undertaken "many years ago" by a committee consisting of Sir DOUGLAS GALTON, Mr. W. E. and Mr. ROGERS FIELD; Mr. J. WALLACE PEGGS afterwards added. Experiments were made in order to establish a standard value, but it was necessary to systematise them, and it cannot be said the work is ever likely to be completed. The name of Mr. ROGERS FIELD, who led the other members, is most closely connected with the attempt, and the vast number of pages of figures always be evidence of his industry. But although W. N. SHAW, of the Meteorological Office, has endeavoured to put order into what he calls "a selection of the fragmentary attempts," it cannot be said that sanitary science is enriched by the multitude of figures. As they may have their use to the meteorologists of a later age in recording the direction of wind, but, considered from the architect's standpoint, they resemble the characters of a dead language to which there is no key. It was proposed to test cowls and terminals, every one expected that those in use would be selected and described in such a way as to prevent any error of identification. But instead we have miniature models, without any clue to the manufacturers, and as the appliances correspond in their external appearance, there is no security against error, and the observations leading to an inefficient cowl may easily be applied to one which well serves its purpose. We doubt if manufacturers in all cases be able to identify their work. An architect imagines the tables will guide him in the selection of a cowl, but is certain of disappointment. Some of the tests have gone through in 1884, and they must relate to cowls which are no longer to be found in the same form. There are improvements in ventilators as in other appliances, but in the experiments it might be supposed that the cowl was to remain inactive until the report was published. Another circumstance which must create uneasiness is that there is rarely any mention of the diameter of the cowl or of the size of the terminal. From the position occupied by the Sanitary Institute we expected a volume of

a different quality, and one in keeping with those already issued. Probably the good sense of the Council would have allowed the observations to remain in their chaotic state. The contribution of 2,000*l.* by Mr. ROGERS FIELD to defray expenses is, we surmise, the explanation of the publication which, unhappily, can have no more than a misleading result, in spite of the good intentions and the hard work of its authors.

A MEMBER of the Town Council of Leek, Mr. JAMES CORNES, has endeavoured to solve the urgent problem of providing cheap houses by erecting fifty cottage dwellings in the town which can be let at an inclusive rental of 5*s.* 6*d.* and 5*s.* 9*d.* a week. He contemplates increasing the number to 300. In each there are three bedrooms and a bathroom. The plans were prepared by Mr. J. T. BREALEY. There is a small garden in front with varnished oak palings. The walls are of red brick and the roof is covered with red tiles. Each dwelling, which is of two storeys, has a bay window to the two principal rooms. The difference between the 5*s.* 6*d.* and the 5*s.* 9*d.* houses is that the latter have a passage leading from the front to the middle room. In the former houses the front door opens directly into the main living room or parlour, which measures 13 feet in width by 14 in depth, and is 9 feet 9 inches in height. The large window area afforded by the bay gives adequate light. One of the recesses by the side of the fireplace is fitted as a cupboard. The bay is provided with a flat broad sill for window gardening. A door opens from the end of the sitting-room opposite the entrance and leads past the bedroom staircase to the kitchen. The latter has a tiled floor, and measures 9 feet by 13 feet. It is furnished with three doors, apart from the entrance, opening into the scullery, scullery-bathroom and back yard respectively. The scullery is reached by a short flight of steps; it contains a broad stone shelf, and is ventilated by a tube having an inlet from the yard and an outlet running up through the roof and acting on the way as an outlet for the smallest bedroom. The kitchen has a heating and cooking range which serves several purposes, and there is a second grate, which can also be utilised. Much ingenuity is seen in the heating arrangements. The bathroom is fitted with a full-sized iron enamelled bath, which is supplied with hot water by a pipe running from the range boiler, and with cold water through a shower-bath sprinkler fixed overhead. Owing to the proximity of the kitchen fire the bathroom is kept warm in cold weather. A portion of the scullery and bathroom walls are built in glazed brick, while the floor is of concrete, with a cement face finish. When the rents are considered, the cottages are remarkable for their convenience, and they are free from drawbacks which are common in cheap dwellings. The Leek experiment merits attention, and there is more likelihood of success by imitating Mr. CORNES'S example than by holding meetings and protesting against the indifference of the Local Government Board.

GOVERNMENT officials in England have always the power of forgetting at command, but in France the Ministers and their subordinates are also endowed in the same manner. An example of it has lately occurred. The discoveries of M. and Mme. DIEULAFOY at Susa have excited nearly as much interest as those of BOTTA at Nineveh. The frieze of enamelled tiles representing archers was as much of a surprise as the human-headed bulls when first seen in Paris a half-century ago. For a time the two explorers received the recognition which they merited, but admiration does not long endure in France. The Government sent M. DE MORGAN, who worked so well for French interests in Egypt, to continue the exploration commenced by M. and Mme. DIEULAFOY. He has lately sent a cargo weighing about eighteen tons of various objects found by him to the Louvre, and which are said to be mainly inscribed bricks. Although they are so closely connected with the discoveries of M. and Mme. DIEULAFOY, and a part, if not all, will be placed in the room adorned with the archers' frieze, it has not occurred to the official mind that any communication should be made to those who have so much interest in preserving the character of the existing Susa collection.

BATTLE ABBEY.

TENNYSON prefaced his drama "Harold" by a sonnet, which records his feelings when, on visiting Battle Abbey in 1876, he compared the beauty of the peaceful garden with the momentous struggle on the same spot:—

Here rose the dragon-banner of our realm,
Here fought, here fell, our Norman-slander'd king,
O Garden blossoming out of English blood!
O strange hate-healer Time! We stroll and stare
Where might made right eight hundred years ago.

Historical evidence is too strong to admit of any doubt about the connection of the abbey with the victory of WILLIAM THE NORMAN. TENNYSON adopts the theory that the CONQUEROR after his victory resolved to build a commemorative church.

I vow to build a church to God
Here on the hill of battle; let our high altar
Stand where their standard fell.

But the more common belief is that WILLIAM'S vow was taken prior to the battle. Each army had seen

The South Saxon battlefield on which the fate of England was determined presents no sign of war, and in that respect it corresponds with most others throughout Europe. If it were not for tradition, the title Battle Abbey would be incomprehensible. There is no sign of war, and instead of monastic ruins a large and remarkably well-preserved mansion, only partly Gothic, meets the eye of the visitor.

the summit of a small hill. The Normans were at Telham Hill, which, according to the Ordnance Survey levels, is 286 feet above the sea. The ground slopes downwards and rose again, and at the village of Peasemarch the level is 294 feet. The two leaders were, therefore, standing at almost the same height. Between them was Sen-lac or Sanguelac, the lake of blood. The English

obtained the commission to bring monks from Marmoutier. They were not satisfied when they saw the place for which they had left the banks of the Loire. WILLIAM wished to see the high altar of the abbey church on the site where the standard of HAROLD was erected, but the foreigners shivered at the thought of living on so desolate a ridge. They implored the grant of a more eligible site. WILLIAM, however, was not the man to alter a selection which had been determined by so many causes. As to objections about the absence of quarries to provide building stone, he expressed his readiness to employ his ships in importing stone from France.

The progress of the monastery was slow. The builders did not work with the heartiness which raised so many buildings amidst difficulties compared with which those at St. Martin's Abbey were only trifles. It was not until 1094, or about a quarter of a century after the commencement of the works, that the church was ready for consecration. The accommodation sufficed for only fifty monks instead of about one hundred and twenty as contemplated. WILLIAM THE CONQUEROR was not spared to see so partial a completion of his "Ecclesia Sancti Martini de Bello," but he could not have anticipated that in less than five hundred years after his victory the memorial high altar was destined to be overthrown by order of another English sovereign, and that in our time a few broken stones amidst ferns and other vegetation are all that can recall it.

The monks of St. Martin's Abbey would have been more than human if they did not esteem themselves above their English brethren. They were representatives of the monarch, and while he lived could count on his protection. After the death of the first abbot it was necessary to consecrate a successor. The abbey being in the diocese of Chichester, the bishop considered the ceremony should take place in the cathedral. The monks complained to WILLIAM, and the bishop was ordered to go to the abbey and to consecrate the abbot before St. MARTIN'S altar. Bishop STIGAND was no friend of the new rulers, and as a further proof of the king's displeasure it was decreed that the usual hospitality was not to be shown to him or his attendants.

The privileges of the abbey were unique. The abbot exercised supremacy within a limit of three miles; his tenants were exempted from tolls in other districts, and a market could be held every Sunday in the village. Once within the abbey gateway a malefactor was safe, and wherever the abbot met a criminal on the way to execution he could grant his pardon. EDWARD III. endeavoured to dispute the last mentioned right, but without avail. The abbot was also a lord of Parliament.

The Norman monastery was in course of time considered to be unsuited to a community which stood so high in royal favour. A license to castellate was granted by EDWARD III. The fine gateway was erected in 1338 by Abbot RETLYNGE, and all who have seen it must have wondered at its preservation. Well would it be for many English buildings if so little need of restoration was required as in the gateway and many other parts of Battle Abbey. The principal losses are the statues which once occupied the niches.

The history of the alterations in the abbey must be traced from the style of the work which remains. In 1538, when the suppression of monasteries was ordered, Battle Abbey possessed a revenue which has been estimated as equal to 10,000*l.* present currency. It was therefore a tempting prize to courtiers. But the commissioners were disappointed when they found there was so little portable treasure in the buildings. According to one official, "the implements off householde be the worste that ever I se in abbaye or priorye; the vestyments so old and so bayre worne, raggede and torne, as youre lordeshyppes wolde not thynke; so that very small money can be made of vestrye." Another declares that he never saw so beggarly a house, nor such filthy stuff, and he would not give 20*s.* for all the hangings. As from the abbot's accounts new vestments, plate, &c., had been purchased not long before, evidently there was timely information given of the change in King HARRY's disposition, and the valuables were removed where there was no apprehension of the visits of inquisitors. The surrender of the monastery was followed by the payment of pensions to the community. The abbot received 100*l.* a year, which was a larger amount than had hitherto

been granted. The others were allowed the following sums:—The prior, 10*l.*; eight of the monks, 6*l.* 13*s.* 4*d.* each; eight others, 4*l.* each; a novice, 2*l.* 13*s.* 3*d.*

The fortunate favourite to whom Battle Abbey and its possessions in Sussex and Kent (with the exception of the manor of Alciston) were granted was the king's Master of the Horse, Sir ANTHONY BROWNE. The lands in other counties were not apparently included in the gift. BROWNE was to pay a yearly rent of 12*l.*, besides the service of 10 knights' fees. He enjoyed the royal favour during HENRY VII. life, and EDWARD VI. also trusted him. As he was the guardian of the Princess ELIZABETH he erected the parlour known as the library wing for her residence, but he died before it was fully completed. His successor, who received a peerage from Queen MARY and became Viscount MONTAGUE, carried on the work, but it is doubtful whether the wing was then occupied. It was at least uninhabitable in 1858, when the restoration was undertaken by Mr. HENRY CLUTTON. Sir ANTHONY BROWNE was evidently well disposed towards the workmen he employed in his building operations, one of which was the conversion of the old guest-house into a manor-house. His steward advised to pay them fairly, for "if men feel no gain by the labours it were as well that they were gone." The workmen on one occasion were let to a contractor, who "dowet gyve small wages by cause hys owne gayne should be the more." The MONTAGUES suffered during the Civil War. In 1661 the great deer park had to be converted into farms. The monastic kitchen, with its five large fireplaces, was sold in 1683 to raise money by the materials. At last, in 1710, the abbey was sold to Sir THOMAS WEBSTER.

The new proprietor was a citizen and clothworker of London, and seems to have had a weakness for the purchase of ancient residences. He died in 1750, and was succeeded by another knight named WHISTLER. He was no admirer of the abbey, and demolished a large part of it. His widow imitated him, and the buildings were so neglected that the old lady was able to find enjoyment in walking along the galleries on wet nights in pattens. She lived until 1810. When her great nephew Sir GODFREY VASSALL inherited the property he endeavoured to make amends for the neglect of his predecessors. But the restoration was too costly for his resources. The timber, which was worth 100,000*l.*, was sacrificed to his necessities, and then the property was let and the owner went abroad. In 1858 Lord HARRY VANE, afterwards Duke of CLEVELAND, purchased Battle Abbey, and then a new era began.

The Duke and Duchess were able to appreciate the value of the property in its archaeological as well as in its residential conditions. It was impossible to realise what Battle Abbey was prior to the Dissolution. The church, for example, was 315 feet in length, and if one of the seals could be accepted as evidence it was surmounted by a central tower and four other towers. The site was buried in rubbish for nearly three hundred years. In 1817 a cry was discovered, but Professor LAPPENBERG was justified when he wrote:—"Crumbled and fallen are the once lofty halls of Battle Abbey, and by a few foundation-stones in the midst of a swamp are we alone able to determine the spot where it once raised its towers and pinnacles." Much has been done towards the determination of the plan of the abbey by the last owners, and it is to be fervently desired that whoever will gain the distinction of becoming possessor of an incomparable historic site will be able to realise how great a reputation can be gained by utilising the evidence which has survived, in spite of vandalism and neglect, for the investigation of the numerous archaeological problems which await solution around the Ecclesia de Labataille.

FILIPPO BRUNELLESCHI.*

AN architect alone is competent to treat of a great architect's life, for without the technical knowledge which is only to be acquired in practice, it is not possible to do justice to the works which acquired greatness through their designer. Unfortunately the ordinary reader, at least in England, will not read books by architects, and in a case where a biography of an artist like the designer of the Florentine dome is desirable for the instruction of the

* *Filippo di Ser Brunellesco.* By Leader Scott. London: George Bell & Sons.

public, it is more likely to attain its end when the author is only a *littérateur*. "LEADER SCOTT" has already shown more than ordinary acquaintanceship with the history of Italian art, and was therefore competent to investigate the data which have been discovered since VASARI's time concerning the career of one of the most versatile of the Renaissance representatives.

It may be well to summarise what was generally known about the wonderful man who not only talked upon everything that was known at the end of the fourteenth and the beginning of the fifteenth century, but whose hands were competent to design buildings, to model statues, to paint pictures, to work in precious metals, to repair clocks, and, when there was nothing important awaiting his attention, to write in imitation of Latin poetry. There was no professor in Florence who was more eligible to discourse on DANTE; he could act well if the character was suited to a performer of dwarfish stature, and there was no more fiery disputant in the academies where philosophy was supposed to reign. Like LEONARDO DA VINCI, this many-sided man was the son of a notary in Florence, where he was born in 1377. He was intended for a scholarly profession—a physician or a notary; but after a trial of both he expressed a preference for art, and was apprenticed to a goldsmith.

Florence in those days possessed several sculptors who have gained renown. FILIPPO was the friend of DONATELLO, and the rival, but not the friend of Ghiberti. He seemed to be destined to be at least their equal, but his failure in the competition for the bronze gates of the Baptistery convinced him that to excel Ghiberti he must either study from a different class of models, or gain a higher position by making architecture the main business of his life. He studied in Rome, and in his thirtieth year returned to Florence, at a time when the completion of the Duomo was contemplated.

The reconstruction of that building had been decreed by the Republican Government, and the designing was entrusted to ARNOLFO, "capò maestro del nostro comune." He found it difficult to secure a firm foundation owing to the presence of water, which was then supposed to be one of the causes of seismological movements. ARNOLFO constructed deep wells to remove the danger, and he is reported to have exclaimed to his building, "I have secured you against earthquakes, may GOD secure you from lightning." As often happened, he was not fortunate enough to see the completion of his building. After him GIOTTO, ADDEO GADDI, ORCAGNA and LORENZO FILIPPI in turn undertook the charge, but after a century and a half Santa Maria del Fiore remained incomplete.

The main difficulty was the roof. What was ARNOLFO's intention is not clear, but there was a notion in Florence that a cupola alone would answer. The domes of San Sofia, St. Mark's and the Pisan Baptistery covered a smaller area. There were debates and competitions without avail. BRUNELLESCHI was in his element in the stormy scenes, and it would seem as if he expected to be entrusted with the work from the strength of his voice rather than from his constructive skill. Astuteness was a common quality with the Florentines, and FILIPPO was evidently playing a deep game throughout the proceedings connected with the selection of a plan. Sometimes his discourse was taken to be a prelude to the description of an arrangement he had matured, but at the crucial moment he would disappear from Florence. At last, when the consuls and masters were sufficiently confused by the variety of projects, BRUNELLESCHI became more definite, and was instructed to prepare a model. It was approved, but the creator was not entrusted with its realisation. Others were joined with him, and what must have caused him most anguish, Ghiberti was made joint-architect. That was the last straw, and FILIPPO resolved to abandon Florence and its buildings. Then he changed his mind, and feigned to be ill. Ghiberti was equal to undertaking a bronze gate which St. Peter might have guarded, but to form a dome over so vast a void was beyond his powers. His weakness before the difficulty could not be concealed, and BRUNELLESCHI was allowed to enjoy the office which his genius had won.

Florence possesses among other works by BRUNELLESCHI the church of San Lorenzo and the Pitti Palace.

At Mantua the Castel San Giorgio is ascribed to him. He died in 1444, and was buried with grand ceremonies in the Duomo, of which the dome is an enduring memorial of his courage and skill in construction.

The foregoing is an imperfect but tolerably exact outline of the biography of BRUNELLESCHI as commonly related in the dictionaries. The volume of LEADER SCOTT presents to us a figure which has far more vitality, and which corresponds with the likeness of the architect which was carved in relief by his adopted son, ANDREA DA BUGGIANÒ. For the information which changes a figure that was little more than a ghost into a vigorous man, many sources have been used which were unknown to earlier writers.

In the first place, instead of as FILIPPO BRUNELLESCHI, the architect should be known as FILIPPO LAPPI, that is, by the family name of his father instead of one belonging to his mother's race. The LAPPI were connected with the noble family of LAPPI-ALDOBRANDI, and both used similar armorial bearings. The architect's father was of some note in Florence. He was a member of the Council of Ten and was employed on several missions. The family was wealthy and owned several houses. It was intended that FILIPPO should in time follow some branch of statesmanship, but with the perversity of genius he joined the Goldsmiths' Guild. According to his contemporary and biographer, MANETTI, he was soon an adept in all branches of the craft, and in a short time became "a perfect master of niello, smalto, emblazonment and relief, also in cutting and setting gems; in fact, he succeeded in everything he touched, in a manner quite wonderful for his age." Nor did he neglect other studies. His perspective drawings amazed onlookers by their realism, especially when they were seen through a small sight-hole. One of his paintings was said to be *cosa miracolosa*. His crucifix of carved wood became historic. If therefore he was considered too self-confident it is evident from contemporary witnesses he was justified by the success of his early exercises.

According to VASARI, when the contest for the gates of the Baptistery was narrowed to a choice between Ghiberti and BRUNELLESCHI, the latter advised the consuls to give his rival the commission, on account of the superiority of Ghiberti's panel. From the account of MANETTI there was no self-sacrifice displayed. The judges recognising the difficulty of deciding offered to divide the work, "but to this FILIPPO would never consent; unless the work were to be wholly his own, he would not touch it, not being inclined to share his honours with anyone else;" the consuls therefore gave the commission to Ghiberti.

Then FILIPPO sold some of his land in order that he might study architecture in Rome, his companion being DONATELLO. There they were employed by the goldsmiths, and BRUNELLESCHI "made several timepieces, and alarm clocks, and the multiplicity of springs and ingenious wheels set him thinking of larger machines which might be constructed for carrying or lifting weights, &c." Architectural detail he scrutinised closely, and he wrote his remarks in characters which he alone understood. With all his virtues he was no believer in diffusing knowledge. He did not reveal to his companion that he was giving any attention to domes, and it was not until after DONATELLO had returned to Florence that BRUNELLESCHI began his investigation of the Pantheon.

The nature of his studies in Rome somehow became known in Florence, for according to MANETTI, "whenever FILIPPO let himself be seen he was pressed into consultations about both private and public edifices." The subject which then was uppermost was the completion of the Duomo. But for thirteen years after BRUNELLESCHI'S return no step was taken of any practical value. He had again and again visited Rome during that time, and we may conclude his knowledge of vaulting was enlarged. Not until 1419, however, was his model accepted. The construction of the dome was the great event of BRUNELLESCHI'S life, and it forms the principal part of LEADER SCOTT'S biography. It would be unfair to attempt an abstract of transactions which owe much of their interest to the detail derived from laborious investigations which will be found in the pages. We can now realise all the difficulties which were before the architect, who was supposed to be about to erect a city which must crush the church, and who appears to have been as constantly watched as if he were eager to

bring disaster on Florence and its citizens. In the history of building there is no more absorbing narrative.

The works, beside the Duomo, which can be credited to BRUNELLESCHI are described at length. Every one has seen illustrations of the singing children which adorned the organ-gallery of the Duomo; but it is not generally known that the architect aided in the arrangements by which the reliefs were placed in position. The following extract is interesting:—

The sacristy contains a remarkable specimen of Brunelleschi's ingenuity—his famous *volta piana* (flat arch). This does not mean merely a depressed arch, but literally a straight and flat bridge built of long blocks of smoothly hewn stone placed slantingly on each side of a keystone and self-supporting. It is, in fact, the masonry of the arch without the curve. When between the years 1431 and 1440, while Donatello and Luca della Robbia were carving their lovely groups of singing maids and joyful children for the organ-gallery and the one for the choir, which were to be placed over the doors of the two sacristies, it was necessary to prepare the stairways that gave access to them. The only means of entrance was by carrying a passage right across the sacristy, and the crucial question was how to do this without its being a blemish to the interior of the well-proportioned sacristy. An arch would presuppose pillars or pilasters, which would spoil the square of the room and take up space. Brunelleschi came to the rescue with his inventive genius, and threw this bridge across the entrance, with a sculptured and perforated parapet, which forms a fine cornice above the arch of the door. The great stones seem supported on air, yet they have made a safe passage for nearly five centuries, by which the singers may pass to their gallery without disturbing the priests robing themselves below.

BRUNELLESCHI differed from many of the Italian architects. He was no mere designer. Accordingly there is an individuality in his works which was not always a characteristic of those who scrupulously adhered to Roman proportions and details. He was a vigorous man, but there is no clumsiness in what he did. He well deserved to be included among the great masters, and the life of him which lately appeared should extend BRUNELLESCHI'S reputation among English students.

THE BIRMINGHAM UNIVERSITY.

AT the monthly meeting of the City Council on Tuesday the Lord Mayor (Alderman S. Edwards) read the following letter:—

The University, Birmingham: October 2.

My dear Lord Mayor,—At the request of the Council of the University of Birmingham, I beg that you will kindly communicate to the next meeting of the City Council our grateful appreciation of the liberal grant voted by the Council in aid of the technical scientific work carried on by the University. The liberality of the City Council will enable us to proceed at once with the erection of a large instalment of the buildings required to give effect to our plans, and to bring at an early date within the reach of the population of the city and the Midlands the opportunity of acquiring the highest and most useful scientific training in connection with the trade and industry of the district. Encouraged by the action of the City Council, and in the expectation of further considerable grants by the local authorities of the neighbouring counties, the Council of the University have this day authorised the buildings committee to prepare plans and specifications for necessary buildings estimated to cost, without equipment and furniture, the sum of 200,000*l.*, and they firmly believe that on the completion of these buildings they will be in a position to realise the best hopes of those who have interested themselves in this great development of higher education.

I desire to take this opportunity of thanking you personally for the kind support which you have given to our application, and beg to remain, my dear Lord Mayor, yours very truly,

J. CHAMBERLAIN, Chancellor.

The Right Hon. the Lord Mayor.

Queen Victoria Memorial.—The plans and drawings of the five architects selected by the general committee to compete for the Queen's Memorial, including the scheme finally chosen, together with a photograph of the sketch for the monument itself by Mr. Thomas Brock, R.A., will be exhibited by command of the King at St. James's Palace on and after November 1. Tickets of admission to be obtained at the Lord Chamberlain's office in Colour Court. Admission from 10 to 4.

EXPLORATIONS IN EGYPT.

AT Owens College, Manchester, Professor W. M. Flinders Petrie gave a lecture on "The Rise of the Egyptian Monarchy." Professor Petrie, whose address consisted mainly of a description of a series of splendid photographic pictures of recent discoveries made by him, shown by the limelight, said he and his associates, in their latest work of exploration in Egypt, had been able to complete the history of the first dynasty and of a large part of the second, and, in fact, to place the facts of the early history of the Egyptian kingdom on a sure foundation as those of any other part of Egyptian history. They had been working in the royal cemetery of the kings of the first and second dynasties. In that cemetery they found the tombs of several kings. The whole had, however, been turned over three or four years ago by a foreign explorer, who, unfortunately, did not succeed in preserving any history. This year, said Professor Petrie, they had once more turned the place over, and with the aid of trained workmen, whose attention and sharpness they had encouraged, they had been enabled from an enormous amount of material to find fragments of importance in tracing the history of the early Egyptian monarchies. They found a successive series of royal tombs, and were able to trace eight kings of the first dynasty. They found writing developed into a continuous mode of expression, instead of pictures with explanatory labels. Professor Petrie exhibited photographs which illustrated the practice of sacrificing captives at the king's tomb, and said it was not at all impossible to suppose that there was an actual slaughter of captives to accompany the king to the future world. This, he said, would not be more astonishing than what we knew was done by our Norse forefathers, and what we knew was the custom of many countries. Amongst the discoveries made were flint arrow-heads, labels, ivory tablets and ornaments for personal decoration, together with vases and other articles buried with the kings and the other occupants of the tombs. All these fragments, he said, had been turned over, ruthlessly broken and scattered far and wide three or four years ago, showing the terrible way in which history had been all but destroyed. With all the difficulties and those working with him had to encounter, they had found the remains of eight consecutive kings, and they had established the strongest guarantee that the history of that dynasty, so traced, was to be taken as correct. The *onus probandi* was thrown entirely on the other side, and we were bound to believe in its accuracy till it could be disproved. Professor Flinders Petrie described other discoveries, the whole of which were illustrated by photographs. These included a tomb of the third dynasty, containing, he said, the oldest specimen of the arch yet known.

VILLAS AT WESTGATE-ON-SEA.

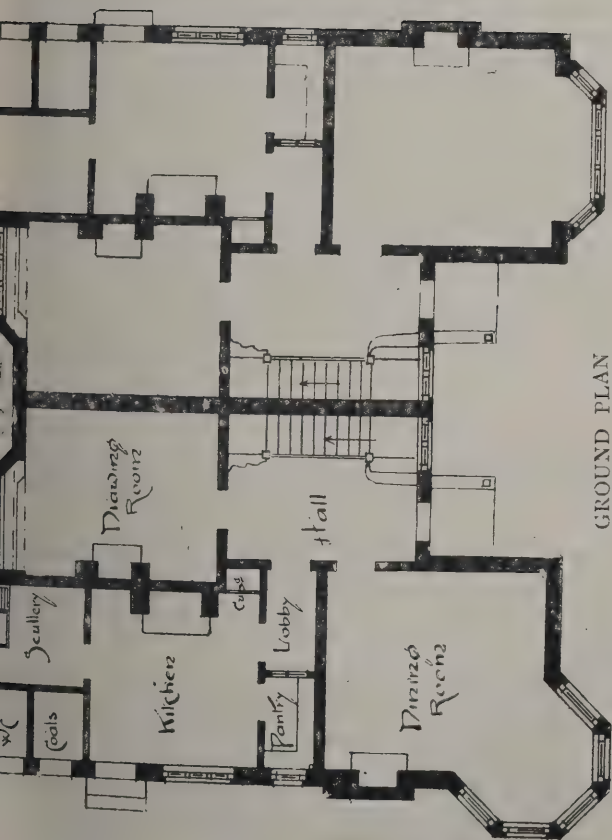

THE illustrations of proposed villas at Westgate-on-Sea for Mr. F. BOOLING, are by Mr. ALBERT C. FREEMAN, architect, London. They were intended to be built with red facing bricks to the lower elevations, and rough-cast plasterwork and vertical tile hanging to the upper part, the roofs being covered with Broseley tiles.

NOTES AND COMMENTS.

THE late Canon ISAAC TAYLOR, who died last week, aided archæology by his books. He exemplified the law of heredity in his ability, for he belonged to the family of the TAYLORS, of Ongar, and was related to several scholarly writers. In his twenty-fifth year he edited a translation of BECKER'S "Charicles," a book in which ancient Greek life is described in an attractive manner. His book on "Words and Places" is an interesting contribution to the etymology of local names. Afterwards he attempted to solve the mysteries which surround Etruria in his "Etruscan Researches." Then he took up a subject that appeared more simple—the alphabet—which occupied his leisure during several years. His later works were "Leaves from an Egyptian Note Book" and "Names and their Histories."

THE recent visit of the CZAR of Russia to Paris will be remembered by several architects, for they have received the distinction of the Order of St. Anne of the third class. Among those selected are MM. TROPPEY BAILLY, architect of the exhibition palace of ceramics and glass; AUBERTIN and UMBDENSTOCK, architects of palace of the Army and Navy; COUSIN, architect of the Pont Alexandre III.; RAULIN, architect of the Salle des Fêtes; LUCIEN MAGNE, Government architect and professor at the Ecole des Beaux-Arts; GASTON TRÉLAT, architect and professor; MEWES, architect of the palace for congresses. The announcements were received in Paris last week.

WE hope Mr. CARTLIDGE, the inspector of the Board of Education, is not too optimistic when in his last report he says:—"To-day it is a fact that the foreign designer is practically disappearing from the field in regard to British manufactures, though, of course, the cosmopolitan character of art will always bring the foreign designer in some degree into the work of any country. But the greatest influence the schools of art have exerted upon manufactures does not lie so much in the production of designers as in the training of a vast army of draughtsmen, painters, modellers, moulders, carvers, printers, gilders, fillers, chasers, glass-workers, weavers and other art workers who are concerned in the production, as a finished article, of the designer's creation. During the processes of production the conception of the artist runs risks of being spoiled by unintelligent artisans through whose hands it must necessarily pass. And here has been the greatest work of the schools from a commercial point of view, namely, that they have raised the general intelligence and taste of the class of workers referred to. This is unquestionable, as it is fully realised by the manufacturers themselves." It would be strange if, after half a century, the Government art schools did not exercise some influence on manufactures. Foreign designs are, however, still prized in many important cases, and, unless the advertisements are lies, traders find it is profitable to obtain goods which are manufactured abroad, for their customers have a weakness for them. That is not encouraging for English designers, and in course of time a more equitable arrangement is sure to prevail. But the foreigner has his chance as long as the prejudice exists against the art schools, which is to be debited to the inefficiency of the system adopted by the officials of the Science and Art Department. Their successors under the new Board are endeavouring to promote a better system of training, and the above quotation from the report is at least evidence that a change for the better is visible.

THE restoration of the chapel on the bridge at Rotherham is so important a work, for the structure is one of the very few survivals of its class in this country, we hope no division of opinion among the local authorities will cause a delay. The Feoffees of the Common Lands have obtained a report from Mr. JOHN BILLSON, of Hull, in which that architect said that the chapel possessed the distinction of being practically untouched, in which respect it differed from the chapel on the Bridge at Wakefield which had been rebuilt. The people of Rotherham, therefore, should consider themselves fortunate in the possession of such an interesting building, and should do everything they can to preserve it. Mr. BILLSON agreed with the advice received

from the Society of Antiquaries and the Yorkshire Archaeological Society about the preservation as far as possible of so interesting a relic. It is estimated that the cost of one portion of the work would amount to 850*l.* and of the second portion 550*l.*, or in all 1,400*l.* The Feoffees are willing to subscribe 500*l.* provided 1,000*l.* can be obtained from other sources. As a further recommendation it was proposed to make the restoration become Rotherham's memorial to Queen VICTORIA. The Mayor, however, does not approve of the combination, and also maintains that the funds belonging to the Feoffees should belong to the poor, and were never intended to pay for works of restoration. The fate of the chapel now depends upon the liberality of the townspeople. If they subscribe for the preservation of so interesting a relic we suppose the law will not be invoked to bar the Feoffees from contributing.

THE diocese of Ferns mainly consists of the county of Wexford. It is stated to have been founded by St. EDAN or MOEDOC at the close of the sixth century. At first the see was the archbishopric for the province of Leinster. Of the early buildings no trace remains. The Norman settlers landed in Wexford, and they soon became so powerful that a treaty was entered into at Ferns between the native princes for their expulsion. HENRY II., however, was able to keep Wexford in his possession, and the county formed part of the territory which STRONGBOW acquired by his marriage with the daughter of the Irish king. The Normans erected a cathedral in Ferns, and in the fourteenth century, JOHN ESMOND, the bishop, although deprived of his office by the Pope, was able to retain it by force of arms. The Norman cathedral was believed to have been destroyed by fire during an attack in the sixteenth century, and a commonplace building, which is still used, was built on the site. Of late years there has been more attention given to an investigation of the old and new parts of the cathedral. The chancel walls, with some beautiful windows, were thought to be the only remains of Norman work. In the course of recent explorations the clustered pillars of the old church have been laid bare, and they show that the present building is, in reality, the centre aisle of the original Anglo-Norman cathedral, which in ELIZABETH'S reign was fitted up for the new services by building up the arches and covering all—pillars included—with plaster, a barbarous arrangement which was perpetuated in the early part of the last century, when an addition was built to the cathedral soon after it had been made into a parish church, on the old parish church falling into decay. The Anglo-Norman cathedral must have been a fine building. The distance between the east end of the chancel and the newly-discovered pillars at the west of the church is 180 feet. There are vaulted chambers beneath the aisle. Within the church there is a recumbent figure in episcopal robes, long known as a monument to St. MOEDOC. From its general character it is considered by competent authorities to be a work of as early as the ninth, and certainly not later than the eleventh century. The restoration in progress is being carried out under the direction of Mr. FULLER, architect.

CATHEDRAL SERIES.—CHICHESTER: TOWER AND EAST END OF CHOIR.—TRIFORIUM, NORTH-EAST CORNER OF RETRO-CHOIR.

ROWTON HOUSE, NEWINGTON BUTTS, S.E.
FIRST FLOOR PLAN.—GROUND FLOOR PLAN.—BASEMENT PLAN.

THE subject of our illustration was fully described in a paper on "Rowton Houses" read before the Architectural Association, and reported in our issue of March 29 last.

In consequence of the demand for accommodation such as is to be found in these "poor man's hotels," it has been decided to enlarge the present building southward on land acquired for that purpose. Plans have been prepared by the architect to the company, Mr. HARRY B. MEASURES, F.R.I.B.A., and the work is to be proceeded with forthwith. The building, when completed, will have a total accommodation of 1,016 cubicles. We hope to illustrate the completed building in an early issue.

STAINED GLASS IN ENGLAND SINCE THE GOTHIC REVIVAL.

INCLUDING SOME ACCOUNT OF ECCLESIOLOGICAL PROGRESS, FROM 1860 TO THE PRESENT TIME.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays among French Cathedrals," &c.

(Continued from page 135.)

It is strange that while all the other arts subsidiary to architecture—painting, sculpture, wood-carving and metal-work—were making such progress during the decade of the revival comprised between 1850 and 1860, that of painting on glass should have remained almost stationary, little or nothing being done to effect its emancipation from mere antiquarianism. Barnett, of York, Beer, of Exeter, Gibbs, Hardman, Hedges, O'Connor, Oliphant, Wailes, Ward & Hughes, Warrington, Willement and Wilmshurst, the works of most of whom may be traced back to the very dawn of the Gothic movement, undoubtedly earned gratitude for their well-meant, not always successful efforts to rescue the vitreous art from a slough of despond into which it had been suffered to lapse during the Georgian era, could, when under strict architectural superintendence, produce really good things, but when left to their own devices they sank for the most part either into a feeble agreeable prettiness or into the absolutely commonplace. Indeed, the wretched mawkish attempts at picture painting in which some of our noblest ecclesiastical edifices seemed destined to become loaded, and which a too large portion of the public ignorantly believed in and cried up as something very fine, were truly appalling.

To the improvement of a church interior there is no more perturbable obstacle than a bad stained-glass window, for when authorities wish to remove it they are confronted in most instances by a hundred prejudices and sentimentalities, and in some cases by the fear of doing violence to better feelings. The representatives of the person or persons commemorated in the majority of such insertions ought, however, to be above prejudice, and must, after the interval of a generation, have that sensitiveness which would suffer by the removal of a

Some very creditable works of this artist may be seen in the north-eastern transept of Lincoln Cathedral.

The lancets in the chancel of Aylesbury Church, one of Sir Robert Scott's early restorations, are commendable productions of Oliphant.

The works of Warrington, which have not as yet been treated of in this history, would have been as successful as any produced since the revival had their author emancipated himself more completely from antiquation. Among some of his most praiseworthy efforts, certain specimens dating back into the early forties, the following are deserving mention:—The windows in the apse of Norwich Cathedral and of St. Chad's, Birmingham; the east windows of two churches in Warrington, St. Thomas and St. Peter; several in the aisles of Brompton Church; the east window of the Sub-deanery Church, Chichester; a series in the south-choir chapel of Truro Cathedral, and the west window of the north-nave aisle at Ottery St. Mary, executed under the superintendence of Mr. Butterfield. Some later specimens—in emulation of it would appear, of the Morris School—may be seen in St. Andrew's, Battersea, but they are far from successful; indeed, their author would have done well had he kept to the old paths in this instance, the church itself presenting few or no features alien to the English Gothic. In 1848 Warrington put forth a really sumptuous volume entitled "The History of Stained Glass, from the Earliest Period of the Art to the Present Time, illustrated by coloured examples of entire windows in the various styles," but it was practically useless, the "coloured examples" being selected, not from ancient specimens, but from the works, accepted and rejected, of the author. Such a volume, it need hardly be remarked, met with a most hostile reception from that merciless censor, *The Ecclesiologist*.

Hardman—from the long drilling which he, or rather his artist, John Bell, had under Pugin—was of all the glass painters at this epoch the most trusted to work exempt from architectural supervision. His merit, unless interfered with, was invariably hieratic, and his use of colour almost always pleasing, evidence of this being shown in the east windows of SS. Peter and Paul, Wantage, All Saints', Boyne Church, and St. Paul's, Herne Hill, and in the western ones of St. Mary Magdalene, Munster Square, and St. Michael's Collegiate Church, Warrington. Subsequently, however, Hardman's works seemed to lose the spirit of the old Puginic spirit, an over-refinement of pose and thinness of picture becoming their leading characteristic.

Perhaps no sadder example of such treatment is that presented by the three west windows of St. Wulfram at Grantham, each of its a typical specimen of Early Middle Pointed work.

memorial; and it would be a most graceful gift to the church in which they and theirs have worshipped for years past, and hope to worship for years to come, if they would themselves propose and aid in effecting the desired change.

Before the decade above alluded to had expired the names of several artists in stained glass, who were not only destined to occupy foremost places in their profession but to completely revolutionise this branch of ecclesiology, came before public notice, conspicuous among them being Messrs. Lavers & Barraud (now Lavers & Westlake), Clayton & Bell, Powell, Heaton & Butler, and Morris & Marshall—true artists, receptive of new ideas and really eager to produce beautiful objects. Of course upon some of their early efforts it is not possible to bestow unqualified commendation—excellence being of course only attained after much painstaking practice—but in the interests of our history it will be necessary to allude to such early works, occurring as they do in some of the most remarkable churches built in this country since revived interest in matters ecclesiastical.

The recent demise of Mr. James Brooks seems to offer a suitable opportunity for dwelling in the next few chapters of this history upon some London works of one of the most talented architects whom the "inventive" phase of the movement called forth, and as certain of these churches contain early, if not the earliest, specimens of Messrs. Clayton & Bell's work, we may not inappropriately commence our survey of this new and important era in the history of revived glass painting with some studies of those artists' productions.

To inspect these imposing specimens of the late Mr. Brooks's skill it is necessary for the ecclesiologist to betake himself to such north-eastern districts of the Metropolis as Shoreditch, Haggerston, Hoxton and Plaistow—dun-coloured regions where it may be safely averred the interiors of those noble edifices planted in their midst are the only bright spots in the envioning dreariness.

Since the revival of the true principles of Gothic architecture, perhaps, no more remarkable group of churches from one hand has been raised in England.

Each shows a decided predilection on the part of its architect for Pointed of an Early Foreign type—St. Michael's, Shoreditch, and St. Saviour's, Hoxton, having a somewhat Italian cast of physiognomy, while St. Columba's, Kingsland Road, and St. Chad's, Nichols Square, Hackney Road, with which may be classed St. Andrew's, Plaistow, and the Church of the Annunciation, Chislehurst, recall as their prototypes some of the grand edifices of that cradle of the First Pointed style, the old *Domaine Royale* and *Champagne*.

Raised without exception in poor and distressingly ugly neighbourhoods, the leading features of this group of churches—true town churches, not country ones come to town—are simplicity yet dignity and grandeur of elevation and contour; absence of elaborate detail and a tendency to abnormalism in certain forms, reminding us of Butterfield, though Mr. Brooks's eye for colour was always safer and more equitable; their almost entire construction in brick; and the thoroughly work-a-day look that pervades their instrumenta of worship.

Raised on the sites of humble mission stations planted in some of the poorest and most densely-populated quarters of London, each of these churches—built with the object of presenting the services of the Church of England in their grandest and stateliest aspect—is a splendid memorial of that spirit of unselfish liberality and devotion which has been quickened within her during the last half-century.

A few words explanatory of the origin of these churches may not be irrelevant.

The name of their late accomplished architect came prominently before the ecclesiological world about 1861 in connection with the masterly manner in which he had remodelled the parish church of Haggerston, completed in 1827 from the designs of Nash, and conspicuous from far and near by its tower, which uprears itself from the closely packed streets of its vicinity.*

At the time of the erection of Haggerston Church a number

* Engravings of St. Mary's, Haggerston, made shortly after its completion, appeared in the *Gentleman's Magazine*, the *Mirror* and *Metropolitan Improvements*. In those days the situation of the church was comparatively rural.

of droll stories were current respecting this tower, one of which ran as follows:—

When the tower was just about to be commenced, the builder applied to Nash to know how high he should carry it. Nash being busy at the time, and not having completed his plans, told him to go on building until he should tell him to stop. Next day the architect of

"He finds us all brick and he leaves us all plaster"

celebrity was called away into a distant part of the country upon a job which occupied him for some time. Returning, Nash bethought himself of Haggerston Church, and went to see how it was getting on. To his amazement he found that the tower had grown to the unnatural height which we now see, and on remonstrating with the builder, the latter defended himself by saying that he had only followed the directions given him, to go on building until he was told to stop, which he had not yet been told to do. Nash, thinking with St. Augustine that "*Plurima sunt quæ fieri non debitant, facta tamen valent*," contented himself with simply putting up four pinnacles, one at each corner of his Brobdingnagian tower, stood another tower of Liliputian proportions on top of it, likewise pinnacled, and so left it as we now see it.

Scarcely less ludicrous than this above *ben trovato* story—invented to account for what at first sight seems utterly unaccountable—is the true history of this preternaturally elongated tower.

Just at the time when St. Mary's, Haggerston, was in building (1825-27), Wanstead House—the mansion where had dwelt Long. Tilney Wellesley, Long Pole (afterwards Earl of Mornington)—was pulled down and the materials sold. The contractor for building the church bought these materials, which included a quantity of fine Bath stone, at a very low figure, and being desirous of realising his bargain as soon as possible, he told the building committee that he could afford to build a magnificently high tower at a very moderate cost. The committee, having considered his proposal, gave him an order to build them a tower as high as he could for the money they had to lay out upon it, and the result is what we see—that parody on the celebrated Boston stump which, viewed at dark from the neighbouring streets or looming through a November fog, has a really imposing air.

The church to which this—in spite of its wretched detail—substantial steeple and western façade is attached, was one of the worst and feeblest of that large number which, built in George IV.'s reign under the Million Act, have been provocative of much expense in adjusting them to the requirements of the Catholic revival. Two tiers of carpenter's Gothic windows in its brick walls, and ungainly pillars whose surfaces, worked into various hollows, gave them "a distant resemblance to clusters of columns," as the critic of the *Gentleman's Magazine* of that date informs us, were the leading features of a church built at a time when all true ecclesiastical features and decency seemed lost.

Such was the church Mr. Brooks was called upon to ameliorate the artistic condition of—the mother church of an immense district, which, cut off from the old parish of Shoreditch, was at the close of the "fifties" in so grave a state of spiritual destitution as to form the subject of a debate in Parliament. However, on the appointment in 1859 of a new incumbent—Rev. John Ross, now Vicar of Cainham, Salop—both the church and its services were revolutionised.

Splendid individual generosity was forthcoming, and the addition of a chancel to, and a rearrangement of the Georgian Gothic parish church with its wretched fittings was determined upon as a necessary first step towards the amelioration of the surrounding district.

At the time of the remodelling of St. Mary's, Haggerston, Mr. Brooks was but little known in the ecclesiastical world, but when the church was reopened on All Saints Day, 1861, pæans arose from those who were quick to acknowledge the boldness and skill with which the architect had grappled with what, at first sight, appeared a hopeless task. Indeed, the artistic results were only equalled by the moral ones, for whereas the church under its old régime was all but deserted, in its restored condition its services became thronged.

Shortly after several new districts, each equipped with the necessary machinery for evangelistic work, were created out of

the hitherto unwieldy old parish, and their chapels dedicated with great appropriateness to the three great British missionaries—Augustine, Chad and Columba. Subsequently another district was mapped out at the eastern extremity of the parish, neighbouring to, Bethnal Green, its church receiving the name of the proto-Martyr, St. Stephen. But with neither St. Augustine's nor St. Stephen's has this present history to do. The former was the work of the late Henry Woodyer, and has been described in a former series of these papers. The latter was from the hand of Francis Dollman, also of late years removed from the world of architecture.

Recurring to St. Mary's, the late Mr. James Brooks's work there embraced the re-roofing of Nash's old nave and the seating it with open benches; the formation within its last two bays of a *chorus cantorum* provided with low chancel and side screens, and an imposing pulpit of stone and marble, somewhat Italian in character and circular on plan; and the remodelling of the uncouth piers and arches into the best semblance of Middle Pointed obtainable under the circumstances.

For the more dignified performance of the altar service Mr. Brooks threw out a shallow sanctuary, Geometrical Decorated in style, having a coved roof of brick ribbed with stone and lighted by a window of five compartments—rather low and broad. Towards this Messrs. Clayton & Bell contributed some of the best glass executed by them, during this period—the subject, the Te Deum; the groups clear and distinct, the tinctures brilliant without rawness, and an hieratic feeling imparted to the whole without undue archaism.

Keeping his window high up in the wall Mr. Brooks was enabled to gain ample space for a dignified reredos, which, with its central cross of white marble, has quite a Butterfieldian air.

The new sanctuary being much less wide than Nash's nave, Mr. Brooks had recourse to that very charming feature, the "canted" bay, to mask the disparity in the dimensions of the two limbs. At that time this oblique bay was a novelty in ecclesiastical design, but besides making it a useful feature, Mr. Brooks was enabled to render it a picturesque one, piercing the lower part of the wall on either side with coupled arches of Italianising Pointed caste, and surmounting them with an unglazed Geometrical Decorated window. Behind this "canted" bay one compartment of Nash's nave was left, the angular space thus created being utilised for vestry and sacristy. The two tiers of Gothic windows with which Nash's nave was lighted were retained at the time of Mr. Brooks's ameliorations for a couple of years or so, when, together with the galleries, they disappeared. The lower row of windows was blocked up, and the carpenter's Gothic tracery of the upper ones transmuted into very good Geometrical Middle Pointed several being filled with stained glass, while the emancipation of the aisles from the galleries served to impart an appearance of much grandeur and religiosity to the pile, reminding one in some degree of Boston or Hull, or that grand Middle Pointed fragment, the nave of the Austin Friars Church near Broad Street.

Prior to the alterations the services at St. Mary's, Haggerston, were, as remarked just now, almost deserted, but on its reopening they became attended by large and devout congregations, and for some time were remarkable for the excellence of their choral accompaniment.

The organ at the east end of the south aisle is interesting. It is a Father Schmidt, and was originally built for and placed in St. George's Chapel, Windsor, after the Restoration. Here it remained until 1788, when George III., on the completion of the present instrument by Green in 1799, gave it to the parish church of Windsor.

On the rebuilding of that edifice about 1825, part of the organ was sent to Haggerston,* the rest finding its way to meeting-house at Long Melford. Some of Schmidt's work remained in the Haggerston organ, notably the woodwork which is particularly good. During the remodelling of St. Mary's it was removed from the western gallery under the direction of the late Mr. Henry Willis, restored and considerably enlarged, but its external appearance presents few features of interest.

* The writer of the article on Haggerston Church in the Supplement to the *Gentleman's Magazine*, vol. xcvi. part ii. (1828), concluding his description, remarks that "the choral service (performed by amateurs) is in general very interesting and attractive. The church is lighted by gas."

LIVERPOOL CATHEDRAL.

THE following letters relating to the style of the proposed Liverpool Cathedral have appeared in the *Times* :—

From Mr. Robert Gladstone.

As Mr. Reginald Blomfield, in his letter to you to-day, makes a personal reference to myself and to what I said at a recent meeting of our cathedral committee, I hope you will allow me to reply to him through your columns that, while Classical architecture has naturally been the prevailing style in the South of Europe, Gothic in one form or another has been almost universally adopted for ecclesiastical buildings in this country. May I remind Mr. Blomfield that all our cathedrals, with the single exception of St. Paul's, are Gothic, and an overwhelming majority of our parish and other churches are in the same style? So strong is the general feeling in favour of Gothic for our churches that I have little hesitation in saying that, if the style for our cathedral had been left open, nine-tenths of the designs submitted by architects would be Gothic. In support of this opinion may I remind Mr. Blomfield that in the previous competition for a Liverpool Cathedral in 1884 the second and third premiums were gained, with the approval of our assessor, Mr. E. Christian, by Gothic designs, and the first prize, given to Mr. Emerson, was for a design specially calculated to be in harmony (so far as possible) with the adjoining Classical buildings?

As regards the effect on the eye and mind, let me quote what the late Sir Gilbert Scott said in an address to the Institute of British Architects regarding Westminster Abbey, viz. :—

"A building which does not owe its claims upon our study to its antiquarian and historical associations, intensely interesting though these must be to every man worthy of the name of an Englishman. It has claims upon us architects—I will not say of a higher, but of another character—on the ground of its intrinsic and superlative merits as a work of art of the highest and noblest order; for there are few churches in this or any other country having the same exquisite charms of proportion and artistic beauty which this church possesses; a beauty which never tires, and which impresses itself afresh upon the eye and the mind, however frequently you view it, and however glorious the edifices which, during the intervals, you may have seen."

Such, sir, is the type which we have adopted for our cathedral. Is it an inferior one? Can Mr. Blomfield suggest a nobler one? If he can, let him at once tell us what it is, and, the interest not only of Liverpool but of our country, give us an opportunity to consider it.

I have not forgotten that the early Christians converted the available basilicas into churches, nor do I forget how the apse with its railings became the chancel of later times. I have been a student of architecture for forty years, and am not ignorant of the rise and fall of Gothic architecture, of how it emerged from the clumsy grandeur of Norman, attained its most sublime beauty during the 100 years to which I referred, and then by the elaboration of pretty details it gradually deteriorated until architects in despair called in the more sturdy accessories of the Grecian and Roman orders to revivify their expiring art. After awhile this Classical resuscitation passed away, to be succeeded by a revival of Gothic, wretched enough for many years, but now better understood and exhibiting in many places much of the spirit of our old cathedral buildings.

We are told that Gothic is again passing away. It may be so; but what do our leading architects offer us in its place? At present it may be truthfully asserted that no new style of architecture has been invented, unless it be the glass and iron construction of the Crystal Palace; and in these circumstances feel that if we take the interior of Westminster Abbey as our guide in building Liverpool Cathedral we shall follow the most beautiful and most devotion-inspiring example of church architecture that this country affords. In conclusion, I say to Mr. Blomfield, "Si quid novisti rectius istis, candidus imperti; non his utere mecum."

From Mr. Reginald Blomfield.

I must apologise for trespassing on your space again, but it is due to the courtesy of Mr. Gladstone's letter that I should answer his challenge. The number of issues he raises is somewhat bewildering. He adheres to the position that Gothic is the only possible style for a cathedral. He quotes Sir Gilbert Scott on Westminster Abbey, and he asks me to supply him with a new style in architecture. The dilemma which I put before him he has not attempted to answer—perhaps it is unanswerable; but he remarks incidentally that, had the design been left open, "nine-tenths of the designs submitted by architects would be Gothic," to which I need only reply that it depends on the architects. The authority of Sir Gilbert Scott, moreover, will hardly convince contemporary architects, but Scott was a very able man. Whatever his practice he knew good work from bad, and in the quotation which Mr. Gladstone

supplies us he praises Westminster Abbey, not for its historical associations, nor for its fitness for modern necessities, but solely as a beautiful work of art in itself. So far as any relevance to modern thought is concerned Mr. Gladstone might just as well have quoted Professor Cockerell on the Parthenon.

But the points at issue between architects and the committee are more serious than this. In the first place, there is the general question of the restriction to any style at all; in the second place, the restriction to Gothic, and even Gothic of a certain specified period. Now, in restricting designs to any style at all the committee have misapprehended the work and duty of an architect. The popular conception of an architect is that he is a man who sits down and makes pretty drawings, or if he does not, employs somebody else to, that he hands these over to the builder, and that this, artistically, is an end of the matter. Of the underlying process of thought, of the careful consideration of all the bearings of the problem, of the deliberate selection of one out of many experiments of the imagination that every architect worthy of the name must go through before he puts pencil to paper, the committee seems to have had no sort of suspicion at all, for they blandly undertake the preliminary process themselves and inform architects that their designs are to be Gothic, and even English Gothic of the thirteenth century. Architects may, and probably will, form an entirely different estimate of the situation. They may think that an architectural language which has long since died a natural death is inadequate to express the teeming thought and emotion of modern life. In any case, whether they do or do not, they would probably be unanimous in agreeing that this essential function of the expert should not be taken out of his hands. Architecture is a serious art and not the mere plaything of cultivated amateurs, and I think it improbable that any architect properly so called would undertake such an enterprise as this with his hands tied. In the second place, we come back to the old question, Why "Gothic?" Mr. Gladstone reminds me that all our cathedrals are Gothic "with the single exception of St. Paul's"—truly a formidable exception. May I also remind Mr. Gladstone that at the date when those cathedrals were built no other style was possible or even dreamt of, and hence the admirable sincerity and individuality of these cathedrals—qualities which the most ardent classicist will readily admit. But what are we to say now, when the whole world of "styles" is open to a designer? Is there any sincerity of expression in reproducing a dead language?—for that is the serious intention of the committee's resolution—and even if Gothic architecture did express the thought and feeling of a number of people, it is quite certain that it does not express the feeling of everybody.

There are those, and it is possible that they are not a minority, who would find the dome of St. Paul's Cathedral at least as suggestive of religious thought as the clerestory of Westminster Abbey, for, after all, a cathedral is not a church adapted to one particular congregation, or to one particular shade of theological opinion. A cathedral, one would think, should provide for all shades of thought and opinion that may fairly meet within its walls, and one cannot protest too strongly against this narrow identification of religious worship with one particular phase of architecture.

Mr. Gladstone asks for a "style," but we are sick of styles. Nowadays every man must think for himself, and nobody reaches style unless he can carry his own individuality into the expression of his thought.

The less, therefore, we hear of styles the better for architecture; but if Mr. Gladstone really wants a model for the cathedral of the future let him look for it among the ruins of the Baths of Caracalla at Rome.

From Mr. R. Gladstone.

In the letter from Mr. Blomfield which you publish to-day I do not find any actual recommendation or suggestion of the form or kind of architecture which he thinks we should adopt for our cathedral. Mr. Blomfield says that Gothic has died a natural death, and at the same time he says that, "If I really want a model for the cathedral of the future I should look for it among the ruins of the Baths of Caracalla at Rome." But, then, why not also in the ruins of the Parthenon at Athens; or in the Temple of the Sun at Baalbec, or among the colonnades of Palmyra and Persepolis, or in the temples of ancient Egypt? All these were suited to the times and places in which they were built, but I think Mr. Blomfield would not really choose one of them as a model for an English cathedral.

The great central room in St. George's Hall, Liverpool, is said to have been designed from one of the *thermæ* at Rome, and as a place for public ceremonies and musical festivals it is magnificent, but it would not be suitable for a church. Indeed I do not hesitate to say that Italian architecture is not suited to ecclesiastical buildings in this country, for which we prefer our national Gothic. In proof of this may I point to the cathedral at Truro, the new cathedral at Edinburgh, and the splendid church lately built by Mr. Austin at Stockport, all of which are Gothic?

Mr. Blomfield says, "We are sick of styles, and every man must think for himself." This is what the committee for building Liverpool Cathedral are doing. They are bold enough to make up their minds as to what kind of a cathedral they prefer to have, and they do not wish to be dictated to. If they are really acting unwisely, why do not their critics point out the better kind of architecture which should be adopted? No one has done this yet, unless Mr. Blomfield's reference to the Baths of Caracalla is to be regarded as a serious recommendation.

It is possible, perhaps, that in some quarters a hope is entertained that in an unlimited and unrestricted competition something would turn up which might prove to be an entirely new and completely satisfactory design for a new cathedral; but what reason is there for expecting this? Is it not much wiser to adopt the kind of architecture with which our devotional feelings are so closely entwined, leaving its details and accessories to the consideration of the specially trained architect to whom this most important work will be entrusted?

From Mr. William Emerson.

My attention has been drawn to a remark in Mr. Robert Gladstone's letter, published in the *Times*, dated the 15th inst.

He stated that of the competitive designs of 1884 those placed second and third by Mr. Christian were "Gothic" designs, while the first, Mr. Emerson's, was for a design specially calculated to be in harmony (as far as possible) with the adjoining Classical buildings.

The meaning this implies is that mine was not a "Gothic" design, or at any rate that is the impression his words would convey to those who do not know.

I wish to say that my design was "Gothic" in principle, plan, construction and detail, though of an early phase, for the reasons I clearly laid down in my report (pages 9 and 10).

The introduction of the dome no more militates against its Gothic character than the dome of Sta Maria del Fiori at Florence militates against the Italian Gothic style of that church.

The fact of the Classic surroundings on the former site was not the only reason for the dome, but also the fact that it is the only logical covering for an enormous open area in front of the choir, which is demanded by modern congregational requirements.

The particular phase of Gothic selected was because the larger and broader detail would have been less in contrast to the large scale of the Classic work in proximity to it than the smaller detail of a later period, and also because sculpture and other details could be made more nearly approaching the highest class of work than could be possible without incongruity with the restrictiveness of Gothic of a late period.

Were the design translated into later detail, which could easily be done, it would still be Gothic, but of a different phase.

As I have no intention of competing a second time my only motive in writing this is fairness to myself, because I am aware that persons antagonistic to anything but fourteenth-century detail have been good enough to state that mine was not Gothic, which is untrue in every sense of the word. We have examples of it in a number of our own cathedrals, as I pointed out in my report, and notably in the best part of Canterbury.

Mr. T. G. Jackson, R.A., writes:—

To one who remembers in his student days the battle of the styles over the Law Courts and the Government offices, it is curious to hear the old war cries raised afresh in a day when purism in architecture is no longer accepted as the prime ruling motive.

Mr. Robert Gladstone's arguments are those of fifty years ago, and his opponents' views seem so novel to him that he fails to understand them. It is no reply to Mr. Reginald Blomfield, who says, "We are sick of styles; every man must think for himself," to say that Mr. Blomfield does not actually recommend or suggest the form or kind of architecture he thinks proper for the new cathedral. That is only to complain that Mr. Blomfield does not do himself what he objects to Mr. Gladstone and his committee doing. The fact is that architecture has happily begun to emancipate herself from the shackles of precedent and authority, and if the committee insist on retaining them they will not get what they should have—the best that modern architects can do for them.

I, too, say that the new cathedral must be Gothic. But the point is, What do we mean by Gothic?

To me, here in England, it means freedom of design, independence of precedent, conformity to conditions of climate, material habit, convenience and the general requirements of England and Englishmen. These are the motives with which our forefathers worked and by which they evolved the Gothic art of the past. It is only by working in the same spirit as they, not by copying the mere letter of what they did, that we may hope to rival them in the future.

This, however, I fear, is not what the Liverpool committee means by "Gothic," but rather that blind following of Mediaeval example which I should call not Gothic at all, but pseudo-Gothic.

In this I hope I may be mistaken. But, in justice to those whom they invite to compete, the committee should at least make it clear to the public what they themselves understand by Gothic. For instance, as there is no instance of a true dome in Mediaeval Gothic, would they condemn a design with a dome as violating the conditions? Or, again, must all the arches be pointed, and would a round-arched building be voted out of court? Must the plan be that of our old cathedrals, as in the case of Truro and Edinburgh, which Mr. Gladstone quotes with approval, and would any original plan stand self-condemned? With these and a hundred similar pitfalls in the field no competitor could walk safely except along the narrow path of precedent, and any original excursion would be fatal.

No good can possibly come of this narrow policy. The new Liverpool Cathedral offers an opportunity that may not recur for centuries of giving English architecture a lift upwards into new life and expression. It would be a national misfortune if those in whose hands the future of the scheme lies should fail to seize it through timidity and prejudice.

Let them simply offer the site and the opportunity, and invite English architects to do their best, and if they do not get a good design English architecture is in a worse case than I believe it to be.

Mr. Reginald Blomfield again writes:—

The Liverpool committee are in deep water and seem unable to get out of it. Mr. Gladstone, who acts as their spokesman, is simply confusing the issues in his letter to you of October 21. In answer to my suggestion that a hint for this cathedral might be found in such buildings as the Baths of Caracalla, Mr. Gladstone asks, Why not also in the Temple of Baalbec or Palmyra or Persepolis—or, for the matter of that, of Timbuktu? To Mr. Gladstone's imagination all these buildings present themselves as so many different collections of details, and he thence not unnaturally concludes that they would be quite unsuitable for the purpose in hand; but this is what comes of not seeing the wood for the trees. Probably in any one of these buildings a competent observer would find motives (not details) of design which he might translate into a totally different expression, and this is what I suggested when I referred to the Baths of Caracalla. Elmes found one motive of design here, and expressed it somewhat literally in his splendid room at St. George's Hall; but other architects might find other motives in the fragments of the tremendous vaults and arches of the ruins of Imperial Rome. It seems impossible after fifty years of Ruskinism to drive it into the head of the layman that architecture is not sculpture or painting, but architecture. It may seem a paradox to Mr. Gladstone, but I only state a fact when I say that there are architects nowadays who design in Classical architecture, and yet are inspired by the Gothic spirit as truly, so far as it goes, as any of the Mediaeval experimentalists of the thirteenth century, and these are the men with whom, as Mr. Reilly pointed out, lies the architecture of the future.

The point, as Mr. Jackson shows with admirable clearness in the *Times* of to-day, is, What is Gothic? Is it that wizened old mask of detail under which for the last fifty years the architectural ability of the country has very nearly been suffocated by the ardent amateur, or is it that free, adventurous spirit in design which declines to be tied down by formula, and seeks for its realisation in the simplest and most direct expression of the purpose in hand, subject only to the restraint of knowledge and to the condition that the result should be dignified and beautiful to the eye? It is this latter spirit, call it Gothic or by any other name, which inspires all that is best in contemporary English architecture and which is the real representative of all that has been best in the past architecture of this country; and it is against this spirit that this ill-considered resolution of the Liverpool committee is aimed. The committee have hardened their hearts in their iniquity. They made a bad start in 1884, and they seem to be making a worse one now, for there is not a single essential point in their proposals which has not been adversely criticised by all competent professional opinion. Their sensitiveness to dictation and their violent attempt to put back the clock suggest the state of mind of that humble but obstinate animal who, sooner than give way to his driver, fell over the precipice.

It is yet to be hoped that the committee may think better of it. There can be no doubt that they are sincerely anxious to obtain a cathedral worthy of one of the first commercial cities of the world. But they have gone to work in a way exactly calculated to defeat their object. As Mr. Jackson puts it, "Let them simply offer the site and the opportunity and invite English architects to do their best." It is due, not only to their subscribers, but to the interests of the art of this country, that they should not handicap their enterprise at the start.

ARCHITECTURAL ASSOCIATION CLASS OF DESIGN.

THE preliminary meeting of the Architectural Association Class of Design was held on Tuesday, the 15th inst., at 9 Conduit Street, W., Mr. W. H. Seth-Smith, president of the Association, in the chair.

The object of this school is to assist students in the study of design. The classes being under the direction of visiting architects, a practical knowledge of the work is thus gained. Students are not required to submit elaborate studies, but only tinted working drawings in pencil, showing, however, very clearly the subject specified, by plan, section and elevation.

Mr. J. Macvicar Anderson, in speaking of the importance of such a class, said they were all students of architecture, but he in one respect had the advantage of most of those present, inasmuch as he had lived a few years longer, and had therefore studied the requirements of the art with the greater facility that time afforded. They, however, possessed the distinct advantage over him in being at the outset of their career, with all the attractions of their art before them and the promise in honest work of influencing the architecture of a new century. They would perhaps find there was little interest taken in architectural design outside their own profession, because the general and wrong acceptance of the term implied the front of a house. The back of the house seldom entered into consideration, whereas the backs of houses were matters of great importance to architects. Architectural design did not consist merely in designing the front elevation, but in successfully planning all external and internal features. The most important point in architectural design undoubtedly was planning. Many men would disagree with him on this matter, but the speaker held a distinctly opposite view to their argument. Planning was artistic as well as utilitarian. It did not signify whether the projected structure was to be a palace or a country house, a municipal building or a cottage; the first consideration was to arrange the plan conveniently and so well that the requirements of the individual cases would be easily met. In country house planning it was necessary to place the dining-room in proper juxtaposition to the servants' offices, and in public buildings to afford easy access from one part to another. These essential particulars were too often totally disregarded in the planning of both public and domestic buildings. Originality in design was a source of danger to the young architect, and though the speaker did not wish to put any sort of drag upon the genius of students, caution, he said, was necessary before breaking away from established rules. It was the natural tendency of the student to do this, no matter how long such rules had been recognised. The five orders in architecture followed certain rules, and it was maintained impossible to improve upon the proportions governing them. Sometimes it was necessary to modify the proportions of columns and pilasters, but to hastily set aside long established rules was foolish. Art rested upon immovable foundations, but he was sorry to say there were students of the present day who, not content to take the ruling of past ages, designed for themselves forms both ugly and grotesque. Individuality was only legitimate when introduced without sacrifice of beauty. The charm of a pediment was its overhanging hood, but nowadays much of the effect was destroyed by setting back the pediment. The treatment of the arch was in present times often false, whereas properly employed nothing could be more beautiful. The great rule in architecture was to design in purity, and to get this quality the work must have simplicity. In important public buildings symmetry was the invariable rule. In conclusion, Mr. Anderson urged the architectural student to set before him in all work a lofty ideal. The artistic work of architects called for as lofty an ideal as that which encouraged the spiritual life, and unless the student set a really lofty ideal before him, he would not rise much above the ordinary level in his work. The architect's aim should be great, not satisfied at first sight with that which appeared good, but to be critical and severe. To be as critical of his own work as he was of the efforts of others, and with such a spirit in design there was for the young student the prospect of his improving the architecture of the age in which he worked.

Mr. H. H. Statham in commencing his address urged them not to accept the view that architecture at the present time was a dead art. It was not so, unless they chose to make it so. The position of architecture was as good now as it was at the Renaissance, or at any time since then. Those who declared that architecture was only the craft of building, and could only become real by giving up all details of former times and by architects betaking themselves to building with their own hands, were seeing imaginary difficulties and providing imaginary remedies for them. It was impossible for us by an exercise of will to free ourselves from the influence of the past, and it was equally impossible for the architect to become an actual builder; he must in any case have assistants, and would then be director of works, as he was now. So far from architecture being a mere craft spoiled by the Renaissance, it might even be argued that the Renaissance theory of

architecture was the higher one, since it made architecture an intellectual problem instead of a mere craft. On the other hand, it was a mistake to try to galvanise architecture into life (supposing it to be dead) by eccentricities and vagaries of design under the name of originality. These things would only be interesting as long as they were new; as soon as the novelty was worn off they would lose all their value, and the picturesque, in any case, was not the true object of architecture. The picturesque meant that which was imperfect, exaggerated or unbalanced. The best art was that which was a complete whole. A building, for whatever purpose designed, should be the expression of one dominant idea, pervading, first, the plan, and expressed with the same completeness in the design. With such an aim it was possible to make a building really an original conception, even if the details were not original. Indeed, anyone who set out on the design of a large building, saying to himself, "I will have all new detail designed by myself," would either find it impossible to carry this out or he would design a good deal of very bad detail merely for the sake of being different. But it was in his power to make a building a new conception in plan and design. And in this matter of unity of conception there was much to be learned from the great Renaissance architects. Their detail might be bad and conventional—much of Wren's was—but with both Inigo Jones and Wren the general conception of a building was almost always fine and consistent with itself—an architectural whole. Inigo Jones's design for the proposed Whitehall Palace was a notable example of this greatness and unity of conception—unity coupled with the effective variation introduced between the square court in one wing and the circular court in the other, which, however, were not allowed to interfere with the external symmetry of the great court. As far as we could judge by the one portion erected, the Banqueting-house, the architectural detail might seem to be cold and commonplace to be carried all over so vast a building; but that did not impair the grandeur of the plan, which no detail could kill. And it might be added, in reference to those who were always reminding them that drawing was not architecture, that it was nevertheless a means of expressing an architectural conception; and that Inigo Jones was a greater architect than he would otherwise have been thought in virtue of this plan, which had never been carried out, but which remained on paper to excite our admiration and emulation. No mere "craftsman" could ever have risen to such a conception. The same principle of striving to make each design a distinct and complete idea, instead of merely putting rooms together irregularly, might be equally carried out in small buildings such as ordinary-sized houses. Giving an example of an old house which possessed real individuality in plan, but which was carelessly and imperfectly carried out in elevation, he would urge them in studying old buildings not to be ready to admire everything in them just because it was old, but to judge of them on their merits, just as they would a modern building; this was a great deal more profitable than blind admiration, which too often became blind imitation.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of this Institute was held on the 15th inst. in the rooms, Pitt Street, Mr. John James Burnet, A.R.S.A., F.R.I.B.A., president, in the chair. The Secretary read the thirty-third annual report, from which it appeared that during the past session there was added to the roll of honorary members Sir James D. Marwick, LL.D., from whom an acknowledgment was duly received expressing his appreciation of the honour thus conferred upon him by the Institute. On the other hand, there had been removed from the honorary roll, by his death during the year, Mr. John Burnet, F.R.I.B.A., father of the President, and himself an ex-President of the Institute. Mr. Burnet had reached the venerable age of eighty-seven years, and was held in the highest esteem by all who knew him. He was one of the original members of the Institute, was long a member of Council, and held the office of President from 1876 to 1878. The Council had also to deplore the loss to the profession caused by the death during the year of the following distinguished architects, viz. Wm. Young, J. M. Brydon, Arthur Cates and James Brooks. During the year three names had been added to the roll of ordinary members, of whom there were now seventy-two on the roll. The membership was thus keeping pace with the increase of the profession in Glasgow and the West of Scotland, and included nearly all within the district of the necessary standing and qualifications. The usual exhibition of R.I.B.A. prize drawings was held during the fortnight commencing April 1, when there were also exhibited the drawings which gained the Institute prizes in the School of Art and Technical College.

The following were the winners of the Institute prizes this year:—School of Art (first prize), Mr. James W. Hepburn; (second prize), Mr. Wm. Ferguson; Technical College, Mr. Robert Muir M'Kissock. The Council agreed to renew the prizes of five guineas to the School of Art and two guineas to the Technical College. One of the outstanding events of the year was the visit to Glasgow of the R.I.B.A., which took place on October 3 and 4, and the Council were pleased to be able to congratulate the Institute on the assurances they had received that it was regarded by the visitors as one of the most interesting episodes in the history of the Royal Institute. The executive committee of the Exhibition authorised the expenditure of a sum not exceeding 35% on the architectural photographs at present being exhibited in the Fine Art Galleries, and it was arranged to order two sets, one to remain the property of the executive and the other to belong to the Institute. It is intended that those now brought together, illustrating the architecture of Glasgow from the cathedral to buildings of very recent times, will form the nucleus of a larger collection, in which all the works of architectural importance of Glasgow and the West of Scotland will be included.

The Chairman, in moving the adoption of the report, said the year had not been without its share of responsibilities, but he believed the Institute was becoming more and more aware of the exact nature of its responsibility as one of Glasgow's corporate bodies, and was becoming recognised as capable to advise in its interests. It was with pleasure that he had to record the very kindly reception which had been given to the circular which was issued in the early part of the year soliciting from the members some financial support for the building fund of the college. Though the direct response to that circular was insignificant, he had called on several members since with the most satisfactory result. That an institution offering educational facilities not only in the practice of architecture but in all crafts—he would not say depending for their position on architecture, but largely depending for any artistic development of their practice on the profession—should not, in the constituent parts of its governing body, include architects, seemed a gross error, but he believed that this was being recognised by those in authority, and that it might ere long be put to right. In their relation with the tradesmen, or craftsmen, as he preferred to call them, they had endeavoured to hold their position as neutrals, and though they had not given that prompt response to their request to consider with them a form of contract, it was primarily because it was felt that little should be done to interfere with the liberty of each man, either on the one side or the other, to enter into such a form of contract as might seem to him most suitable in the particular circumstances, and, above all, it was particularly necessary, in a large industrial and commercial centre like Glasgow, to avoid anything that might be looked upon as purely parochial, and might militate against the freedom of tendering by those who were outside their boundaries. In skill their craftsmen had nothing to fear from outside competition, and they could best help them and their clients to a clear and concise contract by clear and concise drawings and descriptions of their designs. The Institute had again endeavoured by revising its suggestions for competitions to make them more useful to the public, and likely to result in abler men submitting designs, but it had done so only as recognising the competitions as a seemingly necessary evil, and hoping that the public would ultimately recognise that it was not the best way to get "light and leading," and that the only ultimate competition amongst those who were to be their advisers was the competition amongst men in their daily work to earn their confidence, and not by a submission of their work which, from its very nature, if it was to be of any real use to them, could only be judged under expert advice. The Institute was convinced that architecture, in the true sense of the word, could only be good when it was the result of close personal consultation between the architect and his client, between whom the structure would grow consciously fit for its purpose and unconsciously artistically effective. One of the most interesting events of this year's work had been the position which the Institute felt itself obliged to take in reference to the reconstruction of one of Glasgow's most important public and charitable institutions. It was with very great regret that the Institute felt obliged to bring the result of the Royal Infirmary competition before the public of Glasgow, and seemingly to stand in antagonism with that body of gentlemen who so freely and generously gave so much of their time to the public service connected with the management of such institutions; but surely if the Institute had any public duty whatever to perform it was that of placing before the public any matter within its technical knowledge in which it felt they were being misled. No personal regard for such gentlemen should be permitted to influence its expression of opinion. In this instance the question was a very vital one, and one in which the public were entitled to the very best technical advice that could be obtained. What the Institute pleaded for, and asked the public to demand, was that such technical advice should

be taken before they (the public) were led to support a scheme which, in its opinion, if carried out as at present proposed, could only lead to a very heavy first cost, enormous annual expenditure and gross inefficiency for the purpose in view.

The Council for the ensuing year was elected as follows:—Messrs. Alex. Petrie, John Jas. Burnet, James A. Morris, David Barclay, W. Forrest Salmon, A. N. Paterson, John Keppie, H. K. Bromhead, James Lindsay, N. Macwhannell, Campbell Douglas, T. L. Watson, J. M. Monro, Alex. M'Gibbon, A. Balfour, Jas. Miller (who has since resigned) and John A. Campbell. Mr. John Keppie was elected a representative on the joint house committee. The treasurer's accounts, which were submitted and approved of, showed that the funds were in a satisfactory position. A vote of thanks to the chairman terminated the proceedings.

AN EARTH HOUSE IN ORKNEY.

IN the course of the past summer there has been reopened on the farm of Grain, near Kirkwall, a most interesting example of the class of subterranean buildings known in Scotland as "earth houses." It is situated within half a mile of the town of Kirkwall and on the property of the Marquis of Zetland. The excavations were carried out, by permission, by Mr. James W. Cursiter, the local antiquary, who contributes the following notice of it to the *Scotsman*:—

There are no details regarding the first discovery of this building, except a remark in the late Mr. Petrie's notebook, furnished to me by Dr. Joseph Anderson, to the effect that it was about the year 1827. The probability is that about that time it was accidentally discovered by the plough coming in contact with some of the upper stones of the entrance, or in the course of some other agricultural operations. When Mr. Farrer visited Orkney in 1857, Mr. Petrie and he together reopened the building, and wrote a short descriptive account of it. The opinion formed at that time was that the cell must have been a place of concealment beneath a broch, and the walls are said by them to have been found in a ruinous condition. Scottish archaeology has made rapid strides in the last half-century, and, as I was anxious to see it for myself and preserve the memory of this almost forgotten relic, I determined to locate it, and, if possible, assign it to its proper position among our antiquities which may be seen and studied. In the search, trenches were dug from 3 to 5 feet deep, about 250 feet in length altogether having been excavated. Two small enclosures were found, constructed of flag-stones placed on edge, but with no masonry to support them. There were no traces of the remains of a broch encountered, nor anything worthy of the name of building, except the one to be described. Signs of habitation, however, were everywhere visible—remains of ruined walls, shellfish and fish bones; bones of sheep, ox, boar and whale; deers' horns, stone pestles, saddle querns and recessed stones. Some of the bones had been formed into implements, and there were a few fragments of clay pottery and charcoal discovered. About 18 inches below the surface one of the lintels to the entrance was discovered, revealing the fact that in trenching we had passed over the structure without discovering its existence owing to its depth, the entrance having been built so much higher than the rest of it. The structure extends for about 36 feet in length, from south to north, and is entirely underground; it consists of the entrance at the south, a gallery or passage in the middle, and a chamber at the north end. The entrance consists of two compartments nearly 3 feet square each, and 6 and 7 feet high, divided from each other by lintelling below and masonry above, the building of the southern one on its south side being very confused, possibly from its having been entered from that end on one of the former occasions, and roughly closed up. The northern compartment seems to have had two doorways, one on the east and one on the west, the east one being only 2 feet 9 inches high, while the lintel of the one on the west is 6 feet above the floor level.

The gallery is on the north side of this compartment, 2 feet 5 inches wide by 2 feet 6 inches high at its south end, and 2 feet 7 inches wide by 3 feet 9 inches high at the inner end, and is about 18 feet long. It has a slight curve to the right, and gentle descent throughout its length. The side walls are well built, but the stones of which it is constructed present a great diversity in size, some being very large and water-worn, the others small by comparison. The gallery is roofed by large water-worn stones laid crosswise over the walls. The chamber is of an oval shape, 13 feet in extreme length and 6 feet 6 inches in extreme width, with varying height according to the lintelling, the greatest being about 5 feet 9 inches; there is very little convergence in the walls, which are built of comparatively small broken stones, there being a remarkable absence of water-worn ones. In the south-west corner of the chamber one piece of yellow sandstone (free-stone) occurs, which is evidently the lower stone of a saddle-quern; the most remarkable feature of the

chamber is the fact that the roofing is supported by four massive pillars, each pillar consisting of a single water-worn block of stone placed on end, supplemented when required by small ones placed on the top of them. Resting on these, with their other ends built into the nearest side wall, are other stones forming cap-brackets. Over these cap-brackets are placed heavy lintels lengthwise and crosswise of the building, these lintels serving to support the roofing, which consists of heavy water-worn stones, laid chiefly crosswise, some being laid flat and others on their edge. The entire erection is founded on the original surface of the rock, which forms its floor, and has here a very considerable dip to the north-west. There is a descent of about 9 feet from the surface to the entrance floor-level. The dip of the rock continuing throughout the gallery and chamber makes the inner end of the chamber about 12 feet below the present surface of the ground, which presents no indication of the presence of such a building in the neighbourhood. The building is constructed entirely of the common sandstone of the district, and shows no signs of tooling. Its erection must have entailed a considerable amount of forethought, trouble and painstaking work. At present it seems to be encased with very hard boulder clay about 4 to 7 feet deep, with a covering of 5 feet of earth, except the entrance end, the top of which is only about 1 foot below the surface. An examination of the outside of the structure, however, was not made. The entire building is in a perfect state of preservation.

Examination of the interior revealed no trace of ventilation, drainage or fire, but showed that infiltrated mud had at one time covered the floor of the chamber to a depth of 18 or 20 inches. There was considerable accumulation of mud and stones in the gallery, which got finer and smaller towards the inner end. This also characterised the rotten rock surface of its floor, which I slightly excavated in the centre lengthwise, partly for drainage and to afford easier access to the interior. In selecting a proper niche in Scottish archaeology for this building, I am compelled to class it under the category of earth houses so faithfully described by Dr. Joseph Anderson, who says:—"They are mostly situated in arable land, and now under cultivation, having long, low, narrow galleries, always possessing a certain amount of curvature, always widening and increasing in height from the low and narrow entrance inwards, usually built with convergent walls and roofed with heavy lintels, which are always lower than the surrounding level of the ground, so that the whole structure is subterranean." Few of these earth houses have yielded relics, but in consequence of these articles which have in the course of their excavation been discovered, they have been relegated to a comparatively recent period, viz. the beginning of the period of the Roman occupation. I am loth to accept such a late date for the erection of this building; the mixture of megalithic and microlithic art displayed in its architecture is more characteristic of the age of stone than of any succeeding period in our archaeology. As little is known of the purpose for which they were constructed as of their date, it is meantime merely a matter of reasonable conjecture. Probably they have, like almost every building of antiquity, in their time played many parts. I do not entertain the ideas of hiding holes, or winter residences, which have been suggested, but am inclined to the opinion that this structure must have been erected as a tribal or family burial vault. Since it was opened I have repeatedly observed that after even moderate rainfall the water accumulated in the inner end of the chamber to a depth of from 9 to 12 inches, while in comparatively dry weather there have been but few days on which there has not been continual dripping from the roof and trickling down the walls. Walls and a roof have been constructed over the entrance and a door with lock and key provided, so that interested people may have the opportunity of examining this, the most perfect specimen of its kind known. A temporary arrangement has been made by which Mr. Twatt, the tenant of the farm, who has the key, will allow facilities for seeing it, and it is to be hoped that the proprietor may see fit to make provision for its permanent preservation and usefulness.

PUBLIC ACCESS TO STONEHENGE.

At a meeting of the Amesbury Parish Council, held at Amesbury on the 16th inst., the following resolution was passed and forwarded to the Amesbury District Council and the Wiltshire County Council:—"This Council, being strongly of opinion that an obstruction has been placed at Stonehenge, thus interfering with the free access hitherto enjoyed by the public, and this opinion being generally sustained by the public at large, as confirmed by the Press, the said Council desire to enter a strong protest against the said obstruction, and to express upon the District Council the urgent necessity for the reconsideration of their opinion communicated to the Amesbury Parish Council on March 23 last. The Council also desire to

state that a copy of this resolution, as well as a copy of that forwarded to the District Council on February 28 last, will be forwarded to the County Council as well as to the public Press." The resolution of February 28 referred to was as follows:—"This Council, having had its attention called to the obstructions which have been placed across the carriage-tracks, by which from time immemorial the public have had access to Stonehenge, desire to obtain the opinion of the District Council as to whether the owner is within his rights in having such obstructions so placed."

TESSERÆ.

Protogenes the Painter.

It is said by Pliny that Protogenes was originally in very poor circumstances, and that it was not known from whom he received instruction. He did not produce many paintings, in consequence of the long time and great labour which he devoted to each. Quintilian says that "cura" was the distinguishing characteristic of his paintings, and Apelles is said to have remarked that Protogenes did not know when to take his hand from his pictures. Of all the paintings of Protogenes the most celebrated was the one called *Talysus*, upon which he is said to have been engaged seven years. Pliny says that he lived during the time he was painting it upon moistened lupines, and also informs us that each colour was laid on four times. A dog in this painting, which was represented panting and foaming at the mouth, was greatly admired. It is related that Protogenes was for a long time unable to represent the foam in the manner which he wished, till at length, disheartened by repeated failures, he threw his sponge at the mouth of the dog, which accidentally produced the effect he had been endeavouring to obtain. The fame of this painting was so great that Demetrius Poliorcetes, when besieging Rhodes, did not set fire to that part of the city where Protogenes lived lest he should destroy the picture. Aulus Gellius, in relating the same circumstance, says that Protogenes was dead and that the painting was preserved in a public library outside the walls of the town. In the time of Pliny it was preserved in the Temple of Peace at Rome. Among the other paintings of Protogenes mentioned by Pliny was a portrait of the mother of Aristotle, who advised him to paint some of the exploits of Alexander the Great. Paintings of Alexander and of Pan were among the last of his works. Pausanias also mentions a painting of the Thesmophetæ by Protogenes, which was preserved at Athens in the senate house of the Five Hundred. Protogenes is always mentioned by the ancient writers in terms of the highest admiration.

Landscape Art.

In Italy when the churches became full, sublime or sacred historical painting was on the decline. The art reverted to mythology, to ancient fable, and ideal landscape arose—at first subordinate to a story—but it soon became not only the principal and the story, but an ornament, an adjunct. Some cold historical painters, indeed, went on with their history, the object of which was the figure; but the soul, the sentiment, was gone. The genius of Italy could not bear this, and broke out in a new school of landscape, and the works of those days are the most precious ornaments of the best collections. Landscape, however, soon declined from its higher state—composition, scenery, both the more elegant and the free pastoral, gave place to effects, to more accurate studies of the more minute parts of nature, till these minute parts became the whole, and at length character, excepting of individuality of bits of nature, was abandoned. The earth, as it was made, was neglected for the earth as man made it—the lowest subjects, skirts of villages, banks of canals, cattle and man in all the servile offices of toil became the desiderata of painters and admiration of connoisseurs. These often exhibited, it is true, great talent, wonderful skill in the management of colours and execution, the fascination of which, if it did not cover the vulgarity of the subjects, excused it; yet were there intermediate painters who, not abandoning themselves to the low nor aiming at the high, chose neutral or perhaps pleasing scenes as the subjects upon which to show their skill and management of those minor principles of art which are common to all subjects, to all schools. In these there was always a richness of colour, a breadth, a mellowness, so that the eye, if there had been no subject whatever, would have been gratified. From these painters, to our own Wilson and Gainsborough, landscape sunk, was totally lost, first descending to unmitigated vulgarities, undefended by any beauty, and became contemptible. The attempts of Lambert and Smith of Chichester to revive it were unfortunate; they were devoid of genius, nor was Wright of Derby as a landscape painter very much in advance of them. Some of Gainsborough's smaller pictures were very beautiful in colour and effect, and the subjects; if not high, pleasing, but he had no

enlarged conceptions of landscape, and in his after style, wherein his execution was totally out of character with his subjects, and his colour unmeaning and dirty, his pictures are probably the most unpleasing that can be offered to the eye of an admirer of nature. Nothing shows his poverty of genius in landscape so much as his published sketches, and yet such is the innate love of nature they were in their day highly esteemed and brought large prices. When the clockmaker was enabled to fix his watch in Gainsborough's village church-tower, and exhibit the toy in the shop-window, he did not so much degrade the painter as afford a practical satire upon his choice of landscape. We speak of a certain time of Gainsborough's pictures, for though we do not think he had any peculiar genius for landscape, some of his smaller wood scenes, evidently from nature, are very charming.

Cantilever Scaffolding.

In a report by Telford on the passage of the Menai Strait, printed in the Parliamentary Papers for 1811, a novel plan is proposed for the centreing of very large arches, especially adapted for situations in which, from the nature of the bottom, the rapidity of the current, or the great elevation of the bridge, a centreing put up from below would be impracticable. It was suggested for the erection of an iron arch of 500 feet span at Ynys-y-Moch. Telford proposed that the masonry of the abutments should be carried up to the level of the roadway, and surmounted by four massive frames, about 50 feet high, placed at the same distance apart that the ribs of centreing were to be. The centreing was to be formed of a number of trussed frames, fitting together like the stones of an arch, these frames being 25 feet deep at the sides, and gradually diminishing to 7 feet 6 inches at the crown of the arch. The first set of these frames of centreing were to be put up by means of scaffolding secured to the abutments, and supported by horizontal ties set in the masonry, and iron rods suspended from the frames at the top of the abutment. On the first portion of centreing thus put up a flooring was to be laid, on which the second set of frames could be moved forward. These being laid upon the first set in an inverted position were to be hinged to them by a contrivance resembling the joint of a carpenter's rule, and then turned over until their ends abutted against the ends of the first set. Suspension rods being then extended from the ends of the second set to the frames on the abutment, the flooring was to be extended, and a third portion of the centreing moved forward and fixed in like manner. Thus the centreing would be suspended from the abutments, and when completed it would have the strength of an arch, as well as that of the suspending rods, to enable it to support the superstructure.

Michele San-Micheli.

With many merits the designs of San-Micheli often exhibit glaring faults, which, if he had confined himself entirely to the study and practice of civil architecture, he would perhaps not have fallen into. In fact, the best of his palazzi and other works of that class are far from being models, except as to their façades and exteriors, being most inconvenient in their plans, besides abounding with monstrous deformities, such as rooms quite out of square, and sometimes with no two sides parallel; and in one instance (Palazzo Bevilacqua) he has placed the principal staircase in an open court without any protection whatever from the weather. His exterior architecture exhibits less of mannerism and more both of invention and nobleness of taste than that of Palladio, but also not a little that is decidedly faulty and offensive. Almost all his buildings are marked by a disagreeable inequality of design, there being a singular mixture of parts highly enriched and others nakedly plain in the same composition. His balustrades to windows and pedestals to columns are too high, and in more than one instance he has raised his columns on a second pedestal over the first one. His style shows itself to most advantage in his lofty rusticated basements, which generally possess an air of dignity. Among the palazzi erected by him are the P. Grimani and the P. Cornaro à S. Paolo at Venice, and the P. Canossa, Bevilacqua, Verza, Pelligrini and Pompei at Verona. In Verona he also built the church of the Madonna di Campagna and the much-admired Cappella Pellegrini.

Architects and Building Committees.

SIR,—I shall be obliged if you will allow me space to bring the following case before your readers, in the hope of some professional brother being able to aid me with his experienced advice in the matter. The case is this.

After making drawings for the extension of a modern church, and the greater part having been carried out satisfactorily, the building committee order their architect to copy seats of another architect, which he declined to do.

The committee, through their secretary, get the builder to make models entirely different to their architect's design (which formed part of the contract), and had their design put into execution, on learning which the architect immediately sent in his resignation, considering himself to have been superseded.

The committee decline to pay the balance due for services up to the time of rupture, and threatens counter-claim for damages for non-completion of work, which they contend the architect had undertaken to see completed.

Architect would be glad of advice from any professional brother who has been similarly placed, or references to any cases bearing on this.

ARCHITECT.

October 21, 1901.

GENERAL.

The Royal Academicians have selected "Saul and the Witch of Endor" as the subject for this year's competition in historical painting. In landscape the subjects are "One of the Bridges over the Thames in London" and "Cumulus Clouds over a Fen Country."

A Collection of Paintings by Mr. N. Hone and Mr. J. B. Yeats, both members of the Royal Hibernian Academy, forms an exhibition which was opened in Dublin on Monday last.

The Glasgow Institute of Architects have elected the following officials for the coming year:—President, Mr. John James Burnet, A.R.S.A.; vice-president, Mr. Alexander Petrie; auditor, Mr. W. Forrest Salmon; secretary and treasurer, Mr. C. J. MacLean.

The Chapel of the Guild of the Holy Cross, Stratford-on-Avon, is to be restored. It dates from the reign of Henry VII., and was erected by Sir Hugh Clopton. It belongs to the Corporation.

The West Houghton District Council (Lancs) have decided to erect public offices and to obtain a design by competition. The accommodation to be provided will consist of a large public hall on the second floor, two committee-rooms with ante-rooms, a couple of offices (each) for the clerk, surveyor, district-rate collector and overseers and poor-rate collector, one office for the School Board, one for the relieving officer, one for the Council's nuisance inspector and the medical officer of health, store-room, waiting-room, caretaker's apartments, &c. The estimate of cost is not to exceed 4,000*l.* to 4,500*l.*, including furniture and architect's fees.

Mr. Silvanus Trevall, who was mayor of Truro in 1894-95, is likely to be again elected to the office for 1901-2. He possesses special qualifications for the duties.

Mr. Edwin O. Sachs will open the discussion on "The County Council and the Safety of Theatres" at next Wednesday's meeting of the O. P. Club.

Mr. C. Hawksley will deliver his inaugural address as president of the Institution of Civil Engineers at the meeting on Tuesday, November 5.

The Statue of the late Mr. Gladstone in Albert Square, Manchester, which was unveiled by Mr. John Morley on Wednesday, was modelled by Signor Raggi. It is 9 feet 10 inches high.

The Lady Chapel of St. David's Cathedral was, after restoration, dedicated on Tuesday by the bishop of the diocese. The ceiling of the lady chapel collapsed 130 years ago. The work of restoration has occupied about a year, and has cost 2,500*l.*, and its accomplishment is due to the unflagging efforts of Dean Howell. The chapel had to be practically reconstructed, and the ante-chapel has also been paved and repaired according to plans by Mr. John Oldrid Scott, who succeeded his father, the late Sir Gilbert Scott, as the cathedral architect.

The Glasgow Corporation have agreed to expend 400*l.* on reproductions of ancient Irish art objects which are now being exhibited in the Fine Art Galleries.

Mr. Carnegie has given 37,000*l.* to Dundee for the erection of four free libraries.

The Marquis of Bute on Wednesday laid the foundation-stone of the new municipal buildings and law courts at Cardiff, of which Messrs. Lanchester, Stewart & Rickards are the architects.

The Late Mrs. Janet Smith or Rodger, by her will directs her trustees to hand over to the Town Council of Glasgow, to form part of the collection of pictures in the art galleries at Kelvingrove, ten paintings which belonged to her late brother, Mr. David Adam Smith.

The New Offices of the Mutual Life Insurance Company of New York.—In the description of the above building in our issue of October 11, it should have been announced that the very handsome ceilings under the gallery and over the main hall, and also the wall tiling to the stairs, were executed by the Burmantofts branch of the Leeds Fireclay Company.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER" Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BEXHILL—Nov. 23.—The Bexhill Urban District Council invite competitive designs for laying-out about 12½ acres of land as ornamental grounds. Premium of 20% offered for the selected design. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BEXHILL—Nov. 23.—The Bexhill Urban District Council invite competitive plans for an isolation hospital. Premium of 25% offered. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

CAMBERWELL—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CONTRACTS OPEN.

ARGENTINE REPUBLIC—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

ASKAM-IN-FURNESS—Nov. 28.—For erection of new Primitive Methodist Sunday schools, and heating same and existing chapel. Rev. W. Carr, minister, Slater Terrace, Dalton-in-Furness.

ASTON MANOR—Nov. 4.—For main buildings, offices, foundations, chimney-shaft flues, &c., required for their proposed electric-power station, for the Aston Manor Urban District Council. Council Offices, Aston Manor.

BEDFORD—Oct. 29.—For erection of a wash-house, &c., at smallpox hospital. Mr. John Lund, borough surveyor.

BETHNAL GREEN—Oct. 29.—For supply and erection of one Allott & Paton's improved Washington Lyons steam disinfectory, with all the necessary buildings, fittings, &c., at the infirmary, Cambridge Heath, N.E. Mr. D. Thomas, clerk to Guardians, Bishop's Road, Bethnal Green, N.E.

BLACKPOOL—Oct. 30.—For erection of a portion of the new church of St. George, Stony Hill, Blackpool. Mr. H. Goldsmith, architect, 63 Faulkner Street, Manchester.

BOOTLE—Oct. 31.—For enlargement of the Bedford Road Board school, Bootle. Mr. Thomas Cox, architect, 11 Dale Street, Liverpool.

BRADFORD—Oct. 28.—For erection of three shops, North Parade. Messrs. Samuel Jackson & Son, architects, Tanfield Chambers, Bradford.

BRENTFORD—Nov. 6.—For erection of an isolation hospital, with administrative buildings, &c., at Clayponds Lane, Brentford. Mr. Arthur Ramsden, surveyor, Town Hall, Chiswick.

BROCKLEY—Oct. 31.—For erection of a sorting office for postmen at Brockley, for the Commissioners of H.M. Works and Public Buildings. Mr. J. Wager, H.M. Office of Works, Storey's Gate, S.W.

CAMBRIDGE HEATH—Oct. 29.—For erection of an Allott & Paton's improved "Washington Lyons" steam disinfectory, with all the necessary buildings, fittings, &c., in connection therewith, at the infirmary. Mr. D. Thomas, clerk to Guardians, Bishop's Road, Bethnal Green, N.E.

CARDIGAN—Nov. 1.—For erection of new laboratory and fittings at the county school, Cardigan. Mr. James Stephens, clerk, 3 Green Street, Cardigan.

CARLISLE—Nov. 2.—For construction of underground lavatories in the Market Place, Carlisle, for the Corporation. City Engineer's Office, Carlisle.

CHALFORD—Oct. 28.—For erection of an infants' school at Chalford Hill, Glos. Mr. V. A. Lawson, architect, 17 Rowcroft, Stroud.

CHELTENHAM—Oct. 30.—For erection of a town hall on the winter garden site. Messrs. Waller & Son, architects, 17 College Green, Gloucester.

CLEATOR MOOR—Nov. 12.—For erection of a new butcher's shop, slaughter-house, hanging sheds, &c., at Cleator Moor. The Central Office of the Cleator Moor Co-operative Society, Ltd.

CORNWALL—Nov. 6.—For new joinery and renovating the Wesleyan chapel, Portreath. Mr. Sampson Hill, architect, Redruth.

CUDWORTH—For erection and completion of a workmen's home, caretaker's house and shop at Cudworth. Mr. Geo. Moxon, architect, Barnsley.

DARLINGTON—Oct. 28.—For joiner and plumber's work in connection with the construction of a ladies' lavatory in the covered market, for the markets committee. Borough Surveyor's Office, Town Hall, Darlington.

DARLINGTON—Oct. 28.—For construction of a ladies' lavatory in the covered market. The Borough Surveyor, Town Hall, Darlington.

DARTFORD—Nov. 12.—For the supply and erection at the sewage pumping station at Dartford of two sets of steam-engines and vertical three-throw piston pumps, and the removal

SYSTEM OF
Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,
147 QUEEN VICTORIA STREET, LONDON.
GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

of the present engines and pumps. Mr. W. Harston, surveyor, High Street, Dartford.

DEAL.—Nov. 13.—For construction of an additional engine-house, boiler-house and coal store at their pumping station, Upper Deal, for the Deal and Walmer Joint Water Board. Messrs. T. & C. Hawksley, civil engineers, 30 Great George Street, Westminster, S.W.

DEVIZES.—Nov. 5.—For building hospital (twenty-two beds in all), for the Devizes joint isolation committee. Messrs. Bell, Withers & Meredith, 3 Salters' Hall Court, Cannon Street, London.

DEVONPORT.—Oct. 28.—For erection of a new building for disinfecter, and additional wing to the infectious diseases hospital, near North Prospect, for the Devonport Town Council. The Borough Surveyor, 30 Ker Street, Devonport.

DEWSBURY.—Nov. 2.—For arching over and inverting a portion of the Dewsbury Beck, adjoining the site of the proposed covered market, for the Corporation. The Borough Engineer, Town Hall, Dewsbury.

DONCASTER.—Nov. 2.—For erection of a classroom at the Stainforth schools. Mr. H. B. Thorpe, architect, Goole.

DURHAM.—For erection of eight tenement houses at South Moor Lane, Stanley, R.S.O. Mr. T. E. Crossing, architect, Front Street, Stanley.

EASTBOURNE.—Oct. 28.—For construction of two public conveniences and alterations to existing shelters on the Grand Parade. Mr. R. M. Gloyne, borough engineer, Town Hall, Eastbourne.

GREAT YARMOUTH.—Oct. 29.—For construction of carshed and boundary wall, Caister Road. Mr. J. Wm. Cockrill, borough surveyor, Town Hall, Great Yarmouth.

GRIMSBY.—For erection of stores on the fish docks. Mr. G. W. Parker, Fish Dock Road, Grimsby.

HACKNEY.—Oct. 28.—For erection of three workshops and outbuildings at Cassland House, Cassland Road, N.E. Mr. A. W. S. Cross, architect, 58 Conduit Street, Regent Street, W.

HEST BANK.—Nov. 3.—For erection of a brick bungalow. Mr. John Greene, architect and surveyor, Meeting House Lane, Lancaster.

HOLBECK.—For erection of a weaving shed at Holbeck. Messrs. Walter A. Hobson & Co., architects and surveyors, 82 Albion Street, Leeds.

HORBURY.—Oct. 28.—For erection of Council offices, stable buildings, cart-sheds, fence walling, &c., Horbury, Yorks. Messrs. Walter Hanstock & Son, architects, Branch Road, Batley.

HULL.—For erection of a theatre, George Street, Hull. Mr. Thomas Guest, architect and surveyor, Cobden Buildings, Corporation Street, Birmingham.

HULL.—Nov. 5.—For erection of offices, King Edward Street and Savile Street, Hull, for the Lancashire and Yorkshire Railway Company. Mr. Henry Shelmardine, architect, Hunt's Bank, Manchester.

ILFORD.—Oct. 29.—For supply and erection of a water-tube boiler, with fittings, pipework, &c.; a 550-kw. steam dynamo (vertical enclosed high-speed engine), and a main switchboard and connections. Mr. John W. Benton, clerk, Council Offices, Ilford.

ILFORD.—Nov. 12.—For erection of tramway car-sheds, workshops, &c., for the Ilford Urban District Council. Mr. H. Shaw, 7 Cranbrook Road, Ilford.

IRELAND.—Oct. 28.—For supply and erection of electrical plant and apparatus for the town of Limerick. Mr. William M. Nolan, Town Hall, Limerick.

IRELAND.—Oct. 28.—For works for the Great Northern Railway Company (Ireland), viz. stationmaster's house at Moira; cottage at Broomhedge, near Belfast; coal store at Cookstown. Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Oct. 28.—For renewal of portion of the roof over the Belfast passenger station, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Oct. 31.—For erection of a central creamery at the Low Bridge, near Kilfinane. Mr. J. C. Bennett, Kilfinane, co. Limerick.

IRELAND.—Nov. 2.—For erection of mortuary chapels, caretaker's house, boundary walls, pillars, gates and railings, and for drainage, forming walks and grave spaces, &c., at the new cemetery at Ballycraig, Larne. Mr. W. G. Young, clerk, Town Hall, Larne.

IRELAND.—Dec. 2.—For erection of assembly buildings at Fisherwick Place, Belfast. Messrs. Young & Mackenzie, Belfast.

Such as Weaving Sheds, Engineering Workshops, Railway Stations, Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric-Light Works, and Horticultural Buildings of every description, &c. &c.

(FULL SIZE.)

A—Zinc or Copper Cap.

B—Brass Bolt and Nut.

C—Asbestos Cord.

D—Steel Bar

This System allows for full expansion and contraction of glass and absorbs any vibration from machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

ESTIMATES AND DETAILED DRAWINGS SUPPLIED ON APPLICATION.

"SYPHON" CLARK'S PATENT GAS STOVES.

FOR USE WITHOUT A FLUE.

The Most Improved System for Heating and Ventilating Private Houses and Public Buildings.

EMIT NO SMELL. GIVE NO SMOKE.

NO DIRT OR TROUBLE.

NO DANGER.

Mr. D'O'LEY CARTE, of the Savoy Theatre, writing of these Stoves, says:—"I used your Hygienic Gas Heating Stoves in this Theatre all last winter, and found them in every way most satisfactory. I think I must have had ten or a dozen of them in various parts of the Theatre, and in the very cold weather we had last winter they succeeded in warming the corridors, &c., admirably. Two of them were used to heat the Business Offices of the Theatre, and they fulfilled this object capitally, while apparently in no way injuring the air in the offices—a most important consideration."

Illustrations and full particulars to be obtained of all Ironmongers and Gas Engineers, and of the Patentees and Sole Makers—

S. CLARK & CO., "Syphon" Works, Park St., Islington, LONDON, N.

ELECTRIC NOTES.

A NEW bridge being necessary before the electric cars at Hull can travel down to the piers, there has been much discussion in and out of Council circles, and the Hull Chamber of Commerce, at a special meeting, resolved that they saw no objection to the making of a permanent bridge, providing facilities were given by a canal for the passage of lighters.

PLANS of the new tramway it is proposed to construct by the British Electric Traction Company through a portion of Soothill Upper were placed before the district authority at a meeting on Monday. In answer to a question, it was stated that the company intended to lay a double line from Dewsbury to Birstall if the necessary power could be obtained. It was decided to pass the plans conditionally upon the substitution of granite for local stone between the rails.

THE electrical equipment of the Union Street section of the tramway system is now about to be taken up by the Aberdeen Corporation. Until that is accomplished none of the outlying districts can be furnished with a speedier means of locomotion than horse traction, and the general feeling is that the latter is not only the slower but also the costlier method. Reports by

the burgh surveyor and the electrical engineer have been submitted to the tramways committee. The conversion of the route to the electric method of traction is estimated at about 5,000%.

TRADE NOTES.

THOMAS CRAPPER & Co. have been honoured with an appointment as sanitary, warming and ventilating engineers to His Majesty the King. They held a similar appointment when he was Prince of Wales.

THE Workmen's Home, Craigneuk, Motherwell, has been ventilated by means of Mackay's patent direct-acting louver ventilators of an ornamental design, supplied by Cousland & Mackay, ventilating engineers, Glasgow and Manchester, the sole makers.

THE public hall and Council offices, Grange-over-Sands, have lately been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, employing their "Rahnee" radiators and "Rex" radiator valves, and patent "Tubular" exhaust ventilators.

BUILDING AND BUILDERS.

A PIECE of land has been obtained at Llandrindod Wells for the erection of a Roman Catholic church and presbytery.

THE Market Hall, Denbigh, is to be converted into a public hall according to plans by the borough surveyor, with the approval of the Town Council.

LARGE offices are to be erected in Cockspur Street, W., for the Canadian Pacific Railway Company, on a site between the Union Bank and Sun Insurance Office.

A NEW lighthouse is in progress at Beachy Head, which will require another year for completion. It will be 120 feet high. Much difficulty was encountered in laying the foundations.

SKETCH plans by a member of the Council for fire station public baths, surveyor's and other offices have been submitted to the Hayward's Heath Council. It was resolved to complete the plans and prepare specifications before the next meeting.

CATHEDRAL SERIES.—CHICHESTER: TOWER AND EAST END OF CHOIR.—TRIFORIUM, NORTH-EAST CORNER OF RETRO-CHOIR.

ROWTON HOUSE, NEWINGTON BUTTS, S.W.
FIRST FLOOR PLAN.—GROUND FLOOR PLAN.—BASEMENT PLAN.

THE Education Department have approved the plans selected by the West Bromwich School Board for the new schools to be erected on the Lodge Estate. The work will be proceeded with as soon as possible.

A SERIOUS accident happened on Saturday morning at a new Board school which is being built in Blackpool. Five of the workmen were coming down the brick lift when the balance weight went wrong, and the men fell a distance of nearly 40 feet. Two were seriously injured, and were removed to the hospital. The others were taken to their homes.

THE new offices of the Gloucester Workmen's Benefit Society opened lately are considerably larger than the ones previously used. The whole of the work has been carried out to the design and under the superintendence of Mr. W. B. Wood. The total expenditure in connection with the building, including the purchase of the site but not including furniture, amounts to 3,000/.

IN the recent competition for the Trowbridge and District Joint Isolation Hospital, to be built at Trowbridge, Wilts, the designs of Mr. J. Hugh Goodman were selected for the first premium, and adopted by the committee for the erection of the hospital, in accordance with the recommendation of the professional assessor. There were over fifty designs submitted in the competition, which was an open one.

MR. J. S. BRODIE, the Blackpool borough surveyor, after visiting the principal watering-places of England and the Continent, has presented his report and suggestions as to the best form of sea wall for Blackpool, and the extent of the promenade widening. He recommends a solid wall of nearly upright or curved face, and is in favour of 100 feet widening. This will permit of a promenade 78 feet wide, a carriage-way 40 feet, tramway 17 feet, and two footways.

SIR H. CRAIK, K.C.B., on Friday last formally opened the Kingsland school, Peebles, erected at a cost of 12,000/ (including furnishings). The school is designed with a large central hall, with various classrooms entering from it and with teachers'

rooms, &c. The total accommodation is for 728 pupils. The exterior elevations are treated in simple English Renaissance style suited to a school building. The school was built to designs by the late Mr. Robert Wilson, Edinburgh, and completed under the supervision of Mr. J. A. Carfrae, architect, Edinburgh.

COLONEL A. C. WEST, R.E., held a Local Government Board inquiry at Birkenhead into an application by the Corporation for sanction to borrow 7,628/ for the purchase of 16,715 square yards of land bounded by Cleveland Street, Vittoria Street, Corporation Road and Verner Street, for the purpose of a depôt for the borough surveyor's department. Mr. Alfred Gill, town clerk, explained the scheme, and said the Council had approved of it on the recommendation of the road and improvement committee. He said it was possible that some time the Corporation might erect their own stables on that site.

AT a meeting of the asylum committee of the Cardiff Corporation on the 17th inst. the architects of the new borough asylum attended and gave particulars of the progress made with the plans up to date. It was explained that if there was no hitch of any kind the committee would be in a position to invite tenders for the execution of the work in September of next year, this being two months earlier than the original estimate of the architects. The architects stated that if the committee desired the contract could be divided—one for the foundations and the other for the superstructure, in which event the committee might advertise for tenders for the foundations in February next, the result being that the completion of the entire work would be facilitated by six or seven months. This question will be considered at a later meeting.

A DISPUTE has arisen among the joiners at Barrow in connection with the rebuilding of the pier which was burnt down last summer. The contract is in the hands of Messrs. Gradwell & Co., who have been employing a large number of shipwrights to do the work. The joiners claim that this is a class of work that belongs to them. Several meetings have taken place between the Master Builders' Association and the representatives of the men, but as no agreement could be arrived at, all the joiners in the employ of Messrs. Gradwell have been called out. How far this will affect all the other joiners in the town is not known, but the masters threaten that unless a satisfactory settlement is made they will lock out all the house joiners. This will be a serious matter, inasmuch as the building trade at the present time is extraordinarily brisk.

The POLICYHOLDER'S COMPANY

A POLICYHOLDER'S TESTIMONY.

In acknowledging the receipt of a Cheque for £3,883 6s. 5d. in settlement of Endowment Policy No. 453396 for £3,000, owing a bonus of nearly 3 per cent. per annum for 10 years, the Policyholder writes:—

"Had I taken a fully paid-up Policy instead of the above amount in cash it would have been £257 in excess of the figures given to me when I took out the Policy 10 years ago. I have given expression to my satisfaction by taking out a fresh Policy in your Company for £10,000 on the Endowment plan."

D. C. HALDEMAN, General Manager.

COLONEL A. G. DURNFORD, R.E., held an inquiry on the 16th inst. on behalf of the Local Government Board into an application by the St. Helens Corporation for sanction to borrow 30,000*l.* for the construction of the new reservoir at Brown Edge and 3,140*l.* for the purpose of making and improving various streets, including Elephant Lane, Marshall's Cross Road, Nutgrove Road and Kirkland Street Bridge. Mr. G. W. Bailey, town clerk, said part of the money was required for the purchase of land for the widening of Elephant Lane, and the rest of the 3,140*l.* for paving, &c. Speaking with regard to the reservoir, the town clerk stated that the Corporation could borrow 150,000*l.* for waterworks purposes, and of this sum 94,274*l.* remained unaffected by previous applications. The land for this reservoir had been secured at 1*s.* 6*d.* a yard freehold, which was quite reasonable in view of the fact that in 1868 the land for the existing reservoir and softening works was bought for 1*s.* 8*d.* a yard, while land in the locality had recently changed hands at 2*s.* 6*d.* a yard. The water engineer (Mr. J. J. Lockland) then explained the scheme, and the inquiry was concluded without opposition being offered.

VARIETIES.

WE are requested to state that Mr. W. Church Howgate, A.R.I.B.A., has, owing to the expiration of his lease of Perchard House, Gower Street, W., removed to 10 Sackville Street, Piccadilly, W., as from the 22nd inst.

THE new pathological laboratory at the Oxford University Museum, which has been erected at a cost of upwards of 10,000*l.*, has been opened.

THE Coventry Corporation have adopted plans prepared by Mr. Swindlehurst, the city engineer, for the construction of an arcade leading from Smithford Street to the Market Hall, at the estimated cost of 3,000*l.*

MR. H. BISCHOFFSHEIM has presented to the London County Council photographs of several paintings exhibited recently at the Whitechapel Art Gallery. The originals are by Canaletto, Boydell, S. Scott and E. Dayes, and formed a series representing places of interest in London in the latter part of the eighteenth century.

THE Sunderland Corporation have been refused by the Local Government Board power to borrow 20,000*l.* to purchase the Victoria Hall and site, and add additional buildings for a

public hall and other purposes. The Board are of opinion that the objects do not come within the scope of the Municipal Corporations Act.

IT is proposed to restore the ancient Cloth Hall at Newbury as a memorial of Her late Majesty Queen Victoria. The necessary steps are being taken to secure the building for the town with the object of having it fitted up as an art gallery and museum. The estimated cost is 1,500*l.* or 2,000*l.*, and there is every prospect of raising the necessary subscriptions.

THE Ripon City Council decided last Friday to purchase for 5,000*l.* the drill field site from the Marquis of Ripon for the erection of baths and pump-room, and for the laying out of pleasure-grounds in connection with the Spa scheme. The land put in offer includes not only the drill field but the adjoining museum, houses and gardens, the entire area being 3½ acres.

MR. WALTER LONG visited Hull for the purpose of opening the first of a series of new streets, which in the centre of the city will take the place of a considerable amount of slum property. At the request of the Mayor, the right hon gentleman severed a ribbon stretched across the street, which is 80 feet in width; and, after declaring the new thoroughfare open, named it King Edward Street.

THE Maidstone Urban District Council last Monday adopted a new scheme on the bacterial principle for the treatment of the borough sewage. The scheme will involve an expenditure of 72,000*l.*, exclusive of land. Mr. James Mansergh, who prepared the report, has been retained as engineer to carry out the scheme, and to prepare the necessary particulars, plans, specifications, &c, and to support the application to the Local Government Board for their sanction to the same, and to the loan which will be required.

FOR several months past a movement has been on foot to establish a district highways surveyors' association for the county of York. A meeting of all district highways surveyors in Yorkshire was called in September last, and it was unanimously decided to form an association purely for district highways surveyors. A council of management was elected and several council meetings have since been held, the last being last week, at Leeds, when a code of rules was adopted and the association became an established fact. One of the main objects of the association is to get through Parliament a Bill giving district highways surveyors tenure of office under Local Government Board control.

LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c. Cost of the Winch covered in a few weeks.

This Machine will be found invaluable in Warehouses, Factories, Maltings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building.

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and Safety.

AN offer has been made to erect a monument over the historic well of St. Bede at Monkton village, the work to be carried out at a cost of not less than 50*l.*, and not more than 100*l.* The erection will consist of four stone pillars, surmounted by a canopy, and will be placed over the well. The scheme for the preservation of the well is arousing considerable interest in the district, and altogether it is intended to raise a fund of 500*l.* to be devoted to this purpose. It is intended to interest antiquaries and theologians in the project by holding a series of public meetings in Jarrow and Newcastle.

THE Borough of Camberwell has always been among the most pushing of the public bodies of London. Last Monday the Mayor opened the Grove Vale depôt in East Dulwich. It has been erected at a cost of about 30,000*l.* from the designs of the borough engineer, Mr. William Oxtoby; the contractor was Mr. H. L. Holloway, of Deptford. The main depôt is 1½ acres in extent, whilst a large piece of land lying between the Approach Road and the London, Chatham and Dover railway embankment, has been enclosed by lofty walls, is paved with granite setts, and will be used for the storage of materials for road-making and other purposes. The various blocks of building provide accommodation for nearly 100 horses, and there are fodder and corn stores, workshops for wheelwrights, carpenters, painters, farriers, harness makers and smiths. Several rooms are devoted to machinery. For many years past in Camberwell the want of a central depôt has been greatly felt, and it is to remedy this that the present work was carried out.

A MEETING of ratepayers has been held at the temporary Board school, Litherland, for the purpose of protesting against the action of the Litherland District Council in requesting their surveyor (Mr. W. B. Garton) to resign his position. The chair was occupied by Mr. W. Roberts, who said the public could see no reason why the surveyor should be requested to resign. They were of opinion that the Council's action had been very severe, because Mr. Garton was beyond the age limit, and there was nothing left for him but to be cast on to the streets. There was absolutely nothing against him, and they all knew him to be an honest, upright and straightforward official of the Council. When he first came to the district the population numbered 2,000, whereas it was now 10,500. His starting salary was 100*l.*, and at the present time he was in receipt of 144*l.* with house, &c. An animated discussion followed, and ultimately a resolution was unanimously passed in favour of Mr. Garton retaining his position, and a

large and influential committee was appointed to formulate petitions, to obtain the requisite signatures, and present the same to the Council.

NO more sure index to the advance in taste of the present generation is to be found than the way in which we desire to have artistic surroundings. Those who cater for the public recognise this, and endeavour to answer the demand. A notable instance is the Monico. This famous restaurant has had to undergo some enlargements and improvements, and in doing so money seems to have been no consideration. The principal rooms affected are the table d'hôte room and the International Hall. The former has been decorated by Messrs. Jetley, of North Audley Street, who have been influenced by drawings and documents of the pre-Raphaelite school. Mr. Boekbinder has superintended the improvements in the International Hall. The architectural features of the apartment have not been altered, but the ceilings, walls and windows have undergone an entire change. The walls have been fitted with beautifully modelled panels, highly decorated and lavishly enriched with gold. The ceiling has been covered with fibrous plaster enrichments, and the girders have been supported by artistically modelled caryatides. The whole scheme is in the Renaissance style, with light tints, giving to the hall the appearance of greatly increased space.

A STREET subsidence at Dalton-in-Furness, which occurred last week, is much more serious than was expected. The ground in Station Road suddenly collapsed, leaving a hole about 20 feet deep and almost as many feet wide. Many cartloads of material were tipped into the hole, but it gradually sank, and now iron girders will be put underneath the street at the dangerous part, with the ends resting on solid rock. The gap will be filled up and concreted. There have been several subsidences in the same valley. The "fault" in the limestone rock in the neighbourhood is fairly extensive, and to this and the mining and pumping operations at the mines the accident is attributed. Some years ago, about a mile and a half from Dalton, part of the railway suddenly subsided, engulfing a locomotive, which has never been recovered.

THE new branch library which has been erected at Routh was opened by the Mayor recently. It is built in red pressed brick, lined inside with buff-coloured bricks, with a glazed brick dado. The arcade system has been adopted to separate the lending department and ladies and boys from the main reading-room, and this arrangement adds materially to the internal effect. The main hall is 65 feet long, 45 feet wide and

32 feet high, in addition to which are librarian's office, mess and storerooms, &c. In designing the building, which is lighted throughout by electricity, the architects (Messrs. Teather & Wilson, of St. Andrew's Buildings, Queen Street) had in view three important features, namely, supervision, it being possible for the whole of the interior to be under the eye of one attendant, thus effecting economy of staff, and providing abundant ventilation, and light on all sides of the readers. At present the library numbers 7,000 volumes, but it is capable of containing 11,000, and can be expanded so as to contain 17,000. Including boundary walls, fittings and furniture, the building has cost 2,485*l*.

The foundation-stone of the Freemasons' Hall at Oswestry was laid on the 17th inst. The designs prepared by Mr. W. H. Spaul are in the Renaissance style. The building will be faced with red brick and buff terra-cotta dressings. It will be warmed throughout by hot water and fitted with the electric light. The cost is estimated at about 2,000*l*. Messrs. Griffiths & Sons, of Ellesmere, are the contractors.

A NEW Nurses' Home in connection with the Altrincham Provident Dispensary and Hospital was opened on the 12th inst. by the Duchess of Buckingham and Chandos. The accommodation in the hospital for the nursing staff had been inadequate for a long time, and about two years ago plans were prepared for the erection of a new building. The cost of a scheme of that kind was found to be too large for the reserves, and instead of building a new home the hospital bought a convenient house near by which happened to become vacant. The premises cost 1,500*l*. The building has been altered and additional bedrooms have been added, and the whole expense of acquiring and fitting up the home has amounted to 3,400*l*.

THE alterations and improvements which for some time past have been in progress at Holy Trinity Church, Chester, are now practically completed, and the work has been carried out without the necessity of closing the church on Sundays. The principal improvements effected are the internal restoration of the roof, which has for some time been very defective; the provision of proper ventilation; the extension of the heating apparatus round the clerestory and under the east and west windows; the installation of electric light throughout the church, and the restoration of the organ. The work has been carried out under the supervision of the architects, Messrs. Douglas & Minshull, Chester.

THE Mayor of Hull reported to a special meeting of the improvement committee that negotiations had taken place with

the Post Office authorities with a view of providing a site for the new central post office at the corner of Alfred Gelder Street, a new and wide thoroughfare which is now being constructed on the south side of the town hall. After due consideration the committee unanimously resolved that the Corporation assent to the proposal made by the Government authorities for the exchange of a piece of land at the corner of Alfred Gelder Street for such portion of the frontage of Mr. Dumoulin's property as is required to widen Lowgate, and also for part of the rear portion of such property, the areas exchanged being equal in quantity.

HOUSING OF THE POOR IN IRISH TOWNS.

A LECTURE was lately delivered in Dublin by Mr. Joseph Maguire, B.L., upon the "Small Dwellings Acquisition Act." In explaining the provisions of the Act, the lecturer pointed out that the whole working of it lay in the observance of two sets of statutory conditions—those precedent to the advance and those subsequent to it. At present the financial basis should be made so as to leave a fair margin to the local authority for working it. In working out the provisions of the Act, practical care should be taken to select, as far as possible, titles which would not be complicated—freeholds could more easily be brought within the Act than leaseholds. The Act empowered the local authority of any area to advance to the resident occupier of any house within the area a proportion of the purchase money necessary to acquire ownership. The advance was not to exceed four-fifths of the market value of the ownership, nor 240*l*, except in case of fee simple or leasehold with ninety-nine years unexpired. In either of those cases 300*l* might be advanced, but no advance was to be made when the market value of the house exceeded 400*l*. In all those cases the opinion of the local authority was to be the criterion of market value. Actual residence at the time of the advance was not essential, but the borrower must intend to reside, and undertake residence therein within a period not exceeding six months, which the local authority might fix from the date of the advance. The period allowed for repayment was such as might be agreed upon, not exceeding thirty years, and the rate was not to exceed one-half per cent. more than the rate at which the local authority could then borrow from the Commissioners of Public Works. Repayment might be made either by equal instalments

of principal or by an annuity of principal and interest combined. For the actual borrower who had become a proprietor the scheme of the Act was highly satisfactory. But to many intending borrowers and to the local authority, with whom they must treat, it was, on the other hand, not so satisfactory. The duties and responsibilities thrown on the local authority were so onerous as to be practically deterrent. Having regard to the inquiries as to title, sanitary condition and repairs, which were required to be made by the local authority before an advance was made, and having regard also to the duty of keeping a register of such advances as might be made and of enforcing the statutory conditions in relation to each, it was a matter of no surprise that comparatively few local bodies had yet adopted the Act, though it had been passed in 1899. Considerable credit was therefore due to the Corporations of Dublin and Belfast who, notwithstanding heavy and daily increasing financial responsibilities, had, in the interests of their citizens, adopted the Act in spite of its shortcomings. A more liberal margin between the rates for borrowing and lending by the local authority would no doubt commend its adoption by bodies already too heavily weighted with financial burdens to undertake voluntarily a further financial responsibility. It was one thing for a public body to adopt the Act, and another to work it fully and freely.

WINSLEY SANATORIUM.

PLANS have been prepared by Messrs. Silcock & Reay, of Bath, for the sanatorium which it is proposed to erect at Winsley, near Limpley Stoke, for patients suffering from tuberculosis in the counties of Gloucestershire, Somerset and Wilts. In designing the building the plans of the principal continental sanatoria have been consulted, and the leading features in them which experience has proved to be desirable have been adopted. The general arrangement consists of a long main building, with wings at both ends, set on the south side at an obtuse angle, thus securing for the various apartments the maximum amount of sunshine with the least exposure to the easterly winds. On the north side the wings project at right angles to the main building, and in addition there is a large projection in the centre containing the principal entrance and hall. The kitchen and offices, together with the dining-hall over, are contained in a building separated entirely from the sanatorium proper, and approached by a

covered way and bridge. The building has three floors, each 10 feet high, consisting of a wide corridor extending nearly the entire length of the north side, with the rooms on the south; at the junction with the wings the corridor is continued, but in the centre, with rooms on either side.

The ground floor contains a spacious entrance-hall, with bureau, staircase, reception-room, library, large cloak-rooms, wardrobes and disinfecting-room. One wing is devoted to the use of the medical officer, and contains his dining-room, study, consultation-room and laboratory and dispensary. Suitable apartments are provided in the other wing for the matron, and immediately adjoining them are the linen and store rooms. In addition to the principal staircase, others are provided at each end of the north corridor, affording easy access to all parts of the building. A passenger lift, capable of containing a bed or reclining chair, is also provided. The two projecting buildings at the end of the north front contain the lavatories, bathrooms and w.c.'s, ample provision being made for both sexes. Especial care has been taken to entirely disconnect these from the main building; this has been done by means of a ventilated passage. The first and second floors are given up to the bedrooms, and additional rooms have been provided in the roof for the use of the female staff. The building will be capable of accommodating sixty patients. A wide verandah runs along the south side and returns round the two wings, and additional verandahs are provided on the north side, sheltered from the east winds by the projecting buildings. The building is to be erected with rough stone obtained from the site, and the walls will be impervious to moisture by a facing of a cement stucco.

INQUIRY INTO LONDON FOGS.

THE general purposes committee of the London County Council report that they have had under consideration a letter from the Secretary of the Meteorological Office, stating that it is proposed to hold an inquiry into the occurrence and distribution of fogs in the London district, and their relation to other atmospheric and local conditions, and asking for the co-operation of the Council in the conduct of the inquiry. The suggestion arose out of applications to the Meteorological Council, from electric supply companies and others, for special forecasts or warnings of the approach of fogs. The committee propose:—(1) That a gentleman of suitable scientific qualifications

be engaged by the Meteorological Council for a limited period to formulate instructions and a scheme of observations, and to conduct the investigation; (2) that the observations be taken at the various Fire Brigade stations, and by men of the Fire Brigade; and also, if it can be arranged, at other institutions of the London County Council; (3) that the returns be sent from the various stations, and from any other institutions selected, direct to the Meteorological Office; (4) that the Meteorological Council do arrange with the police authorities for observations to be taken at selected positions outside the county of London; (5) that all responsibility as to the conduct of the investigation and any published results of such investigation do rest with the Meteorological Council; (6) that a copy of the complete returns and twelve copies of a report thereon by the Meteorological Council be supplied to the London County Council, and that the London County Council do contribute a sum of 250*l.* for the investigation." The committee understand that these proposals represent a satisfactory and practicable arrangement, that the Fire Brigade committee will raise no objection, and that the chief officer of the Fire Brigade is prepared to conduct the work as far as the brigade is concerned, provided that the instruments intended to be used for the observations are the ordinary hygrometric instruments, such as are used in the Royal Navy.

WORKMEN'S COMPENSATION.

A PARLIAMENTARY return has been issued from the Home Office giving statistics of proceedings under the Workmen's Compensation Act, 1897, and the Employers' Liability Act, 1880, during the year 1900. Neither of the Acts contain any provision for the making of returns, the only source, it is explained in an introductory note, from which official statistics can be obtained are:—(1) Returns as to cases which come before the county courts, supplied by the registrars; (2) returns of cases in which memoranda recording agreements or awards by private arbitrators are registered; (3) certain particulars of cases carried to appeal; (4) official references to the medical referee; and (5) particulars as to certified schemes. These returns leave untouched the great body of cases of compensation. In the majority of cases compensation is settled by agreement or by informal arrangement, of which no official information is available. Of those cases

in which a record is available, the return shows that in England and Wales the total number dealt with by county court judges and arbitrators in 1900 was 1,145, as compared with 999 in the previous year. The cases settled by acceptance of money paid into court numbered 70. There were also 407 cases which were either withdrawn, settled out of court, or disposed of in such a way that the results are not officially known. Of the claims settled within the cognisance of the committee, 867 were in favour of the applicant and 194 in favour of the respondent. The proportion in which the applicant is successful has increased from 75 per cent. in 1899 to 81 per cent. in 1900. In 245 cases compensation on account of death was awarded to dependents, the total amount awarded being 40,042*l.*; a slight increase over the total figure for the previous year, though the average award has fallen from 173*l.* to 163*l.* The average award in cases of injury was a little more than 9*l.* As to the effect of the Workmen's Compensation Act on the number of cases brought under the Employers' Liability Act, 1880, the reduction, as compared with 1898, is only 25 per cent., while the reduction in the amount recovered is about 34 per cent. The average amount of solicitors' costs under the Employers' Liability Act was 21*l.* 4*s.*, and under the Workmen's Compensation Act 9*l.* 17*s.* 9*d.* The number of cases under the Workmen's Compensation Act carried to the Court of Appeal in England was 90, or nearly 60 per cent. of the cases that came before the county courts. This is an increase as compared with 1899 of 4 per cent. In Scotland the number of appeals has increased from 18 to 32. Of the English appeals 31 were by workmen and 59 by employers. Of the former nine and of the latter 25 were successful. There were seven appeals to the House of Lords, in six of which the workman was the appellant, and in five of the six the appeal was successful. Generally the returns for 1900 do not show any very great change in the operation of the Act compared with those for the year 1899. There is, however, a tendency to increase in the number of cases brought before the county courts, and still more in the number of cases carried to appeal. In the case of deaths, where the claims are for comparatively large sums, a good many, as in 1899, are disputed. The number of claims for compensation on account of death in 1900 was altogether 2,314, but only 14 per cent. came before the Court for decision. As to claims for injury, it is stated that the unofficial figures available in certain industries show clearly that the number of litigated cases is less than 1 per cent. of the total number of cases in which compensation is payable.

MELTHAM SEWAGE SCHEME.

LOCAL GOVERNMENT BOARD inquiry was held on the inst. by Colonel A. E. Durnford, R.E., into an application the Meltham Urban District Council for consent to deviate from the chemical purification scheme of sewage treatment, for which a loan was sanctioned in 1899.

It was stated by the Council's solicitor, Mr. F. A. Reed, that the scheme previously sanctioned consisted of chemical precipitation followed by artificial filtration and subsequent filtration, but the Council now desired to substitute in place of that the polarite bacterial oxidation system, which would be more suitable for the requirements of the district in the scheme previously sanctioned, whilst the advantages to be obtained from it, in addition to greater efficiency, were that the use of chemicals would be dispensed with, the works would be automatic, and there would therefore be a considerable saving in labour.

Mr. J. B. Abbey, of Messrs. Abbey & Son, of Huddersfield, engineers to the Council, produced the plans of the proposed works and described the system, which briefly consists in passing the sewage through a screening tank, and then into detritus tanks, where the organic solids will become split and disintegrated by the liquefying action of the bacteria present. From the detritus tank the sewage enters three aerobic bacteria beds, the effluent from which will flow along settling channels, and then be sprinkled by means of automatic revolving sprinklers fed by automatic intermitters on to polarite bacterial oxidation beds. These beds have a combined area of 104 square yards, with a working depth of 3 feet 6 inches, and will deal with 240,000 gallons of sewage per day. The advantage of delivering comparatively small quantities on the beds with short intervals of rest is that a more complete oxidation of the effluent, as well as filter bed, is obtained, and consequently a higher degree of purification of the effluent, is obtained by thoroughly deluging the beds and giving longer intervals of rest. Experience has also proved that better results are obtained by sprinkling than by either continuous distribution or ordinary contact beds.

Dr. Wilson, chief inspector of the West Riding Rivers Board, was in attendance, and expressed the opinion that this was one of the most complete schemes he had seen submitted to any district council, and urged that the work should be put on foot forthwith, the intercepting sewers having already been completed.

ASTLEY-CHEETHAM FREE LIBRARY, STALYBRIDGE.

THE new public free library which has been presented to the borough of Stalybridge by Mr. J. F. Astley-Cheetham, was formally opened on the 16th inst. by Mrs. Astley-Cheetham, the wife of the donor. The library is adjacent to the new post-office, which has been designed in His Majesty's Office of Works, and the two buildings are in sufficiently similar styles. The architectural style chosen by Mr. Astley-Cheetham is that commonly known as Jacobean, with great mullioned windows and bold cornices. It was at first intended that the whole of the exterior should be in stone, as most in keeping with the characteristics of the more ancient buildings of the district. Subsequently it was decided to face the upper part of both library and post-office with bricks of a deep red colour. The roofs are covered with purplish red tiles, which harmonise well with the brick and stone below. The windows of the staircases and some others are glazed with lead lights, the other windows generally with clear plate-glass. The casements are of bronze metal, which is not liable to rust or decay. The outer doors and the main entrance doors are of oak, but the interior woodwork generally is pitch-pine. The central hall, which is lighted from above, is surrounded by pillars and arches of red terra-cotta. The planning and arrangement of the rooms is such as to enable the librarian and his assistants, without moving from their places, to keep an eye on what is going on in the different rooms. The whole of the westerly part of the building has well-lighted and ventilated cellars, fit for use as book stores or bookbinding workshops, or otherwise. There is also a sitting-room for the staff, other than the chief librarian. The ground floor is nine steps above Trinity Street, where is the main west entrance. In the outer porch is a stone tablet, carved with the following words:—"The foundation-stone of this building, the gift of her husband to the town of Stalybridge, was laid by Beatrice E. Astley-Cheetham, on October 9, 1897, in commemoration of the sixtieth year of the glorious reign of our Sovereign Lady the Queen Victoria." The vestibule leads to the central hall. At the south-west of the hall is a spacious apartment intended for use as a reference library. At the north-west corner is a smaller room, which may be used for magazines or otherwise, as found convenient. At the north end of the central hall is the boys' room. At the north-east corner of the building is the news-room, and at the south-east the book-store, which has direct communication

with the space behind the counter where the assistant librarians stand. At the south of the central hall are the librarian's private room and other necessary offices. The great staircase for the public is to the north of the main entrance. This leads only to the lecture-hall on the upper floor. The hall extends along the whole of the west front, excepting only the portion occupied by the staircase, and will seat comfortably about 250 persons. It has a panelled open roof and large windows east, west and south. The building is electrically lighted throughout. The architect was Mr. Medland Taylor, of Manchester, and the builder Mr. Isaac Gould, of Leeds.

RAINY HALL, EDINBURGH.

THE decorations of Rainy Hall, New College, Edinburgh, which was formally opened about twelve months since, have now been completed in accordance with the original designs of the architects. The architecture of the hall is in fifteenth century Gothic. The roof, an open timbered one, with the hammer-beams resting upon stone corbels, which are richly carved, is divided into six sections by massive main rafters. The hammer-beams are connected by arched ribs, the spandrels of which are carved and gilded. The flat soffits over the spandrels and the upright parts of the ceiling over the hammer-beams are divided into panels, which are filled with painted ornament in primary and secondary colours in keeping with the architectural style of the hall. The cornice dividing the soffits from the upper panels has also been relieved in primary colours, with the carved ornament in solid gilding. The upper section of the roof is divided into panels with moulded ribs, and the panels have chevron bands of blue and red colour, which are relieved by ornaments of fleur-de-lys and roses in pale yellow. The walls of the hall are fitted with wainscot to the height of 10 feet, and are divided by decorative buttresses into bays to correspond with the bays of the roof. The cornice at the top of the wainscot dado is richly carved, the ornament representing the vine; the foliage is in solid gilding and the fruit in red and blue. The upper walls are oil-painted in rich blue, with stencilled ornament, the lion rampant alternating with fleur-de-lys in shades of red. On the walls are hung portraits of moderators and professors, which enhance the appearance of the hall, the place of honour being given to a kit-kat portrait of Principal Rainy above the platform. The electroliers, of graceful design, are

in wrought-iron, and these have been finished in the st oxidised silver. There are shields on the stone corbels, support the hammer-beams, in the centre of the c spandrels between the principals of the roof, and on the of the hammer-beams. These shields, 48 in number, been filled in with the coats-of-arms of the nobles joined the Covenanting party in Scotland in 1638. In sel the arms to be emblazoned on the shields, the tests applied w Signature of the Covenant of March 1638, or presence a great Assembly in Glasgow in December 1638, or particip in the muster of the Covenanting army at Duns in Jun Among the nobles who fulfilled one or other or all o tests, and whose names appear, are Argyll, Loudon, Suther Montrose, Rothes, Cassillis, Lothian, Balmerino, We Blantyre, Eglintoun, Dalhousie, Cupar, Sinclair, Marre, F Forbes, Boyd, Lindsay, Dunfermline, Carnegie, Maris Home, &c Professor Masson, whose knowledge of the h of the period is unsurpassed, was kind enough to giv assistance in selecting the names, and he considers th clusion of Montrose and Rothes as an act of great hist courage. There are also shields with the Royal ar England, Scotland and Ireland, and with the arms o university towns and universities in Scotland. The her has been specially drawn for the shields by the arch under the direction of Mr. James Baltour Paul, the Lyon of-Arms, who took great pains to ascertain the correct an the various nobles as borne in 1638. The whole of the has been admirably carried out by Mr. James Clark, G Street, under the instructions of the architects, Messrs. S Mitchell & Wilson.

A NEW PETROLEUM LIGHT.

THE electric light, which a few years ago seemed destin take front rank in artificial lighting, has not only met a s rival in the improved light brought about by incandescen which, with the introduction of high pressure, certainly passes it when the question of cost comes into consider but it is now threatened with a more serious opponent shape of our old friend petroleum. To the mind o majority the mention of petroleum naturally suggests a yellow light, attended with many objectionable featur smoke and evil smells, not to mention troubles with chit and dangers of explosion. All these drawbacks, howeve

ly eliminated when the oil is burnt on the Bunsen principle with an incandescent mantle. The adoption of this principle has hitherto been prevented by the trouble caused by decomposing and clogging the burner, making the light faint and necessitating skilled attention. Our notice has been drawn to a new system of oil lighting, in which the inventor, Mr. A. Blanchard, claims to have entirely overcome the obstacle, and thereby providing a light unrivalled in brilliancy, possessing all the brilliancy of the electric arc light and its inherent unsteadiness and liability to extinction. In this system the oil is supplied under pressure from a cistern through tiny metal pipes to the burners, while it is vapourised and burnt like ordinary gas. The light is regulated by a tap in any convenient spot, which may be at any distance from the burner, and a by-pass is used to obviate the necessity of lighting. A burner yielding a light of 500 candle-power will run in twenty-four hours one gallon of oil, and the lamp will run continuously for about three months without attention, any kind save filling the reservoir, which is required only about fourteen days, depending, of course, on the capacity of the vessel. The Blanchard lamp should be of great interest to those who have large areas to light, for its purpose it is admirably adapted, street illumination in particular.

NEW CHURCH, PATNA.

The new United Free church at Patna, N.B., of which the foundation-stone has recently been laid, is to be built on an elevated site facing the main road through the village, and is designed in Gothic style of the Early Decorated period. The road is a lofty gable, with entrance porch at one end behind which an octagonal staircase turret rises to a height of about 70 feet. A projecting buttress runs up the side of the gable, and on each side of this buttress are windows in the lower part of the gable, and double windows with richly traceried heads in the upper part. The gable terminates with a canopied niche under the apex of the gable. The entrance porch has a deeply-moulded archway leading into the stone-lined porch, within which double stairs lead to the area and the gallery staircase. The stairs are carried up quite plainly in the lower stages, but the upper part is pierced with four tall belfry openings, divided by lions and with tracery in the heads. Above this the roof will be carried up and finished with red roofing

tiles. The side elevations are agreeably varied with tall double and triplet windows, divided by massive buttresses and broken by projecting transepts. Internally the church is cruciform in plan, with shallow transepts, one of which forms an organ-chamber. The nave is roofed in one span with semi-octagonal roof, divided into six bays by massive moulded timber couples, and will be lined with wood. Moulded stone arches span the transept openings, and the pulpit will be placed under a stone arch with moulded shafts. The pulpit gable is pierced with a six-light wheel window, and the lower part of the gable behind the pulpit will be finished with wood panelling. The church will accommodate when completed 422 sitters, of whom 86 will be in the end gallery, and the sittings will be arranged on the most roomy and liberal basis with ample organ and choir accommodation. A capacious vestry is provided behind the church, and the likelihood of future extension is prepared for. The materials used are red Ballochmyle stone for all walling and hewnwork, the roofs will be slated with light green slates and red ridge tiles, the whole interior woodwork of pitch-pine and windows glazed in cathedral glass. The masonwork is already well advanced. The buildings have been designed by Mr. John B. Wilson, A.R.I.B.A., Glasgow.

WOLVERHAMPTON FREE LIBRARY.

The new free library, which has been erected on the site of the old Theatre Royal at the corner of Garrick Street and Cleveland Road, Wolverhampton, is so far completed that it is expected that it will be opened in about three months' time. The structure is two storeys high, and the main rooms will be a news-room and reference library, 50 feet by 45 feet, and a magazine-room and lending library, 50 feet by 68 feet. The material used in the exterior walls is mainly red pressed bricks with terra-cotta dressings. Over the main entrance which faces Snow Hill are the royal arms in terra-cotta, and over the windows of the Garrick Street elevation are the names of well-known poets in terra-cotta lettering. The rooms on the ground floor are lofty and well lighted by means of crown topped windows, and the floor above is supported by a number of Corinthian pillars with plain shafts, panelled bases and ornamental capitals. The rooms on the first floor are reached by a wide staircase winding from the left side of the main entrance. At the top is a spacious landing with a handsome domed and lighted roof, ornamented with the borough arms and borders

Y-OATWAY FIRE ALARM

Inexpensive, and Reliable.
by H.M. Postmaster-General.

Church has just been seriously burned, and ruin of St. Paul's or Westminster Abbey next. by fire is now unpardonable. The May-arm insures discovery in time to prevent loss of lives. It detects the fire, calls the nearest fire engine, and points out the seat, extent, and direction of the fire automatically, whether the building is a house, or a factory. Architects and builders invited to inspect. W. Y-Oatway (late London Fire Brigade), Chairman, and Consulting Electrical Engineer. of flowers. On this floor is the reference library, with a domed ceiling, supported by four massive columns. It will be panelled with oak. Leading out of this room are the librarian's room and other apartments for the members of the staff. On the other side of the landing access is gained to the lending library, which is already fitted with an entirely new system of shelving for the books. This room has an arched roof, and is also well lighted. The whole of the rooms will be coloured to produce as light an effect as possible.

ST. HELENS GASWORKS.

OWING to the constantly increasing business with which (in spite of the large and growing demand for electric light) the St. Helens (Lancs) Corporation Gasworks have to contend, it is found imperative to extend the works, and for this purpose nearly eleven acres of land, formerly the site of M'Bryde's chemical works, and belonging to the United Alkali Company, have been acquired. When the present works in Warrington Road were purchased from the old Board of Commissioners in 1875 at a cost of 131,600*l.*, the capacity of production was a million cubic feet per year, an output which has increased since that time by 400 times. The plant is now capable of manufacturing a million and a quarter of cubic feet of gas a day. The capital expenditure up to 1891 was 201,486*l.*, and up to this year 274,499*l.* In 1891 the year's income was 36,138*l.*, and for the last twelve months it was 53,818*l.*, the price being 2*s.* 6*d.* per 1,000 feet, against 2*s.* 9*d.* in 1891. The amount transferred to the borough fund for the relief of the rates since the gasworks were purchased by the Corporation was 49,030*l.* In order to extend the works the gas committee have for some time been looking for a suitable site, and that now decided upon is in the midst of many large factories and works, and is in close contact with two railways. The minutes of the proceedings of the gas committee referring to the proposed purchase of M'Bryde's works include a resolution to that effect, and another which authorises the town clerk to apply to the Local Government Board for a provisional order so as to give the Corporation power to hold and to erect gasworks, and to manufacture and store gas and residual products upon the lands to be acquired by them, and to confer upon the Corporation all necessary increased borrowing and other powers with respect to the extension of their gas undertaking, and that the sub-committee be authorised to arrange the neces-

sary details and give the requisite instructions to the town clerk and the gas engineer in the matter.

MIDLAND COUNTIES ASYLUM.

AT a special general meeting of the donors and subscribers of the Midland Counties Asylum (Knowle), over which Lord Leigh presided, Sir Arthur Hodgson, referring to the proposed extension of the asylum, drew attention to the appeal support issued to the public, pointing out that the institution was established in 1868 through the combined efforts of their president, the late Dr. Bell Fletcher, and Messrs J. H. Kimbell and G. F. Muntz. During the three years 39 per cent. of the cases received into the asylum had been discharged showing various degrees of improvement. It was built originally to accommodate 60 patients, but by an enlargement in 1893 this number was increased to seventy-five. The building was now filled to its utmost capacity, while the applications for admission continued to increase. The Lunacy Commissioners having frequently pointed out the necessity for increased lavatory improvements and additions the committee had been compelled to carry out those suggestions. The cost involved was estimated at 2,000*l.*, and the improvements would absorb a legacy bequeathed by the late Mr. W. H. Wood, of Birmingham, together with the present bank balances. The effect of this would be to deprive the committee of all the available cash on the side their investments. Sir Arthur concluded by reading the remainder of the special appeal, which stated that it was intended to combine facilities for the classification of patients, providing suitable rooms for those patients whose condition rendered them unfit to associate with those capable of mental and physical improvement. The probable cost of this work was about 5,000*l.* The annual average cost of maintaining an inmate in the asylum in 1900 was 32*l.*, the subscriptions and donations for that year were 4,017*l.* 17*s.*, and the payments for friends of patients 1,375*l.* The average number resident during the year was sixty-five, and out of that number forty-six were election cases at 10*l.* per annum. In view of its past and present usefulness and the urgent necessity for maintaining and extending the scope of the only institution of its kind in the Midland Counties, the managing committee confidently appealed to the friends and supporters of the charity and the residents within the counties of Warwick, Stafford, Sal-

chester and Worcester to assist in carrying out the additions and improvements. The appeal, added Sir Arthur, was absolutely necessary—5,000% being required—a good deal of the work having been forced upon the committee by the Commissioners. Sir A. F. Godson moved a resolution approving of action of the managing committee in deciding to enlarge present asylum buildings for the purpose of sanitation, ventilation and improved industrial training, rendered necessary by the increased applications for admission. The resolution was unanimously adopted.

APPRENTICESHIP AND TECHNICAL EDUCATION.

The following circular is now being addressed to the local authorities acting in conjunction with the Plumbers' Company, and to the associations engaged in the building industry in the various centres of the kingdom:—

The committee of representatives of district councils in London, Birmingham, Bradford, Cardiff, Dublin, Edinburgh, Glasgow, Leeds, Liverpool, Manchester, Nottingham, Plymouth, Sheffield, acting in conjunction with the Plumbers' Company, deem it highly desirable that a prescribed apprenticeship course of training should be recognised in connection with the national registration of plumbers. A special form of indenture has been prepared for the purpose by a conjoint committee composed of representatives of the London Society of Associated Master Plumbers, the United Operative Plumbers' Association of Great Britain and Ireland, and the Plumbers' Company. The indenture is based on the form of indenture authorised by the Corporation of the City of London and approved by the Court of Chancery. It includes definitions of character and scope of the work of the registered plumber of the term "sanitary plumbing," as approved by the Parliamentary Committee on Trade, in order that the sanitary nature of the work of the registered plumber may be generally recognised by plumbers, as well as by architects, local authorities and others, as constituting the reason for the registration system and the ground of the application of statutory powers to be conferred on the registered body. The definitions are in the following terms:—The trade of a plumber and the art of sanitary plumbing, including all branches of the said trade or of the said art which require technical knowledge of water fittings and other sanitary appliances, and skill to construct and adjust the same in such

manner as to prevent the contamination of air or water in dwelling-houses or other buildings by emanations from drains or sewers. Covenants are included expressly providing for (1) the attendance of the apprentice at approved classes of technical instruction; (2) the apprentice presenting himself for annual examinations in technical knowledge and workmanship in conformity with such regulations as may from time to time be prescribed in connection with the national registration of plumbers; (3) the cancelling of the indenture after due notice to the parties in the event of the apprentice failing to pass a satisfactory examination in the third year of his apprenticeship, provided such cancellation be recommended by the examining body. It is recommended that this form of indenture (subject to such modification as may be necessary to meet special cases) should be generally adopted with a view to a uniform qualification being established for the purpose of the national registration of plumbers. It is also recommended that a register of apprentices should be kept in each district. It is hoped that the desire to provide an efficient system of training for the coming generation of plumbers will have the sympathy and support of each council, and that they will be pleased to encourage the object by securing the adoption of the prescribed form of apprenticeship as far as possible in the district. A corresponding form of indenture is prepared adapted to the requirements of the Scots law.

THE CARRARA MARBLE INDUSTRY.

THE United States Consul at Leghorn devotes a recent report to the present condition of the marble industry at Carrara, in which practically all the adult males of the communes of Carrara and Massa (with a total population of 45,000) are engaged. At present 611 quarries are being worked. The concessions are in the hands of the local authorities, and are really granted in perpetuity, subject to the payment of the annual rent, though nominally only for thirty years. The rent also is nominal. The Marina, the port of export, is on the sea only six miles from Carrara. Since 1890 the marble slabs have been conveyed here from the quarries by a railway which is a marvel of engineering skill. Though only fifteen miles in length it cost 800,000*l.*, on account of the number of tunnels and lofty viaducts. The mode of quarrying is still primitive, and has not materially changed for centuries; but the cheapness of labour, the heavy cost of fuel and the great difficulty of access

to many of the higher quarries have much to do with the neglect to adopt modern machinery in the work. To these should be added the strong opposition of the quarrymen to innovations. The old modes of blasting take much time and cause enormous waste, the sawing is done by hand, and even months are spent over the work. Even the loading is done by rollers, skids and crowbars, derricks not being employed for this purpose. In the decade ending with 1899 the total export of the marble amounted to over 1,600,000 tons, valued at about 5½ millions sterling. Of this quantity about 20 per cent. went to the United States, the same amount to Italian ports, 15 per cent. to Great Britain and her colonies, and 13 per cent. to France. The ordinary marble is sold at about 6s. 6d. per cubic foot, f.o.b. Leghorn, and the better grades of statuary blocks at 14s. to 28s. Many varieties of coloured marbles are found in the mountains around Carrara, and some new and very beautiful ones have lately been discovered—red, black and gold, blue and dove-coloured are now quarried. Some fine onyx has also been found at Monte d'Arin. The Carrara merchants also deal largely in the well-known Siena yellow marble and the varieties of Numidian marble quarried at Oran, in Algiers. "The extent of its commerce with all nations, in its own particular line, with the variety, quality and beauty of its marbles, justly entitles Carrara to stand at the head of the marble-producing centres of the world. It has occupied this position for centuries and bids fair to continue to do so for many more to come."

RETTFORD INFIRMARY.

A NEW infirmary in connection with the Retford (Notts) workhouse has been recently opened. The old infirmary was condemned several years ago by the Local Government Board inspector, and rather than patch up this building, it was determined to erect an entirely new structure. The architect was Mr. W. Southall and the contractor Mr. C. Jones. The building, which was started sixteen months ago, has been erected at a cost of 4,000l. It is built on the north side of the workhouse premises, and extends for nearly 200 feet. The whole of the buildings are of ordinary red wire cut bricks, and the roofs are slated with Bangor slates. There are three entrances, the main, and one for the males and another for the females. The old infirmary will be pulled down and the spaces laid out as gardens. A covered way will lead from the centre of the new building to the kitchens. On the ground

floor in the centre block are the nurses' rooms on either side beyond the dispensary and kitchen with pantry. There are two acute wards and dormitories that contain fifty-six beds (men and women). The upper floor contains exactly the same accommodation for both men and women as the ground floor, but a feature for both dormitories and day-rooms is a balcony formed of rolled steel joists on cast-metal columns. Down from the said rooms open on to the balconies, and as they are on the south sides the inmates who are too infirm to get about can be wheeled out. Nurses' day and bedrooms are arranged on this floor in the centre, with lying-in ward in front. The whole of the rooms are heated by means of water and circulating pipes. All the rooms have windows each side opposite each other for through ventilation, and fresh air is admitted by means of Boyle's air inlet panels. The whole of the gas and water pipes are exposed to view, and made easily accessible in case of repairs; 160l. has been allowed for the furnishing, but this item is not so great as one would expect, for some of the furniture from the old building was utilised.

ARTISANS' DWELLINGS IN GLASGOW.

THE housing committee of the Liverpool Corporation appointed to draw up a scheme of artisans' dwellings, after visiting Glasgow, have just issued an interim report, in which they state that the artisans' dwellings of Glasgow are occupied by a much superior class to that to be provided for in Liverpool, Glasgow having so far not attempted to provide for the very poor. Criticising the details of the Glasgow dwellings, the deputation note that one water-closet is provided for four tenements, and all refuse and ashes have to be carried down to ashpits on the ground floor, and in the case of the Hagley tenements one ashpit serves sixteen persons, and no separate yard space and separate sculleries are provided. All this is in contrast to what has been insisted upon by the Local Government Board in Liverpool, and to copy Glasgow would be a retrograde step. The deputation do not approve of the Glasgow system of filling up separate floors with dry ashes to render them sound-proof, preferring concrete floors and iron joists; those of Glasgow it being contended, tending to harbour vermin. On the whole, the tenements of Glasgow are good substantial buildings, but the wooden floors did not compare themselves to the Liverpool deputation.

ARMoured FIREPROOF DOORS

To the requirements of the Fire Offices Committee.

Can be fitted with Patent Attachment for Self-closing in case of Fire.

LIGHTER & CHEAPER THAN IRON DOORS

Will not Buckle or Twist out of Shape.

WRITE FOR ILLUSTRATED CATALOGUE TO

DOWSON, TAYLOR & CO. (MATHER & PLATT, Ltd., Proprietors),

14 Victoria Street, London; Blackfriars Bridge, Manchester.

The Architect.

THE WEEK.

THE Liverpool Cathedral committee merit to be rewarded by many excellent designs on account of their desire to meet the wishes of architects. A meeting was held on Monday, when an entire change in the programme of the competition was arranged. It was proposed by the Earl of DERBY, and seconded by Mr. ROBERT GLADSTONE, that the preliminary competition for the design of the new cathedral be left open to competitors as regards style, that the time for sending in portfolios be extended till June 30 next year, and that the architects who are selected to compete in the final competition be paid the sum of 300 guineas each for their designs, whether they be accepted or rejected. An amended advertisement is to be issued immediately. A battle of styles will therefore take place unlike any which has been fought since the Courts of Justice were the prize. As many architects have had experience in designing both Renaissance and Gothic buildings, it may be expected that they will not confine themselves to one style.

THE report of the Manchester Society of Architects states there are 182 members on the roll. The Council cannot take credit for much important work during the year. All the schemes for new rooms for the Society or for joint tenancy with other societies have fallen through. The Association of Master Plasterers and Painters of Manchester and Salford (plasterers' section) requested that a sub-committee should be appointed to discuss some points in connection with plasterers' work, but although the sub-committee is said to exist, no meeting has as yet been held. Another sub-committee was formed to confer with the Principal of Owens College about the proposed chair of architecture, but there is no record of a conference. The Council held a special meeting when it was announced that a city architect was to be appointed, and passed the following resolution:—"That this Council hears with pleasure of the intention of the Manchester Corporation to appoint a competent architect as architectural adviser to the Corporation, and would respectfully suggest that this appointment should not prevent the Corporation giving to practising architects all works of architectural importance which they may in the future contemplate, this suggestion being made by them both in justice to the architectural profession (practising in this city) and as a means of securing more varied architectural treatment than would be possible if all designs emanated from one source, and this Council will have much pleasure in furthering the views of the Corporation in any way that it may consider desirable."

It is satisfactory to learn that the building trades have shown more desire to utilise the Conciliation Act than the majority of other trades. Under that Act the Board of Trade, in addition to their functions in connection with the registration of voluntary conciliation boards, are authorised to take certain action in cases in which a dispute exists or apprehended either between employer and workmen or between different bodies of workmen. The Board may of its own initiative inquire into the circumstances, or take steps to promote a conference between the parties, while on the application of either party they may appoint a conciliator, and on application from both sides an arbitrator. A special form of application is prescribed by the Act, and the Board have not suggested one, as, owing to the very different circumstances of the cases, they have considered that it is undesirable for a stereotyped form to be invariably employed. It is the usual practice for the Board of Trade to pay the fees and travelling expenses of arbitrators and conciliators appointed by them, and it is customary for the parties to the dispute to share the local expenses, such as those connected with the hire of a room for meetings and conferences, and the payment of a shorthand writer in cases in which they consider shorthand notes necessary. During the whole period since the passing of the Act in 1896 forty of the arising cases, or more than a

third of the total, have been in the building trades. The number of disputes actually settled in the two years from July 1, 1899, to June 30, 1901, was twenty-nine, of which sixteen affected the building trades. Out of the seventy settled disputes since the passing of the Act, twenty-eight were in the building trades. This is an excellent record. Masters and men who reflect must know from experience that the disorganisation which follows strikes in the building trades is less easily remedied than in most trades in this country.

THE sixty-third section of the London Building Act says:—"Every new building exceeding 60 feet in height shall be provided on the storeys, the upper surface of the floors whereof is above 60 feet from the street level, with such means of escape in the case of fire for the persons dwelling or employed therein as can be reasonably required under the circumstances of the case." The Act does not define what are reasonable means of escape, and they are not to be understood from the by-laws. On Monday the owner of a large block of high buildings let as flats at Buckingham Gate was summoned for penalties for allowing occupation of the storeys over 60 feet from the ground level without a County Council certificate that there were adequate means of escape in case of fire. It was stated for the London County Council that the plans hitherto submitted were inadequate and unsatisfactory. At present staircases were the only means of escape. Last July the defendant was fined in respect of these flats. Fresh plans had been submitted since, but they were incomplete and unacceptable. Counsel for the defendant said that a builder was placed in a position of great difficulty because no definition of what was actually required could be obtained from the County Council officials. The defendant was most willing and anxious to do all the Council demanded, and for plans to be approved he asked for an adjournment. The magistrate thought that this was reasonable, and granted a month's interval. But it may be again declared that the plans are unacceptable. The County Council can readily reject plans on that ground, but the arrangements which should be substituted are nowhere defined.

ANOTHER case under the Building Act demands attention from all who take an interest in the erection of large blocks of model dwellings. The Portland Industrial Dwellings Company own a building at the corner of Paradise Street and Ashland Place, which covers an area of over twenty-five squares. Section 74 (3) of the Act says that "in every building exceeding twenty-five squares in area, containing separate sets of chambers or offices or rooms, tenanted or constructed or adapted to be tenanted by different persons, the floors and principal staircases shall be of fire-resisting materials." As the floors and staircases were not in accordance with the Act, the builder was summoned by Mr. ASHBRIDGE, the district surveyor. Counsel for the company contended that the subsection quoted mainly referred to large buildings like flats, containing three or four rooms, intended to be occupied by different persons, and with an outer door. Every one of the rooms in the building in question might be let off separately; at any rate, a weekly rent would be charged per room. They therefore thought it was oppressive and unreasonable to try and compel them to incur the great expense of making the floors of even the smallest rooms fireproof. Mr. PLOWDEN said the question seemed to be, What was a fair meaning to be placed on the words of the Act, that in every building "containing separate sets of chambers, offices or rooms" there should be fireproof floors? In his opinion "separate sets" had nothing whatever to do with offices or rooms, but referred simply to chambers. Every kind of room, office or set of chambers which was inhabited at all should therefore have fireproof floors. Consequently he held that this building contained sets of chambers or rooms, or, even if not sets, they contained rooms which required fireproof floors. It was therefore ordered that the builder should comply with both section 74, subsection 3, and section 68 of the Act, which says the supports must also be of a fire-resisting material. Costs amounting to five guineas were imposed.

THE DESIGNS FOR THE MEMORIAL OF QUEEN VICTORIA.

IN the whole of the English annals no parallel can be found to the enthusiasm respecting a Memorial of Queen VICTORIA. The contributions up to the present time may be less than was anticipated, but the amount subscribed exceeds all precedent. It was, therefore, a rare distinction for the five architects who were selected to express the national desire for a Memorial which would be worthy of the subject. Great labour and anxiety were required, but the privilege of competing more than compensated for all the toils. To take part in the contest is to obtain a name in the history of art, whatever might be the success of the designs.

It was impossible, however, in this case, great as it was, to escape the usual consequences of limited competitions. In such cases it is always easy to anticipate the character of the work which will be produced by the different combatants. An architect who gains prominence almost inevitably falls into a mannerism which cannot escape the scrutiny of his brethren. The aim of a competitor, therefore, is to deal with definite obstacles, and his attention is so much engrossed with the endeavour to have fewer weaknesses than his rivals, he is not in a position to do justice to himself. On that account we advocated a more general competition than has been adopted. It is among the unknown quantities, so to speak, that originality is likely to arise. Men who have gained repute are more or less afraid of undertaking any course which will involve their professional character in any risk, and they are consequently timid. Architects, on the contrary, who have little to lose are likely to be more daring, and, if happy thoughts arrive, to allow them to have sway over their ideas.

The whole of the designs, which are open to public view to-day, can claim to be "safe," and do not err on the side of extravagance. They are, in fact, so well balanced, it must have been extremely difficult to decide between them. Under the same conditions it would be possible to obtain from English architects, if the competition were more general, at least 500 designs which would be equally meritorious. Each of the five designers shows that he was working under restrictions, and was afraid to let himself go, if we may be allowed to use a common expression.

The project resembled an epic theme in poetry, and in treating it everyone would like to see some evidence of the fine enthusiasm of art. A modern HOMER might occasionally be allowed to nod like his great predecessor, if he made compensation for the occasional weakness. So it should be with the designers of the Memorial. All the accessories introduced ought to be of such a character as to make a climax of the figure of Queen VICTORIA, or should be, as SHAKESPEARE says, "as happy prologues to the swelling act of the imperial theme." But all that is supposed to be practicable, according to the present designs, would be the setting up of more or less statues with a near or remote relation to the principal figure. The joyless production of the designs is apparent when we find that groups have been copied from the Albert Memorial in Hyde Park. In fact, what we have is generally the prose of architecture instead of its poetry.

It must be admitted, however, in defence of the architects, that they were working to some extent in the dark. The measure of the liberality of Great Britain in subscribing to the Memorial is uncertain, and has to be differently estimated according to the disposition of the calculator. The character of the various designs depends to a large extent upon the ideas of the authors about the money that would be available. Mr. ERNEST GEORGE, for example, takes a sober view of the amount which would be at his disposal. He has consequently been sparing of statuary along the line of roadway from Buckingham Palace to Charing Cross, and throughout respects economy. Mr. T. G. JACKSON, on the contrary, may be said to have a continuous row of statues placed in semicircular recesses along both sides of that route, and around the statue of the QUEEN they are also numerous. Mr. ASTON WEBB proposes to erect equestrian groups as well as single figures along the processional road. Dr. ROWAND ANDERSON has also many statues. Sir THOMAS DREW is so confiding in

the generosity of the public that he is not satisfied with setting up triumphal arches and employing a multitude of statues, but he has had the courage to propose the transformation of Buckingham Palace into a building that would be more majestic than any part of the Louvre. There is no doubt the existing building is not adapted to serve as a background to any ornamental scheme. This was felt by the designers, and the manner of treating the palace on the drawings reveals its shortcomings. Dr. ROWAND ANDERSON, for instance, has shown parts of his design by means of very clever water-colour drawings, but they lose much of their value and the architect's contemplated work introduced in them is affected injuriously by the mass of disagreeable colour which had to be used for the façade of Buckingham Palace. He immolates himself through his respect for facts. The small model of the statue which stands at the end of the room in which the designs are exhibited in St. James's Palace would be deprived of much of its effect if the background had been represented as it is, but care has been taken to make a piece of cream-coloured pasteboard serve instead of the sooty Portland cement. Mr. ASTON WEBB indeed proposes several alterations in the buildings. If economy were to prevail or a financial society could have control of the project, Mr. ERNEST GEORGE's design would be the favourite, but with adequate funds Sir THOMAS DREW's design if carried out would impart the gorgeousness to the surroundings of the figure of the late QUEEN which would be in keeping with the aspirations of the wealthiest of nations.

Three of the designers have laid out the colonnade in which Mr. BROCK's group is to be placed on curved lines. Mr. ERNEST GEORGE has straight lines along the sides and a rather flat curve uniting them. Mr. JACKSON prefers straight lines for his colonnade, but they are not laid out in a continuous line but in short stretches, which are connected by others at right angles. Outside the colonnade there is an almost circular roadway. Mr. ASTON WEBB seeks after lightness in his colonnade and screens, in which he introduces domed blocks with much tact. The garden about the central group contains several statues, obelisks, &c. Dr. ANDERSON keeps the architectural framing which surrounds the statue rather low in height, and on the elevation it looks to be an insufficient and unimposing barrier. But the statues introduced of the various patron saints of the country, Queen ELIZABETH and other worthies, suggest that more attention was given by him to his sculpture than by the rest of the competitors. Mr. ERNEST GEORGE varies the roof of his colonnade by utilising small domes. The Tuscan order is applied to the columns. A fountain rises in front of the statue, and a second between it and Buckingham Palace. Mr. JACKSON places his fountains at the sides of the statue. Both Corinthian and Tuscan columns are used in his colonnade, and at the angles referred to above there are arched openings surmounted by typical figures with obelisks above. The number of vases brought in to break the monopoly of the upper horizontal lines is too commonplace a device for so important an undertaking. Far too many of the ordinary means for overcoming difficulties are to be recognised in the various designs, and the conclusion must be drawn that there is not much difference between the Italian which was in vogue at the beginning of the late QUEEN's reign, and the Renaissance which finds favour with successful architects at the present time.

The official instructions made it necessary to have a straight line of roadway from the Palace to Spring Gardens. Mr. ASTON WEBB has introduced a *rond point* which breaks the sameness and is an agreeable arrangement. Mr. ERNEST GEORGE's gateway at Spring Gardens is simply treated, but is one of the most interesting features in his design. It would appear rather plain if contrasted with the high and ornamental structure which Sir THOMAS DREW employs to mark the opening of the avenue.

The drawings are excellent; nearly all are made by the pen. The coloured drawings cannot be considered as advantageous from a competitor's point of view, because Buckingham Palace becomes a blot which does not enhance the merit of the proposed work. All the representations are straightforward, and if the works were carried out they would be not less effective than the appear in the designs. But for the realisation of the adopted design, or, indeed, of any of them, the amount of

money contributed is insufficient. If the designs are exhibited in provincial towns as well as in St. James's Palace they might have the effect of inducing people to subscribe to a larger extent. As we have said at first, there is a remarkable equality about the merits of the collection, and on that account they all somehow co-operate in emphasising the character of what is proposed to be accomplished. We cannot recall a competition in which the effect was of the same kind. But where there is so much of a level in merit and so marked a confirmation of the original proposal there is opportunity for discussion, and in that way the desires of the promoters of the Memorial will be likely to be realised, and the work can be undertaken on a satisfactory basis.

MEDIÆVAL BEVERLEY.

ACCORDING to CARLYLE, "The soul gives unity to whatsoever it looks upon with love; thus does the little dwelling-place of men, in itself a congeries of houses and huts, become for us an individual, almost a person." In that way Beverley in Mediæval times can seem to us a being who believed in religious and trade guilds, and insisted on other people observing the rules and regulations of them, especially those relating to pageants; who was disposed to levy fines on slight breaches of by-laws, who was willing to become an archer or an armed man whenever occasion demanded, who had no objection to the common funds being applied occasionally to exhibitions of dancing bears in the market-place, who considered it was an offence to kill a bull unbaited, who was ready to accept articles like a modern pawnbroker in payment of taxes and dues when money was not to be obtained, who objected to trading with foreigners, but sought for judgment against a native who sold shoes which were "not sufficiently made" or formed of sheepskin, or adulterated his bread. Although many of the most important records have disappeared, enough remain to enable imagination to create for itself a representation of life in the ancient town, and of the stout Yorkshiremen who found their abode in it.

Architects and other lovers of buildings will, however, regret that amidst so much information about everyday life there is a lack of reference to the noble church which is the chief reason for the reputation of Beverley. The Minster was one of the buildings which RICKMAN in the beginning of the nineteenth century selected as typical of Early English, Decorated and Perpendicular characteristics. His choice has been approved by later authorities. But the records of the town do not reveal to us any item which extends our knowledge of the history of the building. We recognise the importance of the clergy of St. John when in the deed dated 1359, which is called the "Magna Charta of the Community," the twelve elected keepers of the town announce that, in addition to the common seal, they "for greater security thereof have procured the seal of the Venerable Canons of the Chapter of the Blessed JOHN of Beverley to be affixed." The building was a landmark that was often referred to as indicating limits, and, as the principal church, served its part in the life of the town.

When the various manors and lands belonging to St. John's, and valued at 1,000*l.* a year, were seized by HENRY VIII. the building fell into decay. A memorial was presented in 1552 to his successor praying that certain lands of the value of more than 60*l.* which did not form part of the sequestered property should be assigned for paying for reparation. It was, in truth, money bequeathed to uphold the building. The Chancellor and Council report that the Office of Works belonging to the Minster long possessed property of the value of 68*l.* 1*s.*, and with the profits the church was preserved. They also admitted that the church was very great and ruinous, and yet very necessary to be upholden, as Beverley was a market-town very notable and populous. But the property in question had been made over to royal favourites, the high and mighty prince JOHN, Duke of Northumberland, being one of them, and His Majesty EDWARD VI. therefore ordered that the twelve governors of Beverley were to receive 19*l.* 11*s.* 8*d.* out of the old chantry revenues, and the money was to be expended "upon the reparacions of the said church from henceforth yearly as necessity shall

require." A sum of 62*l.* 14*s.* 8*d.* was also given in lieu of the arrears. This robbing of PETER to pay PAUL casts light on the discreditable financial expedients which were adopted at the Reformation, and which were the cause of the ruin of many churches. The Minster Fabric Roll for 1447 contains some information about the building. An account of it appears in the "Transactions of the East Riding Antiquarian Society."

Another church is St. Mary's, which was once regarded as a chapel of St. John's. In 1520 there is an entry of a payment of 8*s.* 7*d.* to a goldsmith for exchange of a chalice which was broken when the church fell. Two years afterwards PETER CRAWE, draper, "graunted to pay xx markes toward the newe beyldyng of Saynt Mary Church now leyng in rewyne." The twelve governors were allowed 3*s.* 6*d.*, which they expended with the Master Mason (latomo) of the church, whence it may be assumed there was a consultation about the works to be undertaken, of which, however, the particulars are not forthcoming.

The Archbishop of YORK exercised much power in Beverley. He had his spiritual and temporal courts as well as a gaol. The Archbishop's hall was used for many purposes, weighing bread being one. He possessed water rights which were to some extent sacred. Presents were made to his lordship; in 1366 we read of 4*l.* 0*s.* 11*d.* for a pipe of wine, and in 1541, 4*l.* 5*s.* was paid for capons for him. The people also possessed their common hall, and in 1500 there was a purchase of a messuage in Crossgarthes for a new hall. In 1434 it was decided to dispose of some of the money received out of the land known as the "averys" for the building of a certain new hall on the Dyngs.

Whether the halls were used for the meetings of the guilds is not certain. There were not many churches in Beverley, and vestries could not serve for all the guildsmen. Mention is made of a meeting of all the venerable men in the chapter-house of the Minster, in order to consider whether a man could serve as one of the twelve governors if his son were in gaol as a suspected thief. The right to meet, like many other rights in which several had concern, was in Beverley under the control of the governors. It was prohibited in 1461, under the heavy penalty of 20*s.*, to hold assemblies or meetings in the houses of the friars or in other places. Numbers were not to gather in the Guild-hall unless duly summoned. The regulation was not unreasonable, especially as several of the trades do not appear to have been incorporated into guilds. The guilds of which there is evidence were those of merchants, cloth-workers, butchers, bakers, carpenters, smiths, tailors, skinnners, tanners, weavers, "sheremen," fullers, sailors, barbers, glovers, coopers, fishers, tilers, besides guilds which resembled religious confraternities. Each guild had its aldermen and seneschals.

The aldermen and their seyrssours or searchers examined all journeymen who sought work, unless they had been apprentices in Beverley. Those who were considered competent paid 4*d.* for examination fees, and all who failed were either to be bound as apprentices or to serve at lower wages.

The manner in which the Beverley trades were governed will, however, be better understood by taking a particular trade, the carpenters (with which some others were occasionally united), and describing the regulations. By an ordinance of 1461 it was settled that no carpenter, tiler, or plasterer who had not a regular apprentice with him was to employ a journeyman without the consent of the master with whom he worked. The latter could employ any journeyman he pleased, and finish a job begun by one with another man. Carpenters, tilers and their servants, sawyers, paviours and their servants and workmen, were to observe the following hours:—From Easter to the Assumption (August 15), from 4 A.M. to 7 P.M., with an interval at 6 A.M. of $\frac{1}{4}$ hour to drink, at 8 A.M. of 1 hour for breakfast, at 11 A.M. of $1\frac{1}{2}$ hour to dine and sleep, at 3 P.M. $\frac{1}{2}$ hour to drink. They were not to be tardy, or absent from their work, on pain of paying 12*d.* to the community. From the Assumption to Easter they were to begin at daybreak, and leave off when the light failed. At that season they might have at 9 A.M. $\frac{1}{2}$ hour to drink or breakfast, at 12 noon 1 hour to eat, and at 3 P.M. $\frac{1}{4}$ hour to drink. No carpenter, &c., was to refuse to work with any burges who

wanted him unless previously engaged on some other work; penalty 6s. 8d.

It was not always easy to draw the line between carpenters and other workers in wood, and in 1514 there was a lawsuit in which the carpenters, bowyers and other trades were parties. It was arranged that the carpenters were to withdraw their suit in London and the bowyers, turners, carvers and joiners their suit in Beverley. Every carpenter belonging to the guild was to be free to engage in carving, "enbowinge, rabbiting, jonyng and seelinge" without any contribution to the bowyers. But every carpenter occupied with making of "copburds, cownters, chists, awmbres or pressur" should yearly pay to the alderman of bowers for his contribution 8d. If he were not a brother of the guild the sum was to be raised to 20d.

The smiths were not allowed to use bad iron or steel. All work considered blameable by the overseers was to be forfeited, and a fine of 3s. 4d. imposed in each case. If a smith endeavoured to entice a servant from a brother smith, the alderman and stewards were to judge of the circumstances, and if their orders were not accepted the penalty was 6s. 8d. Any master of the craft who offered goods for sale on a Sunday was to pay 2s.

The goldsmiths as early as 1365 were obliged to make declarations that no silver of worse alloy than the current coin would be used by them. The issuing of any piece without their accustomed mark brought a penalty of 40d. Two "serchors" were appointed to ascertain that the gold and silverwork of Beverley was without fraud. Every goldsmith who did not satisfy the "serchors" was fined 12d., besides a similar sum for the maintenance of lights before the altar of St. DUNSTAN, the patron of the craft. On setting up shop for the first time 20d. was to be paid towards the light, as well as 10d. on employing a journeyman. If the lights prescribed for any trade were not ready at the stipulated time a fine was levied.

It was not only by contributing candles and torches to churches the guilds aided in ecclesiastical ceremonies. Beverley had acquired a remarkable organisation in the guilds for the production of pageants which illustrated scenes from Scripture. There are records of the following subjects:—

"Creation of the World," "Paradise," "Redemption of Adam and Eve" (le Coke Pageant), "Abraham and Isaac," "Three Kings of Cologne" (Epiphany), "Flight into Egypt," "Raising of Lazarus," "Sleeping Pilate," "Judgment of Pilate," "Crucifixion." There were also representations by particular trades of Pride, Covetousness, Luxury, Envy, Sloth, Anger, Gluttony, &c. Every craftsman was expected to contribute towards the expenses of the pageants, and to wear the appointed livery on the occasion, which was generally the feast of Corpus Christi. Should a craft remain unprepared a fine of 40s. had to be paid. Beverley possessed "properties" which were available by those who were not sufficiently organised or were too poor to purchase such aids. For instance, in 1391 the "hayrers" obtained the loan of the following objects, which JOHN OF ERGHES undertook to return after presenting the play of "Paradise," viz. one car, eight hasps, eighteen staples, two visors, two angels' wings, one pine pole, one serpent, two pairs of linen boots, two pairs of shirts, one sword.

The various trades used to erect wooden castles in connection with the pageants, from whence the spectacles could be witnessed. There is one curious entry of 1411, by which it was arranged that for the play of "Fleyng into Egip," as well as for "Habraham and Isaak," every brother should appear with a "fit bed-covering" ("cum coopertura lecti habili") at the castle on Rogation Monday. We may now smile at the simple efforts of the craftsmen to represent scriptural subjects, but the attempts aided in preparing people for the English drama, and were, moreover, useful to painters and carvers in suggesting composition as well as colouring. As in other affairs, plays were sometimes followed by fines. Thus in one year we find that the painters' alderman was fined 2s. because "Lez 3 Kyngs of Colleyn" was played badly and disorderly in contempt of the whole community in the presence of many strangers. The alderman of the tailors was mulcted in 12d. for that his play of "Slepyng Pilate" was badly played, against the ordinance made in that behalf; while the alderman of the

drapers was fined 2s. because of his play being badly played; 4d. of the same because his pageant was not covered with decent dresses.

Beverley had also its waits or minstrels, for whom not only liveries, but chains, escutcheons and collars were provided by the twelve governors. On account, no doubt, of the silver ornaments, the waits were required to find sureties. In the sixteenth century we find records of companies of players visiting the town. The Kyng's players and the Prynce's players arrived in 1541. In 1557 the Queen's players and Lord SKROOPE's players were to be seen, and at a later time the Duke of SUFFOLK's, Lord LEICESTER's and Master RICHARDSON's companies were received and rewarded. In that way life in Beverley must have been rendered less dull than in an earlier period.

From its position Beverley was compelled to sustain a competition with Hull, which nature had more liberally endowed with facilities for commerce. In the end Hull succeeded, but so long as it retains its Minster and its records, Beverley will retain its hold over architects and students of history.

THE SOCIETY OF ARCHITECTS.

THE annual general meeting of the Society of Architects for the session 1900-1 was held at St. James's Hall, Piccadilly, on October 24. Mr. Walter Emden, the retiring president, took the chair. The following officers were elected:—President, Mr. Silvanus Trevel, Truro; vice-presidents, Mr. Walter W. Thomas, Liverpool, and Mr. G. Gard Pye, London; hon. secretary, Mr. Ellis Marsland, London; hon. corresponding secretary, Mr. W. Cooper, Hastings; hon. treasurer, Mr. H. G. Quartermain, Merton; hon. auditor, Mr. J. Bartlett. The following members of Council were also elected:—Messrs. R. G. Bare, W. R. Bryden, C. Caine, J. W. Dunford, J. W. Dyson, W. L. Grant, W. J. Jennings, W. R. Mallett, G. A. T. Middleton, A. E. Pridmore, J. H. Richardson and W. A. Scott.

Messrs. C. Bagot, Clayton Botham, H. C. Lauder were elected members, and Mr. A. H. Weeks as student. The qualifying examination had been passed by Mr. A. L. Cox and Mr. R. G. Kirkly.

The hon. secretary read the seventeenth annual report of the Council, which stated that the past year had been one of progress and development. A large number of applications for membership had been received, resulting in the addition of twenty-three new members. The students' register had also increased, the total membership being 592, the highest yet recorded. Two members had died, fourteen had resigned and three had been removed from the list. Three studentships had lapsed. The half-yearly examinations to qualify for membership had attracted an increased number of applicants, of whom seven had been successful. One candidate, Mr. A. A. H. Scott, had been awarded the silver medal of the Society. The syllabus of examination had been revised and strengthened. The Council had continued its policy of keeping before the profession the question of statutory registration, and would not relax its efforts in working for a principle which it believed to be for the ultimate advantage of the public and the profession. In April last the Council passed a resolution urging that all architects who were British subjects should have an opportunity of submitting designs for the proposed Victoria Memorial. The committee with whom the matter rested, however, refused to alter its decision. It is expected that the balance sheet which will be presented at the November meeting will show that the surplus funds of last year have been considerably augmented; and although development must necessarily be attended by a corresponding increase in the expenditure, the working expenses of the Society will be found not to have increased out of proportion to the benefits which have been thereby secured to members and the Society generally. While the Society continues year by year to increase its membership and extend its influence, there is still plenty of scope for further efforts, and its resources can be developed and increased in proportion as the membership grows. The qualifying examinations and other restrictions as to entrance into the Society debar any but those properly qualified from admittance, and progress in numbers, if sure, is comparatively slow; therefore, it behoves the members to make a special effort to introduce those whom they know to be qualified to the privileges of membership or studentship, as the case may be, and the Council trust to have evidence of their wish to take a share in the development of the Society by receiving through their influence a greatly increased number of applications during the coming session. No report of the Council would at this time be complete without referring to the retirement from office of its president, Mr. Walter Emden, L.C.C., who for four consecutive years has so untiringly and generously devoted himself to the interests of the

Society, and the Council desires to place on record its appreciation of his ready and valuable services. The report was adopted.

The retiring President, who, in the unavoidable absence of his successor, remained in the chair throughout the meeting, expressed satisfaction that, after a hard struggle, the Society had been placed in a satisfactory financial position. The usual votes of thanks were adopted.

THE BRITISH SCHOOL AT ATHENS.

THE annual meeting of subscribers to the British School at Athens was held at the rooms of the Society of Antiquaries, Burlington House, on the 24th ult. Sir Richard Jebb, M.P., presided. The report of the managing committee stated that within the last few months the King, who as Prince of Wales had from the first taken a warm interest in the British School at Athens and given it his hearty support, had been graciously pleased to signify his continued desire for its welfare by becoming its patron. The work of the school, both on its teaching and on its exploring sides, had been energetically carried on during the past session under the newly-appointed director, Mr. Carr Bosanquet. The number of students in residence was five, as compared with six in the previous session. Mr. Marshall, who reached Greece in November, spent December and January in the museums at Athens and at Candia, working out a comparison of the Mycenaean remains from Crete and the mainland. In the course of this study he made most successful restorations of the unpublished vases from the Vapheio tomb and of some vases from a newly-found grave at Mycenae, which were entrusted to him for this purpose by Dr. Tsountas. Subsequently he travelled for some weeks in Eastern Crete and took part in the school excavations at Praesos during May, June and July. Mr. Hopkinson, who reached Greece at the beginning of December, spent most of his time in work upon the vase collections in the Athenian museums, devoting particular attention to the unpublished fragments from the Acropolis excavations. He also spent three weeks in Crete, partly at the museum in Candia and partly in the neighbourhood of Knossos, visited sites on the western coast of Asia Minor, and worked for a fortnight at Mykonos on the unpublished vase fragments from the excavations in Anti-Delos. Since his return to England Mr. Hopkinson had been appointed to the post of lecturer on Greek in the University of Birmingham. The new director, Mr. Bosanquet, reached Athens at the end of October, and returned to England at the end of August, thus residing altogether ten months in Greece, of which about six months were spent at Athens and about four in Crete. Mr. Bosanquet has marked the beginning of his term of office by submitting to the committee some valuable suggestions for the guidance of students at the school, which would, it was hoped, help to increase its usefulness as a teaching institution. Excavations were undertaken this year by the school at Praesos, situated on the central plateau of Crete, and at Petras on the coast, a few miles to the north. The work was conducted by the director, with the assistance of Mr. Marshall and Mr. Wells. Praesos was in historic times the chief centre of the Eteocretans, who represented the most primitive element in the population of ancient Crete, and it was therefore hoped that the excavations here might bring to light traces of civilisation of the Mycenaean epoch, together with inscriptions in the non-Hellenic and presumably Eteocretan language, of which one specimen had previously been found in this neighbourhood. The first hope was not fulfilled, for on the site of Praesos itself only one product of Mycenaean art was discovered, a gem found embedded in the mortar of a late Greek house, into which it must have been accidentally brought with the earth from some neighbouring tomb when the house was built. About a mile away, however, a large house of late Mycenaean work was discovered in a valley near a spring, and somewhat nearer the city were found two tombs of the same period, one a square chamber with a dromos, and the other a well-built beehive tomb. In the same neighbourhood a number of later tombs were opened, ranging from the Geometric period to the fourth century, and containing a large quantity of vases of various periods. Praesos itself appears from the remains discovered to have been an important place from the eighth or seventh century downwards. The most interesting objects were brought to light in a temenos on the top of a crag near the town. Here Mr. Bosanquet was fortunate enough to discover an inscription seventeen lines long in the non-Hellenic language referred to above, and written in Greek characters of the fifth century B.C. In the same place were found a series of votive offerings in bronze and terra-cotta. The terra-cottas, which range from the sixth to the fourth century, reveal the existence of a vigorous native school of art, and include the upper part of a fine archaic statue of a young god, half life-size, and a well-

preserved head with fragments of the body of a couchant lion. The remains of three other sanctuaries were also investigated. On a saddle below the Acropolis was discovered a large and solidly-constructed building of late Greek workmanship, with a front 75 feet long, which may, it is suggested, have been an "Andreion" of the kind in which the Cretan citizens met for common meals. The excavations at Petras on the sea coast brought to light considerable quantities of pottery of the Mycenaean period. The site appears, however, to have been systematically turned over and terraced by its owners a few years ago, and it was therefore not thought worth while to undertake here work on a large scale. Accounts of the discoveries at Praesos and Petras will be published in the forthcoming number of the annual. In the course of the past spring Mr. Loring, the hon. secretary of the school, returned from South Africa and for a time resumed his old post. But on receiving the offer of a commission in the Scottish Horse, he decided to go back to the seat of war. Mr. Loring was severely wounded in the right arm and leg in the attack on Colonel Kekewich's column last month. As the wounds, however, were not classed as dangerous, and Lieutenant Loring was among those who are described as doing well, the committee thought it probable, in the absence of detailed information, that the school might ultimately be the gainer by his earlier return to England. In this hope they renominated Mr. Loring as hon. secretary, and also nominated Mr. Mayor as acting hon. secretary until Mr. Loring's return.

Sir R. Jebb said that the British School at Athens was continuing to fulfil the purposes for which it was founded. It was intended to be a permanent station at Athens from which exploration in Hellenic lands might be conducted. It was to be at the same time a centre of regular training for students of Hellenic antiquity. And lastly, though this function was necessarily less definite, it was to serve as a sort of archaeological consulate for cultivated British visitors to Greece, a place where they could obtain advice and guidance as to the disposal of their time. The year which ended last summer was the fifteenth during which the school had performed this threefold office. The school had gained an honourable position among the other institutions at Athens, representing various nationalities which were engaged in the same pursuits, and its relations with them from the first had been of the most cordial character. Owing to the lack of general public interest in the matter the school had had in the past to contend with financial difficulties which only the aid of Oxford and Cambridge and the liberality of some private friends enabled it to surmount. The recent Government grant to the school had been a much-needed and well-deserved assistance, and was especially to be welcomed as a recognition of the fact that it was a public service to maintain the position of England in this field of scientific research, a field which engaged the energies of all the most highly civilised nations. During the past year the school had been doing its part in the latest researches. The centre on which the attention of classical archaeologists had lately been focussed was, without question, Crete. England had been represented there by two agencies—that of the Cretan Exploration Fund, and that of the British School at Athens. The work of the British School in exploring Praesos, on the central plateau of Eastern Crete, was carried on by the director, Mr. Bosanquet, with Mr. Marshall and Mr. Wells. It had had some positive results of great interest, chief among which must be placed the discovery of a second inscription in an unknown language, presumably that spoken by the old Eteocretan inhabitants, but written in Greek characters of the fifth century. While Crete had been the chief centre of interest, the year had not been barren of archaeological events in other parts of Hellas which were of interest for members and supporters of the British School. One, at least, of them deserved special mention. Professor Furtwängler had made a fresh examination of the temple in Ægina, and had ascertained that it was dedicated, not to any of the greater divinities, but to a local goddess called Aphaia. The dedicatory inscription had been found, and ran thus:—" . . . being priest," the name was mutilated, "the house was made for Aphaia; the altar and the ivory image were added; and the wall was made around it." The temple was dedicated soon after 490 B.C., replacing an older Doric temple of the sixth century. Attention might now be called to an old conjecture that in Herodotus, iii. 59, where a temple in Ægina was mentioned, the name of Aphaia should be read instead of that of Athena. There was no abatement, but rather an increase, in the activity with which Hellenic sites were being explored by the co-operation of various countries. The British School aimed at advancing knowledge. It also aimed at educating young archaeologists. The school at Athens and the recently opened school at Rome offered the best facilities available to our countrymen for a practical training in archaeological work. But they would all be of one mind in desiring that the educational work should be carried on without detriment to the energies of the school as an agency for exploration and for the advancement of knowledge. t

would be of great advantage to the director if he could command the services of another advanced archaeologist—or of more than one such colleague—to assist in conducting excavations and in editing the results for publication. They wanted something in the nature of an archaeological fellowship in connection with the school, to be tenable for a certain term of years. The appointment to such fellowship might rest with the managing committee in consultation with the director of the school for the time being. In selecting among candidates a preference might be reserved to former students of the school who could produce evidence of good work, but candidature should not be restricted to such students. Such a fellowship would be an object to which a student of the school might look forward as a possible opportunity of more advanced work. It would be a step towards organising a career for a man who possessed a genuine gift and love for such pursuits. It would also be a legitimate development of the school, bringing it nearer to the idea of a college of archaeology at Athens. The French School of Athens actually possessed much of that character. He threw out the suggestion rather as something that they might do well to keep in view, than as a proposal which there was any immediate prospect of realising. They might have to wait; but the fulfilment might be reached some day, possibly sooner than they could now foresee.

Mr. Arthur Smith seconded the report, which was adopted.

THE BISHOP OF RIPON ON "TASTE."

A LECTURE was delivered last week in Birmingham by the Right Rev. W. Boyd Carpenter, Bishop of Ripon, the president of the Birmingham Ruskin Society. His lordship described the aims of the Society as intended for the diffusion and promotion of the spirit of cultivation in the midst of the city. Taking an interest in the city, they recognised the difficulties and the temptations which were natural to civic life, and their wish would be, he imagined, to hold up before the citizens some lofty and worthy ideals. There was every reason for keeping alive the remembrance that a man's life consisted in something nobler than the mere accumulation of the means of subsistence, and the object of such societies which set before their fellow citizens the brighter and more beautiful side of life was most commendable. The purpose of the Society and the purpose of his address were, that while on the one side they recognised the duty of honesty and indefatigable and honourable toil in all the employments which fell to their lot in this great city, they were not unmindful of the beautiful and the graceful things; that they would be honest men on the one side—honest in work, honourable in toil—and on the other side men of taste. The range in which taste could exercise an influence was a range which touched every point and every portion of human life. That was not a quality which belonged only to a kind of fastidious refinement. It was the quality of life with truthfulness that he spoke of; for without absolute truthfulness of disposition a man would have but poor taste indeed. There was only one vulgarity in the world, and that was affectation, and there was only one high rule of taste, and that was absolute truthfulness. He could not say that taste belonged merely to the mind, and still less could it be said that it was a matter of conscience; but it was the pervading influence in all the departments of a man's life, and it made an immense difference to the method in which he dealt with his opinions and his principles. A man's taste became part of his equipment, and the moment they said he possessed good taste they gave him a recommendation, a testimonial of superiority; whereas a lack of taste implied a distinct lack of capacity, and not a momentary lapse of attentive power. Taste was an immense social power. Opinions were like the stones which made up the strength of the wall, but taste was like the mortar, which gave it coherence, consistency, and a pleasant and agreeable surface. The taste of the individual was the doorway which could be thrown open to give him the entrée into treasures which otherwise would be sealed to him. The world was so full of so many beautiful things that over and over again the pity of it was that so many things had been made with such wondrous fairness and so many were the multitudes whose eyes were blinded to their beauty. Often they thought that the best and the most beautiful things were put before them with the rich and prodigal hand of nature, and somehow or other there was the lack of capacity on their part to admire them. Then taste was the revealer of beauty to them, and when he pleaded that a society like the Ruskin Society was doing good service in that it promoted taste and the diffusion of taste he was not speaking in an unpractical way. The towns were growing fuller and the country emptier, and the town surroundings were such that the people were losing the capacity for enjoyment of the beautiful. He therefore urged in favour of the cultivation of taste because it was the unsealing of the eyes of men to behold and to enjoy the things that were beautiful. The custom of

having spring and autumn exhibitions of works of art was an admirable one, but he hoped that in addition to loan exhibitions there would always be in every great town permanent exhibitions, because the fleeting ephemeral education given by the casual spring and autumn exhibitions, good and well as it was, was almost lost unless supported by the continuous manifestation of beautiful works of statuary or painting all the year round to the eyes of the inhabitants. Passing to another aspect, the laws and principles of taste, he said the law of good taste was the law which governed and expressed the condition of harmonious relationship. It was absurd to talk about matters of taste and then not acknowledge that there were some fixed rules and standards. However difficult they might be to obtain, however wide they might be, there were still some standards or principles of good taste, and they might not unfairly be called laws of taste. The reason they resented law being introduced was because they loved their own freedom, but unless there was a really free individualism brought into their judgments in matters of taste all the laws would be of very little value. God's world was permeated by laws, and they lived by those laws. Law made nothing perfect, and they would never acquire good taste by the most intelligent understanding of the laws laid down by the great experts on taste. Taste was a subtle thing, part of themselves and incommunicable by mere instruction and the presentation of mere theories. It must grow as the best things grew, and if they wanted it to grow then it would grow into them if they lived amongst the men of taste, lived in constant fellowship with the great ones of the past. They could have communion with Dante, Milton, Shakespeare, Spencer, Tennyson, the demi-gods of the past and the great men of the present. They should live with them, make them their companions, open their ears and hear what they said, drink in the music of their verse, rejoice in the magnificence of their imagination, draw in by study their great lessons, and slowly there would be created in them that incommunicable thing that was called good taste.

LIVERPOOL CATHEDRAL.

THE following letter in addition to those already reprinted has appeared in the *Times* :—

From Mr. J. Oldrid Scott.

The controversy which is going on over the style of the proposed new cathedral is one of great importance to all interested in church architecture. As far as architects are concerned, it has so far been rather one-sided, and I hope you will allow me space for a few words which will be more or less in favour of the views held by the committee.

There are one or two points which seem to me to want clearing up. Some of your correspondents have assumed from Mr. Robert Gladstone's expressed admiration for Westminster Abbey that architects competing for the new cathedral are to be restricted to an imitation of that building. This would be an absurd mistake for the committee to make, but I doubt whether they have made it, for in the advertisement they have issued no such restriction is to be found. The word "Gothic" is used without any further limitation, and the full liberty desired by Mr. Graham Jackson seems to be given.

Mr. Reginald Blomfield first entered on the conflict to protest against Mr. Gladstone's use of the word "devotional." He assumed that it was the idea of the committee that Gothic architecture was *per se* more devotional than other styles; but surely Mr. Gladstone could only have meant that to us Gothic was the style most closely associated with devotion, and, considering that the great majority of Englishmen worship in Gothic churches, old or new, such a statement is absolutely true. It is curious that Mr. Blomfield in his taunt about devotion being connected with cusps and crockets falls headlong into the same error of confusing details with architecture which he condemns so fiercely in others.

Please let me add a word of protest against the statement that Gothic architecture is played out, and that its use now means nothing but a servile reproduction of ancient buildings. Nothing could be further from the truth. Look at the grand series of churches, culminating in Truro Cathedral, designed by Mr. Pearson; look at Mr. Bodley's noble churches, or Mr. Austin's, or Mr. Temple Moore's, all founded on a life-long study of old examples, but every one of them full of life and originality, and each of them carefully adapted to the requirements of the place it is built in.

The fact is that a critic is not in a position to decide authoritatively whether a building in any style is original or a mere reproduction unless he has acquired a close familiarity with that style. No one admires Mr. Blomfield's work more than I do, but I do not consider that his wide knowledge of one style qualifies him for condemning the works of those who practise in another.

I plead, as Mr. Graham Jackson does, for a Gothic design; but for one treated in the freest and most unfettered spirit. I plead for a design instinct with the sacred character which appeals to us in our glorious old cathedrals, but at the same time essentially modern in its treatment and adapted in all respects to the spiritual needs of a great modern city.

MANCHESTER ART GALLERY.

A MEETING of the Governors of the Royal Manchester Institution was held last week for the purpose of electing seven representatives on the art gallery committee of the Corporation. Mr. T. Worthington presided. The annual report stated that the question of the continuance of the right to nominate representatives on the art gallery committee had been again raised by the Corporation. A deputation from the Council of the Institution had had an interview with the Parliamentary sub-committee of the Corporation. As the proceedings seemed to offer a basis for an amicable settlement, it was trusted that the way might be cleared for the sub-committee of the art gallery which had been appointed to draft a scheme for the enlargement of the galleries and for the extension of the work of the art gallery generally. The existing galleries had been improved in various ways. The committee had continued the policy of purchasing works by deceased masters of the British school as well as works by living artists, and the list of bequests and gifts showed some interesting and important additions to the collection. Sir E. Burne-Jones's series of four oil-paintings *Pygmalion and Galatea* had been lent to the Gallery for twelve months by Mr. J. T. Middlemore, M.P. During the winter months interesting lectures were delivered under the auspices of the Institution by Mr. J. Ernest Phythian and Mr. Carl Armbruster.

Mr. T. C. Horsfall, in moving the adoption of this report, contrasted the condition of things in Manchester with Frankfort, where there was active co-operation between the leading citizens and the Town Council for the general good of the community. The members of the Manchester Institution had played the part of enlightened citizens working for the welfare of the community. The co-operation which had existed between them and the Town Council was now about to take a new form, and they hoped that before long a system would be adopted which would allow the work to be carried on upon a wider basis. It would be a good thing for Manchester if representatives of education and art from outside could be got to share with the governors the responsibility of co-operating with the municipal government in the promotion of art.

Mr. H. P. Greg pointed to the satisfactory increase in the attendance at the gallery on Sunday afternoons.

The Chairman mentioned that the total attendance at the Gallery last year was upwards of a quarter of a million.

The report was adopted. The seven representatives were elected as follow:—Messrs. T. Worthington, H. P. Greg, L. Schwabe, E. W. Marshall, J. E. Phythian, J. D. Milne and E. Salomons.

CHADDLEWORTH CHURCH, BERKS.

IT is stated by the Rev. Dr. A. Jessopp, rector of Scarning, Norfolk, that the church of St. Andrew's, Chaddlesworth, certainly stands upon the same site as that which was originally planted there more than a thousand years ago. It is not improbable that King Alfred, who died in 901, may in his wanderings—and remember, the king was born at Wantage seven miles off—have seen the "original" church of Chaddlesworth. There are indications that such a church did exist before the Norman Conquest, and proof positive that additions to that old church were made in the reign of William Rufus, or it may be earlier. The present tower appears to have been built in the thirteenth century as an improvement and enlargement of a smaller and older tower—with an entrance to the church on its western face. Chaddlesworth probably never had a pulpit from which sermons were preached till the seventeenth century. Sometimes sermons were preached from the rood-loft—a kind of balcony fixed on the top of the rood-screen which stretched across the church from north to south. Of the rood-screen he believes but a fragment remains. Sermons were also preached in the open air at the churchyard crosses occasionally. The Chaddlesworth cross, much mutilated, stands now where it must have stood for centuries. The circular font at Chaddlesworth is one of a type which belongs to very early times. The present chancel of the church is a good specimen of a structure in beautiful brickwork. It is probable that the earliest chancel was in the form of an apse. In the thirteenth century there was in many parts of England quite a rage for destroying these early apses and replacing them by rectangular chancels. Possibly the architect of the new chancel may have obtained his inspiration for the designing of the present chancel arch from some fragments of the ancient work which

he may have found in the foundations. The recent insertion of the east window in the church is a real enrichment of the sacred building, and by its subdued colouring, carefulness of drawing and softness of tone it helps to cast a calming and solemnising effect upon those who come to worship. The window is a gift to the church by Mr. William Cotesworth, of Chaddlesworth House, in memory of his son, Captain Hugh Cotesworth, R.N., who was in command of H.M.S. *Barraclouta*, and died very suddenly.

ADMIRALTY WORKS DEPARTMENT.

SOME important changes have just been made in the head office staff of the Admiralty Works Department. This department is responsible for the design and construction of all engineering and architectural works in the naval establishments at home and abroad, as well as for their care and maintenance. These works include docks, wharves, slips, breakwaters, dredging, barracks, hospitals, magazines, stores, workshops, dwellings, drainage, lighting and water supply, &c. The care and management of Admiralty lands and property is also dealt with in this department. The increase of the fleet during recent years has necessitated a corresponding growth in the shore establishments, and this has involved a large increase in the staff of the Works Department. With the changes lately made the authorised permanent staff of the department under the director of works is as follows:—Two assistant directors of works, from 850*l.* to 1,000*l.* a year (with an addition of 200*l.* a year to the senior). Engineering staff—Eleven superintending civil engineers, from 600*l.* to 700*l.*; twelve civil engineers, from 400*l.* to 500*l.*; twenty-two assistant civil engineers, first grade, from 300*l.* to 400*l.*; twenty-one assistant civil engineers, second grade, from 180*l.* to 300*l.*. Surveying Staff—One chief surveyor, from 800*l.*, rising to 1,000*l.*; six surveyors, from 400*l.* to 500*l.*; ten assistant surveyors, first grade, from 250*l.* to 350*l.*; nine assistant surveyors, second grade, from 125*l.* to 250*l.*; one surveyor of lands, from 600*l.* to 800*l.*; one surveyor of coast-guard buildings, from 500*l.* to 700*l.*; one clerk of works for coastguard buildings, from 215*l.* to 300*l.*. Many of these appointments carry in addition a house, London or colonial allowance. Entries to the staff are made in the lowest grades, viz. assistant civil engineer, second grade, or assistant surveyor, second grade, by open competitive examination held by the Civil Service Commissioners. The limits of age at entry are twenty-three to twenty-eight for the assistant civil engineers, and twenty-three to thirty for the assistant surveyors. Promotions are made by selection as vacancies occur, through the successive grades up to senior assistant, director of works and chief surveyor respectively. All officers of the staff are liable for duty either in London, at home stations, or at stations abroad.

SAXON CHURCHES.

A LECTURE was given on Friday at Normanhurst, by permission of Lord and Lady Brassey, by the Rev. Walter Marshall, M.A. He pointed out that the history of ecclesiastical architecture in Great Britain previous to the Norman invasion was veiled in partial obscurity because of the few specimens left. The best indications of pre-Norman work were to be found in the village churches. The main periods of Anglo-Saxon architecture were from 596 to 1045. There were several instances of early Saxon buildings in Ireland, and, speaking of their characteristics, he adverted to the effect of the Italian missionaries on the style of architecture, and added that, while there was no genuine architecture of the Anglo-Saxon period, it was an imitation of the contemporary art of Italy. Further, he spoke of the characteristics of the so-called Anglo-Saxon work, such as the "long and short" (which were probably the Anglo-Saxon interpretation of the Classical plaister, and not the result of the carpenter transferring his method of working from one material to another), the triangular heads to doorways and windows, the baluster shafts and lofty proportions. He went on to prove that the Anglo-Saxon heritage was ecclesiological rather than architectural, remarking that the Roman tradition was characterised by the apse, confessional, crypt and the wide chancel arch, and the Saxo-British tradition by the square east end, transepts lower than nave (such as the church at Worth, near Three Bridges), the central tower, single west tower, and the narrow chancel arch. The lecture was illustrated with some limelight views of various country churches.

Mr. Maurice Fitzmaurice, chief engineer of the Assouan Nile reservoir, and formerly resident engineer on the Blackwall Tunnel, has been appointed chief engineer to the London County Council at a salary of 2,000*l.* a year.

NOTES AND COMMENTS.

As several months have elapsed since we last referred to them, the proceedings against the parish priest of Montmartre on account of his new church may not be remembered. The old church which adjoins the immense building known as the *Sacre-Cœur* was treated as a dangerous structure by the municipal authorities, and is now scheduled as a historic building. The curé was therefore compelled to erect a new parish church, and he obtained a site nearer the base of the hill of Montmartre. M. DE BAUDOT was appointed architect. An immense crypt was first constructed and many of the artists of the district have adorned the walls with paintings. It is in use for services. The superstructure was next commenced. The architect decided on the employment of "ciment armé." When the walls were nearly raised the accident occurred at a bridge constructed, of the material at the International Exhibition. The authorities immediately became alarmed about the church and a special inquiry was instituted into the construction. The church was found to sustain all tests. Then the curé was summoned for undertaking building operations without lodging plans. He was fined 5 francs, but the question arose whether he should take down the building. The curé appealed for form's sake. Before the judgment of a higher tribunal was obtained an amnesty was announced, and he, "good easy man," believed his contests were over with secular authority. But that force does not easily succumb. The payment of 5 francs may not be demanded, but the prefecture with all its strength insists on the overthrow of the building, and for no more than a disregard of the common line of frontage. In England penalties are usually incurred for going beyond the line, but the Montmartre church is kept back from the line because the curé was possessed of sufficient land. In a case of this kind the interference of a superior power is demanded, but Paris does not possess one, and from red tapeism a costly and most interesting building is likely to be demolished.

THE adaptation of the Pavillon de Marsan in the Louvre has been sufficiently advanced to allow the Union Centrale des Arts Décoratifs to take formal possession of the building. The offices of the Union will not, however, be transferred until the beginning of next year. Meanwhile some of the collections will be installed, and a start will be made with the valuable collection of wood carvings which M. EMILE PEYRE spent many years in gathering. It is possible that collection will be seen by the public while the other parts of the new museum are being arranged. The Union already possesses so many examples of art it has required over nine hundred packing-cases to contain them. Indeed, there is so much property awaiting disposal, M. REDON, the architect, has found much difficulty in the carrying out of his plans.

THE following resolutions were adopted at the convention of the American Institute of Architects held at Buffalo from 3rd to 5th ult.:—(1) That a committee be appointed by the chairman, to consist of himself and four other members of the Institute, who shall study the question of a national art commission, report to the board of directors, and, with the consent of the board, petition Congress on behalf of the American Institute of Architects to create such a commission. (2) That a permanent committee on competitions, composed of three members, be appointed by the chair to give advice to those desiring information, and to induce reputable architects to refrain from entering improper competitions. (3) That a committee on municipal improvements, composed of three members, be appointed by the chair to co-operate with other societies having municipal improvements as an object. (4) That a committee of five, inclusive of the chairman, be appointed to secure the formation of a national bureau of architecture, under whose administrative charge shall be placed the architectural work of all the departments of the national Government, the work to be executed under a law similar to the Tarsney Act, which should, however, be mandatory and not optional. (5) That a committee of five be appointed by the chairman to organise a world's congress of architects, to be held in St. Louis in 1903 in connection with the centennial celebration of the Louisiana Purchase. (6) That one delegate from each of the national societies

of sculpture, mural painting, landscape architecture and civil engineering be hereafter invited to attend the annual conventions of the Institute; said delegates to have all the privileges of the floor, except that of voting. (7) That a committee of three be appointed by the chairman to ascertain the views of the members of the Institute as to the desirability of adopting in this country the metric system of measurements; said committee to confer with the superintendent of the Bureau of Standardising, and to represent the views of the members of the Institute before Congress.

THE office of architect to the French Ministry of Foreign Affairs is not a sinecure. The recent outbreak in China has necessitated the departure of M. CARRÉ, who holds that office, and he is now on his way to Peking. The buildings of the legation are in the state of ruin which the illustrated papers have shown, and which M. PIERRE LOTI has described in charming language. The French Ambassador and his assistants are compelled to put up with accommodation that cannot be considered as comfortable. Experience teaches, and western nations must be prepared for other attacks on their buildings in Peking. There is nothing sacred to a Chinaman in an embassy, and it will therefore be necessary to provide against ebullitions of savagery in the future. The plans which M. CARRÉ has prepared show that he has given some attention to military engineering, and they have had to be submitted to the experts of the Ministry of War. When he has completed his work in Peking M. CARRÉ will conduct operations in more civilised places, for his services are required at Washington and Vienna, as well as in London.

THE consequences of the unparalleled liberality of Mr. A. CARNEGIE will be various. In New York it has led to co-operation among architects of a novel kind. The trustees of the New York Public Library are enabled by him to erect no less than forty-two branch libraries in the city. The trustees, as a first step, have retained Messrs. McKIM, MEAD & WHITE, Messrs. CARRERE & HASTINGS and Messrs. BABB, COOK & WILLARD to design and supervise the construction of the buildings, with the exception of one which, it is expected, will be constructed from designs furnished by Mr. JAMES BROWN LORD. It has been arranged that the three firms of architects will act in collaboration and decide jointly all matters of common import regarding the designs and construction and other details relating to the buildings. At the same time the designing of each building and the supervision of its construction will be entrusted by allotment to one or other of the firms. In that way it is anticipated there will be secured individuality of design, while having the combined judgment of several skilled architects. But it is not impossible that Mr. LORD's library may be the most successful, for co-operation does not always insure inspiration.

FOREIGNERS when visiting Paris rarely venture on a journey to the Place Royale, although it deserves a visit as a survival of the time of HENRI IV. It has borne many names. It was changed in 1792 to the Place des Fédérés, and in 1793 to the Place de l'Indivisibilité, in 1799 to the Place des Vosges, in 1814 it resumed the old title, in 1848 it was again the Place des Vosges, and in 1854 the Place Royale. Madame DE SÉVIGNÉ was born there, and it has had many celebrities among its tenants. VICTOR HUGO lived in No. 6, which he maintained was once the residence of MARION DELORME, and in the house it is intended to establish a museum which will be devoted to relics of the poet. On the first floor will be a collection of pictures and engravings illustrative of his works; on the second his designs and the pieces of furniture made by him will be placed; the third will be a reconstitution of the room in which he died; while in the rooms on the fourth floor will be various books and documents relating to him.

HERTFORD.*

HERTFORD, which gives its name to the county and hundred in which it is situated, is the county and assize town of Hertfordshire, and is also a municipal and parliamentary borough. The borough comprises an extent of nearly six square miles. From a very early period Hertford has been a place of considerable importance; it is said to have been the site of a town of the Trinobantes, and subsequently to have been one of the places of residence of the kings of Essex. As

standing in front of the library, and which I pointed out to you, was planted by Sir George Faudel-Phillips, to celebrate the jubilee of our late lamented Queen.

The Castle.

From the earliest historical times this was a royal manor, the inhabitants being, as I have said before, tenants in burgage, and paying taxes direct to the king. The castle, commenced by Edward the Elder, was materially strengthened by William the Conqueror, who granted further privileges to the burgesses, and had coins minted within the royal borough. He committed the custody of the castle to Peter de Valoignes or de Valence, one of his principal Norman followers, from whom it came to his son, Roger de Valence, who died, leaving issue Peter and Robert. The former, who succeeded his father, died without male issue, whereupon the governorship of the castle came to his brother Robert, who had an only daughter and heiress, Gunora, wife of Robert Fitz-Walter. Though this Robert Fitz-Walter afterwards became governor of the castle, he does not seem to have obtained a *jure uxoris*, for in the year 1202 Richard de Munfichet, sheriff of Essex and Herts, was governor. King John visited the castle on four occasions. The history of the castle since 1212, the many attacks upon it, the changes that were made from time to time in the governorship of it, is a matter of history, but far too long for my paper.

Henry VIII. seems to have frequently visited Hertford, and at one time to have contemplated making it a Royal residence, and Prince Edward was residing at the castle when his father, Henry VIII., died. In 1561 Queen Elizabeth visited the castle and remained there sixteen days. She also contemplated making Hertford a Royal residence, having expended considerable sums in restoring the

castle, but though she was a frequent visitor she never resided at Hertford for any length of time. She granted arms and a charter to the borough.

Of the original castle but little now remains, the greater part of the ruins which survived to the commencement of the present century having been demolished by the Marquess of Downshire, the then tenant of the mansion. A portion of the ancient building, however, is still to be seen about 60 yards to the east of the present building, and some fragments of towers, a mound and an embattled wall. The last, however, is nearly complete, and it is partly Norman. There is also a gate remaining. A mansion was built on the site of the castle about the time of James I. by Sir Henry Hobart, but it has been so often and so much restored and added to that but little of the original character remains. Before the completion of the college at Haileybury it was occupied by the East India Company as a training school for their civil service. It is now the residence of Mr. A. McMullen, by whose kind permission we have visited the place to-day.

All Saints Church.

The old church of All Saints, which was burnt down in 1891, was undoubtedly ancient, as there is a record of a vicar

early as the year 673 a National Synod was convened in Hertford, under Theodorus, Archbishop of Canterbury, the object being to assimilate the forms of Christian worship throughout the various dioceses, and to frame laws for the better government of the Church in England. At a later period Hertford and the surrounding neighbourhood were held by the Danes; their vessels being of light draught were enabled to pass up the Lea from the Thames as far as Hertford, where the Danes are said to have erected a fortification on Port Hill. No indications of a camp now remain. By the facilities which their ships afforded they were enabled to hold their position here after the main body had been defeated by the Saxons, in the west. King Alfred determined to drive them out of their stronghold, and had recourse to stratagem for that purpose. At a shallow part of the Lea, near Waltham, he divided the stream into several channels, so that there was not sufficient depth of water to float the Danish vessels. Being thus cut off from reinforcements, the Danes fell easy victims to the Saxon soldiers.

About the year 905, Edward, the elder son of Alfred, erected a fortress in the town near the site of the present castle, and eight years later he commenced building the town on both sides of the river Lea, and subsequently created it a borough. The householders were thereafter called burgesses, inasmuch as they paid an annual rent to the king, and held in burgage.

Passing on to the time of William the Conqueror, we find Hertford a place of considerable importance, with two churches, three mills and 146 burgesses, as set forth in Domesday Book, but I must leave the further history of Hertford, interesting though it is, as time will not permit me to dwell upon it, and I will now confine myself to the places visited to-day; suffice it to say that the town is full of interest, and has very many quaint old buildings.

On leaving the railway station, and shortly before entering the principal streets, and by the side of the public library, I pointed out to you a drinking fountain erected from some of the stones saved from the church of Great St Mary; those stones are of great beauty and the fountain quite unique; it deserves a more prominent position, but it stands, as also does the library, upon the site once occupied by Great St. Mary. Within the hall of the library there are some more stones, also saved from the same church. The oak tree

* A paper by Mr. Thomas Stock, read at Hertford on October 12 before the members of the Upper Northwood Athenæum.

THE ANCIENT ENTRANCE TO HERTFORD CASTLE.

NORMAN WALL OF HERTFORD CASTLE.

who was appointed in 1248, but it appears it had but little pretension to architectural beauty; it is, however, said to have been commodious. There were two galleries for the use of the boys and girls attached to Christ's Hospital and there were also several ancient monuments. The building which we have to-day visited stands on the site of the old one, and when finished will be a church of good dimensions.

St. Andrew's Church.

Old St. Andrew's Church was an ancient but dilapidated structure, utterly devoid of architectural merit, and only accom-

Luscombe, who formerly officiated at the church, was over the altar at the old church, and it has been placed in the new church in a less prominent position. The old original doorway and holy-water stoup I pointed out to you.

In the side chapel there is a stone pre-Reformation altar, which was brought from the church of St. Mary the Great when that building was demolished. The register of the parish dates from 1560.

I am indebted for most of my information to Cussan "Hertfordshire," Murray's Guide, and a guide by an old inhabitant.

PARGET WORK IN FORE STREET.

modated about 300 persons; it was therefore demolished, and the church we have to-day seen was erected in its stead, the first stone of which was laid by Earl Cowper in June 1869. The church was consecrated by the Bishop of Rochester in March 1870. It is, as you will have noticed, a handsome and commodious building. The style is Transitional—the period between Early English and the Decorated. A statue of the patron saint (St. Andrew) is in a niche over the entrance in the north porch, and was placed there at the expense of a lady resident. A very good painting of Our Saviour and two of His Disciples, the gift of the late Bishop

Balls Park.

The priory of the Blessed Virgin Mary at Hertford was founded by Ralph de Limesey, a nephew of William the Conqueror, who bestowed it, with detached portions of land at Hertford, on the abbots of St. Albans. He eventually became a monk and was buried in the priory church. In the reign of Edward I. the borough of Hertford was represented in Parliament by Simon de Balle, who seemingly resided on a portion of the priory land, and gave his name to the estate now known as Balls Park. At the Dissolution the "Manner of Harfield Priory" was sold by Henry VIII. to Anthony Denny and John

s wife. From their son Edward it was purchased in 1578 by John Docwra, and from him it passed to Martin Trott. A later owner of the manor was William Henmarsh, of Balls, and by the marriage of his daughter Jane, the property was conveyed to Richard Willis; and in 1626 we read that he died seized of a tenement called Balles." Their eldest son, who was created a baronet in 1641, had previously sold the estate to Sir John Harrison, Knight, who in the reign of Charles I. built, as Chauncey states, a "fairish" brick structure in the middle of a garden. Chauncey describes it as having every side equally ornamented and exactly uniform, with ceilings wrought with several distinct patterns of fretwork, with the steps in the great staircase wainscotted in panes, and with the hall paved with black and white marble. With the exception that the central quadrangle has been roofed over, the house remains unaltered.

predicting these motions for all past and future time. It has measured not only the dimensions and determined the elements of our planetary systems, but it has also made no small progress towards a knowledge of the dimensions of the sidereal system and of the amount and direction of our sun's motion through space. It has catalogued the stars to a high order of magnitude, and determined many facts as to their distribution in space. There is no subject to which higher genius has applied itself than that of the unravelling of the celestial motions and the laws which govern them. Thus the old astronomy, from the difficulties of her task, the beauty and precision of her methods and the proved accuracy of her predictions, has earned for herself the acknowledged position of queen of the sciences. But her task is by no means ended, for the so-called old astronomy

THE TUDOR GATEHOUSE.

under date of April 15, 1643, Evelyn wrote, "Near the town of Hertford I went to see Sir J. Harrison, his house new built." Balls Park continued the home of the Harrisons until the middle of the eighteenth century, when it passed by marriage to Charles, third Viscount Townshend, who was Secretary of State to George II. Much of the furniture in the house is of his day. Balls Park, with its 1,500 acres, which were included in the manor of the priory, remained the property of the Marquess of Townshend until it was acquired by Sir George Audel-Phillips, Bart., G.C.I.E., D.L., J.P., and ex-Lord Mayor of London, who very kindly permitted our visit to-day.

The illustrations are from photographs kindly lent by Mr. Robert Thornton Andrews, of Hertford.

OBSERVATORIES AND THE NEW ASTRONOMY.

CAPE COLONY is the theatre of war, but in the capital, amidst all the anxieties, Sir David Gill, the Astronomer-Royal, as becomes a British Archimedes and his staff, continue to enrich science with their observations. A telescope, which cost 10,000*l.*, has been presented to the Observatory by Mr. McClean, of Rusthill, Kent, and a sum of 14,000*l.* has been expended on the erection. On September 26 the memorial tablet was unveiled by the Governor, when the following address was delivered by Sir David Gill:—

The ceremony which I am about to ask Your Excellency to perform is one regarding which some explanation seems to be necessary. We all understand the significance of the laying of a foundation-stone or the formal opening of a new building, but it is evident that the function of to-day represents neither the one nor the other. Your Excellency will therefore, perhaps, permit me to enter into a short account of the origin and the history of this great telescope, and of the Observatory under the name of which we are now assembled. If in so doing I appear first somewhat discursive, I trust to be forgiven on account of the interest of the subject and of the occasion. Until about thirty years ago the science of astronomy concerned itself chiefly with the positions of celestial objects. It occupied itself with the observation of their apparent places in the sky, tracing the origin of their motions and finally computing and

still provides, and for ever will provide, a boundless field for research and for exercise of the highest efforts of the human intellect. Sixty years ago no one believed it possible that astronomy could embrace the study of the constitution as well as the motions of celestial objects. It is true that the speculations of Laplace seemed so well based and to fit so well with known facts and scientific possibilities as to afford the belief that the sun and planets had been evolved from common primeval matter. But Laplace's views could only be regarded in the light of a hypothesis; they were not capable of that proof which is necessary to raise speculation, however plausible, to the level of scientific truth.

Comte, in his "Cours de Philosophie Positive," expressed the opinion of his time thus:—"We may speculate with some hope of success on the formation of the solar system, of which we form a part, for it presents to us numerous perfectly well-known phenomena, susceptible perhaps of giving proof of its true immediate origin. But what, on the other hand, could possibly form a rational basis for our conjectures on the formation of other suns? How confirm or disprove by the evidence of phenomena any cosmogonical hypothesis when no phenomena of such a kind are known, nor doubtless are even knowable?" In other words, the philosophic dictum of sixty years ago was that the chemical constitution of other systems than our own is a subject which, from the nature of things, must be regarded as unknowable.

But the discovery of the lines in the solar spectrum by Fraunhofer, the interpretation of the meaning of these lines by Kirchhoff and Bunsen, and the application of the spectroscopic method to other celestial objects have upset that philosophic conception of the unknowable and given to us the new astronomy.

This new astronomy deals not so much with the position as with the constitution of celestial objects. Its aim is not so much to answer the question, "Where is such a star?" but "What is it?" "What can we find out about its chemical constitution and the chemical history of its development?" But with all this distinctive difference between the new and the old astronomy, it is impossible to divorce the one from the other. There is perhaps no finer illustration of the correlation of the physical sciences than is to be found in the outcome of this new development of astronomy. The old astronomy required the combined efforts of the optician, the mechanic, the engineer, the observer and the mathematician for its

pursuit; the new astronomy adds those of the physicist and the chemist, and we are every day finding out not only how each and all of these branches of science contribute to the advancement of astronomy in general, but also how their common application to astronomy has contributed to the advancement of these separate sciences.

I may perhaps be permitted to dwell briefly on this most interesting subject. The fact that light travels with a measurable velocity was first demonstrated by Roemer in 1675, because he found that the eclipses of Jupiter's satellites apparently occurred too soon when the earth is near Jupiter, and apparently too late when far from Jupiter—a phenomenon that could only be accounted for on the assumption that light travels with a measurable velocity. Here, then, is a notable contribution by the old astronomy to the science of physics.

Newton, as everyone knows, showed how sunlight, after passing through a slit and a prism, is split up into its component colours. Fraunhofer, in 1815, proved that this spectrum, or coloured ribbon, viewed with more perfect appliances than Newton employed, is crossed by fine dark lines; in other words, that certain very definite kinds of refrangibility, or colours of light, are wanting in the solar spectrum. Fraunhofer actually measured the position in the spectrum of 600 of these lines, but their significance remained a mystery until 1859, when the explanation was found by Kirchhoff and Bunsen. They showed that substances in a state of incandescent vapour absorb rays of the same refrangibility as they themselves, when sufficiently heated, emit, and that the dark lines in the solar spectrum are produced by the absorption of vapours of metals, &c., which exist in the solar atmosphere, many of them being the same as those with which we are familiar; such as iron, calcium, sodium, magnesium, hydrogen, &c.

With this discovery the new astronomy sprang into life. Sir William Huggins, the president of the Royal Society, was the first to apply in a really crucial and scientific manner this new engine of research to other systems than our own. With infinite labour and ingenuity he designed and had constructed a spectroscope applicable to analysis of the light of celestial objects. It was requisite that this spectroscope should be mounted on a telescope, so that the comparatively faint light of a star might be collected by the object-glass and be projected at its focus on a slit of one or two-thousandth parts of an inch in width, and be retained steadily on that slit in spite of the diurnal motion of the earth. Further, it was necessary to provide means by which the infinitely small point of light formed by the star's image should be widened, so that there should be seen in the field of view not a mere coloured line, but a coloured ribbon of appreciable width. Finally, means had to be contrived for introducing into the slit, just as if it had come from the star, the light given off by terrestrial substances in a state of incandescence, so that the dark lines in the spectrum of the star might be compared with the bright lines of the spectra of terrestrial substances. The labour of overcoming all these difficulties was great, but great also was the reward. To use Huggins's own words:—"The time was indeed one of strained expectation and of scientific exaltation for the astronomer almost without parallel, for nearly every observation revealed a new fact, and almost every night's work was red-lettered by some discovery."

Time does not allow me to proceed in the order of history, nor to classify the work done by Huggins and his successors. The spectra of vast numbers of the stars were shown to be identical with those of the sun, the spectra of others were less complex, of others more so, but all contained evidence of the existence of chemical substances which are contained in our globe. As powerful telescopes had shown many objects, previously supposed to be only nebulous, to consist of separate stars, the belief naturally began to be held that all nebulae were in reality distant systems of stars which would be seen as such if only adequate optical means and sufficiently clear and steady atmospheric conditions were available. But Huggins's spectroscope showed that many nebulae were not stars at all, that many well-condensed nebulae, as well as vast patches of nebulous light in the sky, gave only bright lines in the spectroscope—lines which proved that such nebulae were not stars at all, but inchoate masses of luminous gas.

Evidence upon evidence has accumulated to show that such nebulae consist of the matter out of which stars (*i.e.* suns) have been and are being evolved. The different types of star spectra form such a complete and gradual sequence (from simple spectra resembling those of nebulae, onward through types of gradually increasing complexity), as to suggest that we have before us, written in the cryptograms of these spectra, the complete story of the evolution of suns from the inchoate nebulae onwards to the most active sun (like our own), and then downwards to the almost heatless and invisible ball.

The period during which human life—nay even life of any kind—has existed on our globe is probably too short to afford observational proof of such a cycle of change in any particular star, but the fact of such evolution, with the evidence before us, can hardly be doubted. I most fully believe that when we

have further studied the modifications of terrestrial spectra under sufficiently varied conditions of temperature, pressure and environment, our certainty of the fact will be greatly increased. But in this study we must also have regard to the spectra of the stars themselves. The stars are the crucibles of the Creator; there we see matter under conditions of temperature and pressure, the variety of which we can hardly hope to emulate in our laboratories, and on a scale of magnitude beside which the scale of our greatest experiment is less than that of the drop in the ocean.

I believe also that we must look to the new astronomy for aid in the solution of many great chemical problems. The astronomer of the new school has to thank the physicist and the chemist for the foundations of his science, but the time is coming—we almost see it now—when the astronomer will repay the debt by wide-reaching contributions to the very fundamentals of chemical science. Thirty years ago there was first observed in the spectrum of the sun's chromosphere a very remarkable bright yellow line, near the position of the well-known D lines of sodium. So distinctive was this line, and so certainly not due to any known terrestrial substance, that it was called the helium line. In 1894 Lord Rayleigh, who was engaged in determining the densities of the principal gases, found what was then to him an inexplicable difference between the weight of a volume of nitrogen prepared from atmospheric air and the weight of the same volume of nitrogen prepared from ammonia or by any other chemical means. Repeated experiment showed that the weight of the constant volume of atmospheric nitrogen was about 1.200 part greater than that of the chemically-prepared gas. After exhausting all means of testing the purity of the chemically-prepared nitrogen, Lord Rayleigh and Professor Ramsay, in January 1895, finally traced the cause of their perplexity to a hitherto unknown gas present in our atmosphere, which they named argon. Here was a great chemical discovery due to the co-operation of the physicist and the chemist. On the publication of this paper, Mr. Meirs, of the British Museum, directed Ramsay's attention to a paper by Hillebrand in which the author had found that the mineral uraninite contained nitrogen, and Ramsay naturally was desirous of examining every source of nitrogen. Accordingly he boiled cleveite—a uranite of lead containing rare earths—with weak sulphuric acid, and, after collecting the evolved gas, he found that its spectrum gave not only the now known argon lines but also new lines, one of which, to Ramsay's intense surprise and delight, absolutely coincided with the helium line, which had been known for twenty-six years in the spectrum of the solar chromosphere. Of course, as soon as helium was prepared its spectrum was thoroughly studied, and then Lockyer and McClean were quick to show that many of the lines, which occurred in the spectra of a large class of stars, were due to this same helium. Here was another chemical discovery in which the astronomer and the chemist were mutually helpful—a discovery also that is yet destined to throw much light on the evolution of stars.

One more illustration and I am done.

The study of the phenomena of light has compelled the conviction that light is the result of vibrations or waves in ether, as sound is the result of vibrations in air; and that just as slow and rapid vibrations of air produce respectively low and high pitched notes, so do slow and rapid vibrations of ether produce red and yellow or blue and violet light respectively. If now one imagines one's self standing beside a railway track and that an engine comes along sounding its whistle, it is clear that as the engine approaches the bystander more waves of sound of the whistle would reach the ear in a second of time than if the engine were at rest. As a consequence of this, if the engine is travelling at a rate in any way comparable with the velocity of sound a sharper note will be heard than if the engine were at rest; on the other hand, if the engine is running away from the bystander the pitch of the whistle will for a like reason be lowered. The matter is easily put to the test by anyone who chances to be beside a railway track when an engine blowing its whistle is approaching at high speed; the instant that the engine passes a sudden lowering of the whistle-note will be perceived. If one had a tuning-fork emitting the exact note given by the railway-whistle when at rest, it would be possible with the aid of another suitable fork that could be tuned to the note of the moving whistle, to determine the velocity of approach or recession of the train from the difference of the number of vibrations per second between the two forks. Just in the same way, if one knew the exact wave-length of a particular line in the spectrum of a star, and if we observe the wave-length of the same ray as it reaches the earth we have a means of determining the velocity of approach or recession of the star, provided that the velocity of the star's motion has a measurable relation to the velocity of light. Doppler pointed out this possibility in 1841, but it was not until Huggins had begun stellar spectroscopy that about 1865 his attention was directed by Clerk Maxwell to this possibility of the new astronomy, and that in 1866 Huggins made the first

attempts to determine motions in the line of sight. Such a task was, of course, impossible until the lines in the star spectra had been identified with those of known terrestrial substances, and as it would have been impossible for an observer to determine the velocity of a railway train at any moment by means of the note of the whistle that reached his ear, unless the observer also had a tuning-fork emitting the same note as the whistle of the engine when at rest. But Huggins had already identified many star lines with those of terrestrial spectra, and so far was in a position to attempt the task. He showed in 1866 that such work was possible, but it required the application of photography (first used for this purpose by Vogel), an exhaustive study of the theory of the spectroscope, and the greatest refinement in its construction and its use, to give the new engine of research the requisite reliability. These preliminary difficulties are now overcome, and daily results of the greatest importance are being added to our storehouse of knowledge.

It would occupy too long were I to enter on the numerous problems to which this branch of the new astronomy is applicable, but it will be evident how great an advantage to astronomy must be this new power to determine, not, as formerly, only angular velocity at right angles to the line of sight, but the actual linear velocity of motion in the line of sight itself. These examples, which I fear I have quoted at too great length, enable me to explain in a few words the full significance of the ceremony which we have assembled to-day to witness.

Until the year 1894 there existed, neither at the Cape nor at any observatory of the Southern Hemisphere, any adequate equipment for pursuit of the new astronomy, nor was there apparently much hope of the need being supplied. For forty years the new astronomy had been vigorously prosecuted in the Northern Hemisphere; the first great harvest of results, obtainable with moderate means, had been reaped and great establishments were founded for research in the new field of work. It became thus obvious that, if anything was to be done to equalise the possibilities of research in both hemispheres, no small outlay would be required. On my appointment as Her Majesty's Astronomer in 1879, Mr. Newall, who then possessed the largest telescope in England, offered the loan of it for a period of years to prosecute research in the new astronomy at the Cape, but it was considered by the authorities at home that the cost of its transport and the erection of a suitable building and dome could not be entertained unless the telescope might remain permanently the property of the Observatory. Mr. Newall had good reason for limiting his offer to loan, for his son, then a young man, gave promise of scientific tastes, and he is now using that instrument at Cambridge, and obtaining with it the most refined spectroscopic results that have yet been secured in England.

The busy years rolled on, and I had almost resigned myself to the idea that, during the period of my directorate, at least, the Royal Observatory at the Cape must limit itself to the pursuit of the old astronomy, for which purpose it was well equipped. But in 1894 arrived a letter from Mr. Frank McClean offering to present for use in the Southern Hemisphere, and preferably to the Cape, a telescope and observatory, the specification for which corresponds with the instrument now before us and the building in which we are now assembled. Mr. McClean further stated that the optical part of the instrument had been for some time under construction by Sir Howard Grubb, of Dublin, and the whole would probably be completed before the end of 1896. The new instrument was also to be fitted with object-glass prism, spectroscopes, &c., so that upon the completion of all the Cape Observatory might enter on the pursuit of the new astronomy with every advantage possible in the way of equipment. Here was indeed a revival of hopes almost dead, of ambitions almost abandoned. The value of the gift was, if possible, enhanced by the fact that Mr. McClean is himself a distinguished worker in astrophysics. One had seen his splendid photographs of terrestrial spectra, one knew something, but not all, of the great work on which he was then engaged, viz. of obtaining inter-comparable spectra of all the stars to the $3\frac{1}{2}$ order of magnitude, and one felt that his gift was due solely to a clear and well-founded perception of the needs of science and of an earnest and helpful desire to fulfil them. The Lords Commissioners of the Admiralty accepted with warm appreciation of Mr. McClean's generosity the offer of this splendid instrument, and expressed the view that its possession would greatly increase the utility of the Cape Observatory, and might be expected to result in considerable advancement to science.

The year 1896 saw the observatory building ready for reception of the telescope and the dome erected. In the following year Mr. McClean visited the Cape, attached his object-glass prism to our photographic telescope in the adjoining building, and was thus enabled to complete that remaining portion of his spectroscopic survey of the whole heavens which could not be completed from his own observatory in Kent. His work at the Cape was also memorable by his discovery of the

existence of oxygen in the spectra of a certain class of stars, and for this discovery and his spectroscopic labours generally he was awarded the gold medal of the Royal Astronomical Society of London in 1899.

With the fullest expectation that the instrument would be erected during 1897, Mr. McClean had ordered the inscription stone which your Excellency is about to uncover to be cut. It was not until April 1898 that forty-four cases containing the telescope arrived from Dublin, nor until November of the same year that all was complete and ready for testing. Then another disappointment was in store. The large object-glass was, after exhaustive trials, found to be defective in some particulars, and at the request of Sir Howard Grubb it was sent to Dublin in October 1899 for correction, and was not returned to the Cape until early in the current year. The insertion of the inscription-stone had been delayed until the telescope might be regarded as complete, and it is only within the past two or three months that the final tests have assured us that this may now be regarded as the case. It remained only to wait for a fitting time and occasion to perform the ceremony of uncovering the stone, a gracious office, which you, sir, have kindly undertaken to perform to-day. It will be found, when you have done so, that the stone bears the inscription "The Victoria Telescope," and the date 1897, the year when the donor intended that the telescope should be completed and this ceremony performed. It is named the Victoria Telescope in honour of the great and good Queen whose jubilee it was intended to celebrate, and to whose beloved memory only it must now stand. I venture to hope it will long remain to honour that memory, and to fulfil, by useful work, the noble intentions of its large-minded donor.

ST. BARTHOLOMEW'S HOSPITAL AND CHRIST'S HOSPITAL.

A SPECIAL general court of the governors of St. Bartholomew's Hospital, summoned by the treasurer and the almoners, was held on the 25th ult. at the institution. Sir Trevor Lawrence, the treasurer, occupied the chair, and there was a very large attendance, nearly 120 members of the governing body being present. The proceedings were private, but a correspondent has furnished the following report to the *Times* :—

On the motion of the Lord Mayor, seconded by Sir T. Lawrence, a resolution was passed electing the Duke of Cornwall and York a governor, and subsequently His Royal Highness was elected president of the hospital in succession to the king, an office which he had held for thirty-four years, and which he only relinquished on his accession to the Throne. His Majesty afterwards honoured the institution by becoming its patron, a position which had never previously existed.

The court next proceeded to consider a circular letter of the members of the medical staff advocating the purchase of the entire site of Christ's Hospital, about five acres in extent, which the governors of that institution have stated that they value at about 700,000*l.*

The question of the acquisition of this site or a part of it has given rise to much controversy, and a lengthy memorandum bearing on the financial aspect of the proposal was circulated among the governors by the treasurer and almoners. In the last Session of Parliament compulsory powers were conferred on the governors to acquire a portion of the site, consisting of about an acre and a half, adjoining the boundary of the hospital and extending from Little Britain into Giltspur Street; but the purchase of the whole of the site has been urged by the medical staff, who contend that the area proposed to be brought under the Act referred to is altogether inadequate to the requirements of the hospital. The governing body, it is stated, have been and are in accord with the views of the medical staff in desiring to obtain possession of as much additional land as the funds of the institution will allow them to purchase, but they have felt that they could not prudently undertake any further responsibility than that involved in buying the acre and a half referred to and in erecting certain buildings thereon. They state that this would mean an expenditure of from 250,000*l.* to 300,000*l.* at least, and that the whole of the hospital's prospective increase of rental for more than thirty years would thus be absorbed.

Alderman Sir H. E. Knight proposed and Mr. John Hill seconded the following motion :—

"That a special committee be now appointed and that they be instructed to make careful inquiry in regard to the resources and financial position of the hospital, and also as to the alterations and additions and other improvements now urgently needed in regard to the accommodation afforded by the present site and buildings in order to place the hospital in the best position to meet the requirements of the day as to the proper treatment of all patients; and having regard to such improvements and additions to which attention may be directed by the

medical staff, and all others which are urgently needed in order to make the hospital in every respect efficient for the treatment of patients and otherwise. And, further, to make full inquiry as to all matters appertaining to the extension of the site of the hospital, with the object of reporting to the governors and affording them such information as will enable them to consider and decide as to the purchase of the site of Christ's Hospital or any part thereof, with any suggestions and plans they may think it expedient to submit on the whole matter referred to them, and that they be authorised to require the services of all the officers of the hospital, and to confer with the medical staff and others, to enable them to report to the governors fully and authoritatively, and to incur such necessary expenses as may be approved by the treasurer, not exceeding a total of 300*l*."

The resolution was declared carried unanimously, with an addition appointing the treasurer, the four almoners and seven other governors to act as the committee.

A letter has been addressed by Sir Trevor Lawrence to the governors of St. Bartholomew's Hospital apropos of the issue to them by Sir Sydney Waterlow, the former treasurer of the institution, of copies of five letters which were written by the latter last autumn to Sir Trevor Lawrence. To these communications Sir Trevor states that he sent replies at the time, but he explains in the present letter why they were "mostly brief and imperfect, and certainly not such" as he would have written for communication to the governors. Sir Trevor Lawrence criticises at some length Sir Sydney Waterlow's method of arriving at the result he "wishes to prove, that the funds at the governors' disposal are sufficient to enable them to purchase the whole site of Christ's Hospital." The following are the concluding passages of Sir Trevor Lawrence's letter:—

"Sir Sydney estimates the value of the site of Christ's Hospital at 600,000*l*., but he seems to think that it might be obtained at an arbitration price of 570,000*l*.. The governors of this hospital have power, under their Act of last session, to acquire 1½ acres at a price to be fixed by arbitration; but there is no reason to believe that the governors of Christ's Hospital would consent to arbitrate as to the price of the remainder. Their statement on oath before the committee of the House of Lords was that they had declined an offer of 700,000*l*., and had subsequently received another offer of 720,000*l*.. . . As to the necessity for increased space, in addition to the 1½ acres which the hospital has the power of acquiring, there can be no doubt that it would be highly beneficial to obtain as large an area as possible. Open space attached to hospitals is always desirable, and it cannot be denied that the greater the space available the more thoroughly and satisfactorily can the hospital requirements be met. But one of the reasons urged by Sir Sydney as a need for rebuilding cannot be supported, namely, that the buildings 'must be more or less saturated with disease arising from occupation by persons suffering from all kinds of illnesses.' Indeed, it should be stated that the senior physician not long ago informed the treasurer and almoners that, in his opinion, our medical wards are of the best in London. Besides which, if the insanitary condition suggested by Sir Sydney existed, it would be shown in the condition of the patients. The statistical results entirely negative Sir Sydney's suggestion. The question of extended site really resolves itself into one of money. . . . Sir Sydney is of opinion that the public will respond to an appeal for funds for the purchase of the entire site, and his confidence in the success of such an appeal is such that he considers the hospital would be 'justified in taking some risk'—a risk, be it observed, involving an outlay, according to his own estimate, of 600,000*l*.. He believes that, because the public have contributed largely to other hospitals, and notably to the London Hospital, they would therefore subscribe to a fund for the extension for this hospital's site. Contributions from the public would be gladly welcomed and greatly appreciated, but it is impossible to lose sight of the fact that the circumstances of this hospital, and those of other hospitals, are widely different. With the single exception of St. Bartholomew's, every hospital in London is constantly obliged to put forward appeals for money to meet pressing needs and prevent the immediate closing of beds. Such appeals meet in some instances, but by no means in all, with a ready response. What the public would say to an application from this hospital, on such pleas as are now put forward, can be the subject of very speculative opinions only. But if they should fail to respond satisfactorily after the governors were committed to the payment of no less a sum than 600,000*l*., the hospital would be landed in grave financial disaster. If the public are willing to subscribe money for this purpose their help will be most gratefully accepted, and additional land can be bought to the extent of their contributions. When Sir Sydney Waterlow states that 'the redemption money to replace the purchase-money at the end of fifty years would at 3 per cent. compound interest amount to only 886*l* 11*s*. per annum for each 100,000*l*.,' he omits to mention that, in addition to this 'redemption money,' interest to the amount of 3,000*l*. per annum would have to be

paid, making a total of 3,886*l*. per annum for each 100,000*l*. It is said (October 12, 1901, page 10) that the hospital is so rich that 'a large part' of its annual income has been accumulated. The value of this statement may be gauged by the fact that since the year 1888, when the governors resolved to provide as far as possible for the purchase of a portion of the site of Christ's Hospital by carrying from time to time to a 'reserve fund' all surplus income beyond that required for current expenditure, the total sum saved, with its accumulated interest, has amounted to 44,695*l*., equivalent in these 13 years to 3,438*l*. per annum. This is the only provision that it has been possible to make towards an expenditure, to which the hospital is now committed, of probably upwards of 300,000*l*. It must be added that it was Sir Sydney Waterlow himself who, at the special general court on July 4, 1900, moved the resolution, which was carried unanimously, adopting the report of the treasurer and almoners recommending the purchase of only an acre and a half of the site. In that report, which was issued to every governor before the meeting, the views of the medical staff regarding the purchase of the entire site were fully set forth in their own words, and an explanation was given why the treasurer and almoners considered the acquisition of the whole site impracticable on financial grounds. It was also Sir Sydney Waterlow who, when as treasurer he was responsible for the financial affairs of the hospital, settled and drew the line defining 'the strip of land' extending from Little Britain to Giltspur Street, which he thought it desirable for this hospital to acquire from Christ's Hospital, which 'strip of land' is practically identical with the acre and a half for the acquisition whereof compulsory powers have just been obtained from Parliament."

ST. SAVIOUR'S CHAPTER-HOUSE, SOUTHWARK.

ON Monday last the Bishop of Rochester opened a chapter-house for St. Saviour's, Southwark. The building which has been acquired for the purposes of the Chapter was originally the chapel of St. Thomas the Martyr, which was founded in 1213. It is situated in St. Thomas Street, Southwark, in the neighbourhood of Guy's Hospital. Since the building has been taken over by St. Saviour's it has undergone several alterations, and has been thoroughly cleaned and decorated. A feature of the house is a fine old oak gallery which runs round the northern and western walls. The reredos and communion-table, also of oak, have been allowed to remain, and the old chapel seats have been broken up and utilised for the purpose of panelling the walls. The building is fitted with the electric light, and is amply furnished with new chairs.

The Bishop of Southwark, in asking the Bishop of Rochester to open the chapter-house, said that it was some years ago that the Chapter of their collegiate church entrusted him with the task of adapting the building to the purposes of a chapter-house, to serve not only as their meeting-room, but also as a central hall for other diocesan gatherings. This had not been accomplished without hindrances. They had to obtain their Act of Parliament, and church Acts were not readily passed, besides which they had had other difficulties. The origin of the building was interesting. The present structure was erected in the first year of Queen Anne as a chapel for St. Thomas's Hospital and the precincts by the celebrated treasurer, Clayton, whose residence was now their collegiate house. It was a great question whether the chapter-house was ever a consecrated building. In all their negotiations the Hospital of St. Thomas, as represented mainly by Mr. Wainwright, had treated them with the utmost consideration. One of their many little difficulties arose from the unwillingness of the Post Office at first to part with the space under the gallery which now formed the corridor leading into the Foster Hall. In that case Mr. Watson Smythe showed that officials had human kindness behind their red tape. The most interesting history of the house was anterior to the days of Queen Anne, and it was in more remote ages that its first connection existed with the collegiate church. St. Saviour's, or St. Marie Overie, had, as was usual, a building within its precincts devoted to hospital work. In 1207 the church was nearly destroyed by fire, and negotiations were opened with the Abbot of Bermondsey for the purchase of a plot to the east of London Bridge for their accommodation. They were now on that spot. When the brethren went back to their restored church they turned their temporary quarters into a hospital and dedicated it to the then fashionable saint, St. Thomas à Becket. That was the origin of St. Thomas's Hospital, and when they came to rearrange the chapter-house they found some portions of the wall which the Southwark canons had built in those past days. The purchase of the chapter-house and the acquisition of the building restored the ancient connection between that place and St. Saviour's, which had been interrupted by the confiscation of Henry VIII. The Church of England was the most ancient corporation in the

realm, but it must live in modern days and fit itself in London to the moving problems of twentieth-century life, and he hoped that that ancient house, which dated its connection with St. Saviour's back to the days of the Crusades, would throb with new vigour and be the centre for many movements for the ennoblement of South London life. Another interesting point to those who were endeavouring to form a worthy cathedral library, the nucleus of which was to be seen in the gallery, was that in 1527 the Southwark clergy encouraged James Nycolson, who had signed the contract for the magnificent series of windows at King's College, Cambridge, to print a Bible dedicated to the king by Miles Coverdale. That early printing press was set up within the precincts, just as Caxton's had been at Westminster. There and at Bishop's house should centre all their diocesan gatherings. They ought no longer to go into the diocese of London to find a council-chamber. The munificence of Mr. Forster had given them the long room next to the chapter-house for smaller meetings. There was another small room upstairs for committees, and when their councils were over there was the great church in which to sanctify their labours by prayer and praise. In conclusion, he referred to the labours of Mr. Arthur Bartlett, the architect, and Mr. Morgan, the treasurer; to the donors, Sir Frederick Wigan, Mr. Forster, Lord Llangattock, Mr. H. Lloyd and others who had made the work possible; and to the Ecclesiastical Commissioners, especially Mr. Porter, who had made the building theirs.

The Bishop of Rochester, in declaring the chapter-house open, said that the day was a happy one in the history of the building up of a cathedral centre for South London. That history had a starting-point in the past, and he was of opinion that it had a goal in the future. At the outset they had the work of that good and great man, Bishop Thorold. Certain names were prominent in the progress of the work in connection with the chapter-house, and to those which the Bishop of Southwark had already mentioned he would add that of Mr. Robert Barclay. They owed a great deal to Canon Taylor, and he was expressing what they all wished to say when he said that the name of the Bishop of Southwark was most prominent on account of his care and diligence, perseverance and tact, in carrying the work to completion. He had proved the value and the necessity of a central church for South London. The work which had been done in the building was simple, and they wanted simplicity and strength in their labours in South London. It was a pleasure to him to think that next week they were to hold their diocesan conference there. The building was to be used for chapter-house purposes and as a place for Church advice and counsel. A feature of the Chapter which they had formed in the cathedral church was that they had included lay members. There was strength in the support of lay members, and he trusted that in the work of the diocese and the Church they would be able to increasingly secure the common action of clergy and laity.

On the proposition of Mr. P. J. Waldram, seconded by Mr. A. H. Tyler, a motion was passed authorising the Council to make arrangements to further the speedy exchange of technical information between the members themselves and between the members and the discussion section of the Architectural Association. Mr. H. B. Vorley brought forward a motion in favour of the creation of a reserve fund, but after some discussion it was withdrawn.

TESSERÆ.

Indian Pottery.

IN the best Indian pottery we always find the reverent subjection of colour and ornamentation to form, and it is in attaining this result that the Indian potter has shown the true artistic feeling and skill of all Indian workmasters in his handiwork. The correlation of his forms, colours and details of ornamentation are perfect and without seeming premeditation, as if his work were rather a creation of nature than of art, and this is recognised, even in the most homely objects, as the highest achievement of artifice. The great secret of his mastery is the almost intuitive habit of the natives of India of representing natural objects in decoration in a strictly conventional manner; that is to say, symmetrically and without shadow. In this way the outline of the form ornamented is never broken. The decoration is kept in subordination to the form also by the monotonous repetition of the design applied to it, or by the simple alteration of two or, at the most, three designs. Also, never more than two or three colours are used, and when three colours are used, as a rule two of them are merely lighter and darker shades of the same colour. It is thus that the Indian potter maintains inviolate the integrity of form and harmony of colouring, and the perfect unity of purpose and homogeneity of effect of all his work. The mystery of his consummate work is a dead tradition now; he understands only the application of its process, but not the less must it have been inspired in its origin by the subtlest interpretation of nature. The potter's art is of the highest antiquity in India, and the unglazed water-vessels made in every Hindu village are still thrown from the wheel in the same antique forms represented on the ancient Buddhistic sculptures and paintings. Some of this primitive pottery is identical in character with the painted vases found in the tombs of Etruria, dating from about B.C. 1000. It is interesting to find that pottery is still made all over India for daily use which is in reality older than the oldest remains we possess of the ceramic art of ancient Greece and Italy. None of the fancy pottery made in India is equal in beauty of form to this primitive village pottery, and most of it is utterly insignificant and worthless.

Anachronisms in Pictures.

Great objections have been urged against the earlier painters, and also against Raphael, for introducing in their representations of the Madonna and Child the portraits of people living in their own times. But whatever appearance of anachronism there may be in such a practice, in reality there is none. The representation of the divine characters in the picture is not that of the real, but solely of their ideal presence, as they are supposed to have appeared in the minds of the human persons introduced; and if it be objected that they are not shadowy enough to fulfil this idea of their nature, it must be remembered that the creations of fancy, whether in the waking thoughts or in the dreams of sleep (especially the latter) take the actual form and colour of living nature; and the introduction complained of serves to strengthen the impression which the artist sought to convey, namely, that the sacred presence is a vision and not a reality. The charge of anachronism against the Venetian painters cannot be so easily removed, but forget the mere title of the subject, and their works possess every quality necessary for the embodiment of the truth and beauty of nature in its highest state of perfection. Nor were the ideal qualities wanting in Titian, whilst Tintoretto in this respect almost surpassed every other artist of whatever school. Amongst the innumerable martyrdoms of saints which oppress us in Italian and Spanish art there is no picture which can be compared with the *Massacre of St. Peter Martyr*, by Titian; it may be almost pronounced perfect, and it shows that the artist was eminent in all the qualities that combine to make a great painter.

Variety in Art.

When the painter and sculptor had advanced so far in their art as to be able to imitate exactly the form of the human body, it could not well be long before they applied themselves to particular imitations of it. Some forms are beautiful, others not. They would study therefore to imitate the former, and perhaps endeavour to investigate what circumstances constituted the difference between such cases. The imitation of the beautiful, from the imitation of mere form, was itself a great step in the art, but was of still greater consequence in leading

THE INSTITUTION OF JUNIOR ENGINEERS.

THE annual general meeting of this Institution was held on Friday night at the Westminster Palace Hotel. Mr. Percival Marshall occupied the chair. The secretary (Mr. Walter T. Dunn) read the annual report of the Council, which stated that the total membership at the close of the session was 652 as compared with 594 for the previous year, an increase of 58. The number of elections had been 103, which was the largest figure yet recorded. During the year the deaths had taken place of Professor G. F. Fitzgerald, an honorary member, Mr. L. F. Awde, a member of the Council, and Mr. E. H. S. Cooper, a member who had served as a Volunteer in the South African war, and after recovering from severe wounds had died from enteric fever. The Institution premium had been gained by Mr. Samuel Cutler, jun., and a special prize offered by Mr. W. H. Northcott for a paper dealing with the relations of employers and employed had been awarded to Mr. William Powrie. The third series of lectures organised by the Institution had been given, the subject being the management of engineering workshops. New offices had been taken at 39 Victoria Street, Westminster, where the accommodation included a library and reading and writing-rooms. Eleven visits to engineering works in London and the neighbourhood had taken place during the session. Sir John Jackson had consented to serve as President of the Institution. The income for the past year had amounted to 495*l.* 7*s.* 7*d.*, and the expenditure to 475*l.* 0*s.* 1*d.*, leaving a credit balance on the year's working of 20*l.* 7*s.* 6*d.* The balance-sheet showed a balance of 150*l.* 9*s.* 10*d.* in favour of the Institution. The report and statement of accounts were adopted. The following officers were elected:—Chairman, Mr. Percival Marshall; vice-chairman, Mr. Kenneth Gray; hon. librarian, Mr. Lewis H. Rugg; hon. auditors, Mr. H. B. Vorley and Mr. W. H. de Ritter; secretary and treasurer, Mr. W. T. Dunn.

to another. Beautiful forms were more beautiful in one attitude than in another, under the influence of some passions or affections than under the influence of others. To imitate such objects, therefore, it was necessary to study not only the general beauty of form, but such attitudes and expressions as were the signs of such passions or affections. The most beautiful forms in real life were still in some respects deficient, and it was difficult to find instances where such forms might display the most beautiful attitudes or expressions. The imagination of the painter or the sculptor could alone supply this want; he would endeavour by degrees, therefore, to unite the beauty of form with the beauty of expression, and would thus gradually ascend to the conception of ideal beauty, and to the production of form and of attitude, more beautiful than any that were to be found in nature itself. In these various steps the uniformity of the earlier ages would insensibly be deserted. Beautiful attitudes have little uniformity, and in the expression of passion or affection every variety of form must be introduced which takes place in real life. The artist, therefore, would not only be under the necessity of introducing variety, but the admiration of the spectator would necessarily keep pace with its introduction; both because the expression which his forms now assumed was of itself much more pleasing and interesting than the mere expression of design, and because this variety was in fact now significant of greater skill and dexterity in the artist than the mere uniformity of the former age. In those arts, therefore, variety of form would not only be considered as expressive of design, but, as what distinguished the old and the modern school was the uniformity of the one and the variety of the other, it would be considered as the peculiar sign of elegant or of improved design.

Ancient Porphyry Quarries.

At Gebel Dokhán, in Egypt, are those vast quarries from which Rome took so many superb pieces of porphyry to adorn her baths and porticos. The chief difficulty in working these quarries was the want of water. It was removed by sinking two wells, one of which must have cost immense labour, being a shaft of about 15 feet in diameter, sunk in a solid porphyry rock. It is now impossible to judge of its depth, being much filled up with earth, but there is still some distance to the spring; the actual depth of that part where it is solid rock is 38 feet, and much more must be allowed for a good supply of water. It has a cistern attached to it, from which are led troughs for the cattle. The other well is more filled up, being altogether only 22 feet deep, with a diameter of 15 feet; that part which is still visible is cased with stone. It is placed on one side of a circular space, which was perhaps once covered in by means of a roof supported on pillars, five of which still remain. On them are scratched boats and various figures, also a few Greek letters above a cross. This last is near the town which the Arabs call Bélet Kebeer, or the large village; the other is a ten minutes' walk distant, and in another valley.

Memorial to the late James Brooks.

SIR,—From several quarters it has been brought to my notice that a feeling exists that steps should be taken to raise some memorial to the late Mr. James Brooks, F.R.I.B.A. This on account of the work he has done for the Church at large in many localities. I am led to indite this on account of what he did for St. Faith's—a church designed by the late Mr. Burges, at whose death Mr. Brooks completed on his own responsibility its western portion, and under his immediate care or that of his son, Mr. Martin Brooks, he carried out many additions and improvements, e.g. vestries, porch, &c., and at the time of his death he was erecting the lady chapel.

For the last twelve years, with one single intermission, he has acted as churchwarden of St. Faith's, and for the last six continuously as vicar's warden.

It seems therefore natural that the memorial should be erected in St. Faith's. Various objects have been mentioned, e.g. chancel-screen, west window to be filled with stained glass, screen between the church and the chapel, also an institute with caretaker's house. I should be glad to have the views of your readers on the subject, but I feel the selection of the object must depend very much on the amount of subscriptions received, and, secondly, on the wishes of Mr. Brooks's own family.

Subscriptions may be sent either to Mr. W. Jenkinson, 147 Albion Road, the parish warden, or to myself.

C. H. V. PIXELL.

St. Faith's Vicarage, Stoke Newington.

GENERAL.

The Opening Meeting of the Royal Institute of British Architects will be held on Monday next. During the session the following papers will be read:—"Mosaics," by R. Anning Bell; "The Palace of Knossos, Crete," by A. Evans; "The Architectural Discoveries of 1901 at Stonehenge," by D. J. Blow; "Baldassare Peruzzi," by F. W. Bedford; "The Planning of some recent Library Buildings in the United States," by S. K. Greenslade; "Inlay and Marquetry," by W. Aumonier and Heywood Sumner; "Tradition in Architecture: its Function and Value," by A. N. Paterson, M.A.

Mr. R. G. Hetherington, M.A., will read a paper before the Society of Engineers on Monday next, the subject being "The Main Drainage of Ilford."

Prof. Wm. E. Ware, of Columbia University, has been retained by the Pennsylvania Capitol Commission to advise it in matters relating to new plans for the State capitol.

The Edinburgh Dean Guild, in granting a warrant for erecting buildings in London, complimented the architect, Mr. Alexander Law, on the accuracy and completeness in detail of the plan he had presented to the Court, and said it would be a great convenience were all architects to take the same pains in drawing plans.

The Emperor of Germany has sent an envoy extraordinary to the Pope in order to present the first volume of the history of the Sistine Chapel, by Professor Steinmann.

Professor P. Geddes will deliver to-morrow a lecture before the Dundee Institute of Architecture on "The Glasgow Exhibition: its Results and Lessons."

Mr. B. W. Leader, R.A., and his works will be the subject of the Christmas number of the *Art Journal*.

A New Church will shortly be commenced in Berlin for the use of Americans. The fund has now reached ten thousand pounds.

The Italian Council of Public Works has authorised the municipalities of Florence and Pisa to utilise for the supply of drinking water to those cities sources belonging to private persons, declaring them to be of public utility.

A Royal Palace of the Mycenaean period has been discovered at Phaistos in Crete. As yet few relics have been found in the explorations.

A New Church for Bible Christians is to be erected in the Old Shoreham Road, Brighton. A site has been secured.

Tenders for the proposed Cardiff Asylum are not likely to be invited until September, 1902.

The Parish Church of Lyminster, near Arundel, is about to be repaired at a cost of 400*l*. The north wall of the nave is in a very unsafe condition, and the tower is also in need of restoration.

The Truro Cathedral Building Committee have reported to the Diocesan Conference that serious anxiety had been caused by signs of fracture in eight of the bases of the nave piers, and before undertaking a reparation recommend that an expert should be called in.

Professor R. A. Smart has resigned his appointment in Purdue University, to become head of the department of experimental engineering recently established by the B. F. Sturtevant Company, Boston, to investigate problems relating to blower practice.

The General Purposes Committee of the Surrey County Council, having considered the proposed allocation of the cost of 72,000*l*. for purchasing Marble Hill to save the view from Richmond Hill, have agreed to the suggested payment of 10,000*l*. by their Council, but have decided to recommend that this shall only be done subject to the adoption of the scheme for securing Petersham Meadows to the public for ever, which is also mentioned in the circular letter of the central committee.

A Monument has been erected at Eamont Bridge, near Penrith, in memory of Troopers Hudson and Todd, of the Imperial Yeomanry, who were killed in action at Faber's Pont. It was designed by Mr. W. Grant Stevenson, R.S.A., of Edinburgh, and consists of a carved stone Celtic cross with bronze portraits of Hudson and Todd on the shaft.

The Ceremony of turning on the water at Annan in connection with the completion of the laying of a duplicate pipe from the reservoir to the filters was performed on the 24th ult. by Lady Reid. This scheme, which cost 8,000*l*., provides for the better water supply to the burgh and district. Mr. Copland, C.E., Glasgow, was the engineer, and Messrs. J. S. Millar & Son, Annan, were the contractors.

Mr. John H. Genn, town clerk of Falmouth, died on the morning of the 25th ult. The deceased gentleman held several public offices in the town, including those of magistrates' clerk, clerk to the Board of Guardians, and superintendent-registrar of births and deaths for the district. The late Mr. Genn was well known throughout the West as a keen sportsman, and at one time captained the Cornwall football team.

THE

Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BARNSELY.—Nov. 22.—Competitive drawings are invited for the adaptation of property situate in Pitt Street, Barnsley, for union and relief offices, &c. A premium of 20*l.* will be awarded for the accepted design. Mr. C. J. Tyas, clerk, 17 and 19 Regent Street, Barnsley.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive designs for laying-out about 12½ acres of land as ornamental grounds. Premium of 20*l.* offered for the selected design. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive plans for an isolation hospital. Premium of 25*l.* offered. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BURSLEM.—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100*l.* and 50*l.* will be awarded to the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes

upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

KINGSTON-UPON-THAMES.—Nov. 14.—Designs are invited for a new public library. Mr. Harold A. Winser, town clerk, Kingston-upon-Thames.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be, subject to certain stipulations, paid to each competitor, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

STOCKPORT.—Nov. 4.—Designs for the municipal buildings which the Corporation propose to erect are invited. Mr. Robert Hyde, town clerk, Stockport.

VOLUME LXV. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered. Price 13s.

SOUTHEND-ON-SEA.—Nov. 12.—For an addition to the Sutton and Shopland National schools. Mr. W. Vendall Hobbiss, architect, 57 High Street, Southend-on-Sea.

SOUTHTAWTON.—For erection of a farm bailiff's house and other work at Wood, Southtawton, Devon. Mr. James Jerman, architect, 5 Bedford Circus, Exeter.

SWINDON.—Nov. 12.—For supply, delivery and erection of electrical machinery and plant. Mr. Robert Hilton, town clerk, Town Hall, Swindon.

SWINDON.—Nov. 12.—For supply of electric machinery and plant as follows:—Contract No. 2, comprising three Lancashire boilers and economiser, two jet condensers, feed pumps, pipework and accessories; (3) water-cooling tower; (4) 10-ton overhead travelling crane. Mr. Robert Hilton, town clerk, Town Hall, Swindon.

WALES.—Nov. 12.—For reconstruction of bridges and other works at Newtown goods yard, Cardiff, for the Great Western Railway Co. Mr. G. K. Mills, secretary, Paddington Station, W.

WALES.—For additions to warehouses in Millicent Street, Cardiff. Mr. Edgar G. C. Down, architect, 31 High Street, Cardiff.

WALES.—Nov. 19.—For erection of new sliding glazed partitions, new desks and sundry other works at the Garn schools, Blaenavon. Messrs. Lansdowne & Giggs, architects, Metropolitan Bank Chambers, Newport, Mon.

WALES.—Nov. 22.—For erection of new Wern Board schools, Ystalyfera, and new Ynysmeudw infants' Board school, Pontardawe. Mr. W. Watkin Williams, architect, 63 Wind Street, Swansea.

WALES.—Nov. 22.—For erection of house, out-offices and boundary walls, &c., at Newbridge, near Ruabon. Mr. W. H. Johns, Vroncyssyllte, Llangollen.

WASHINGTON.—For alteration to the Railway tavern, Washington, co. Durham. Mr. Geo. Stephenson, 20 Collingwood Street, Newcastle.

WHITBY.—Nov. 6.—For erection of a church and school at Whitby. Mr. W. G. Smithson, architect, 13 Bond Street, Leeds.

WILLESDEN.—Nov. 12.—For supply and erection of complete electric plant. Mr. E. T. Ruthven-Murray, electrical engineer to the Willesden Urban Council, Public Offices, Dyne Road, Kilburn, N.W.

WIMBLEDON.—Nov. 20.—For construction of new concrete sewage precipitation sludge and storm-water tanks, sludge pumps, cast-iron mains, valves, floating arms, penstocks, &c., at the sewage works, Durnsford Road. Plans and specifications can be seen and bill of quantities obtained at the Council Offices, Broadway, Wimbledon.

WOOLWICH.—Nov. 6.—For erection of a gardener's cottage upon the site abutting on Cemetery Road, Wickham Lane, Plumstead. Messrs. Church, Quick & Whincop, architects, William Street, Woolwich.

MARYPORT Harbour Commissioners find it impossible to promote a Bill in Parliament during the forthcoming session to carry out the harbour improvement scheme, as the consent of the Court of Chancery cannot be obtained in time.

WITH a view to avoiding a future water famine, such as has only narrowly been escaped this year, the Bradford authorities propose to erect a storage reservoir at Angram, and the water-works engineer, in explaining the position, states that the normal consumption of water per day in the city and out-towns may be set down at 14 million gallons, and assuming that the rainfall and gathering ground would, under usual and ordinary circumstances taken over the year, give this quantity, then in order to be able to secure and distribute it over all the days of the year, a storage capacity of 2,520 million gallons is needed. As a matter of fact, however, the aggregate storage capacity of all the reservoirs, impounding and service, is only 1,660 million gallons, a deficiency of 760 million gallons. It is therefore plain that no time should be lost in adding to the storage capacity of the works. The Nidd Valley scheme provides for the construction of three large storage reservoirs on the river Nidd at High Woodale, Lodge and Angram, with a total storage capacity of 2,596 million gallons, and it is desirable that the first of them, viz Angram reservoir, should be gone on with as quickly as possible. This would add 810 million gallons to existing storage, and when completed would comprise nearly one-third of the total storage provided for the Nidd Valley scheme. The Angram reservoir and the works connected with it will take seven or eight years to construct, and at the end of that time, most likely before it, Bradford will be using to the full the direct supply from the Nidd, and ready to utilise the further increased supply which the Angram reservoir will afford.

THE CUNDALL PATENT OIL ENGINE

COPY OF LETTER.

THE GREAT WESTERN HOTEL,
OBAN: October 29, 1900.

DEAR SIRS,—I have very great pleasure in testifying to the efficiency of the 20 H.P. Oil Engine which you supplied for driving the Dynamo, which gives current of equal H.P. for lighting and Motors in the Hotel. The Engine has now been in use almost daily for over three months, without the slightest hitch. It gives the utmost satisfaction and the most favourable results.

Practical men who have seen the Engine working pronounce it to be the best and smoothest working they have seen.

What I think is one of the features of your Engine is that my man can start it without any assistance. Most Oil Engines I have seen were difficult to start, taking three, four, and sometimes six men to start them.—I am, yours faithfully,

ALEX. MCGREGOR.

THE new sewage works at Halifax were officially opened on the 29th ult. by the mayor (Alderman W. Brear). The scheme, which is capable of dealing with over 4,000,000 gallons of sewage per day, has so far cost close upon 50,000l. It is estimated that when complete the cost will reach 80,000l.

THE MAY-OATWAY FIRE ALARM

Simple, Inexpensive, and Reliable.

Licensed by H.M. Postmaster-General.

St. Dunstan's Church has just been seriously burned, and it may be the turn of St. Paul's or Westminster Abbey next. Serious injury by fire is now unpardonable. The May-Oatway Fire Alarm insures discovery in time to prevent loss or fatal consequences. It detects the fire, calls the nearest Fire Brigade, and all helpers, and points out the seat, extent, and course of the fire automatically, whether the building is occupied or not. Architects and builders invited to inspect.

SIR EYRE M. SHAW (late London Fire Brigade), Chairman.

SIR W. H. PREECE, Consulting Electrical Engineer.

VOLUME LXV. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered, price, 12s.
Imperial Buildings, Ludgate Circus, E.C.

BUILDING AND BUILDERS.

THE Archbishop of Dublin has laid the foundation-stone of St. Catherine's National Schools, which are to be erected at Donore Avenue, South Circular Road, Dublin.

FOUNDATION-STONES of cottage homes and schools for the children of the Medway Union have been laid at Chatham. The buildings will cost between 25,000*l.* and 30,000*l.*

THE foundation-stones of a new Primitive Methodist Sunday school in the Linthorpe district, Middlesbrough, were laid on the 23rd ult.

At a special meeting of the Oswestry Town Council on the 28th ult. the resignation of Mr. J. Perry Jones, the town clerk, was accepted, and Mr. S. Pryce Parry, solicitor, of Oswestry, was elected to fill the vacancy. On November 9 the Town Council will elect their late town clerk to the mayoral chair. It is understood that the mayoralty of Welshpool is to be offered to the Earl of Powis.

THOMAS WRIGHT, 342 Bristol Road, Birmingham, was summoned on the 25th ult. for not complying with the by-laws. Mr. Nadin stated that the offence was that defendant failed within a reasonable time after the completion of a building in Moor Street to send a written notice to the surveyor of the completion of the erection of such building. Fined 20*s.* and costs, and a similar amount for occupying the premises.

THE Bradford City Council confirmed, on the 29th ult., a resolution passed by the health committee accepting the offer of Mr. Douglas, on behalf of Jowett's trustees, to sell to the Corporation 25,142 square yards of land at Faxfleet Street, Manchester Road, at 3*s.* 6*d.* per yard, for the erection of dwellings to accommodate persons intended to be displaced from the Longlands district. A plan prepared by the city architect making provision for the erection of 114 houses was also adopted.

THE foundation-stone of the new nave of Awsworth parish church was laid on the 19th ult. The ceremony marked the commencement of another stage in the active work of church extension and rebuilding carried out during the ten years' incumbency of the present vicar, the Rev. Vincent J. Higgins. The proposed church is to be of red sandstone brick, with dressings of Coxbench stone. The seating accommodation will be for 600 persons—about double the accommodation of the former structure—and though the new edifice will not be

of much architectural pretension, it will possess an appearance of neatness and dignity in keeping with the sanctity of its purpose. The eastern portion of the old nave is being retained, and will be adapted as the chancel of the new church. The architects are Messrs. Naylor & Sale, of Derby, and the general contractors Messrs. Walker & Slater, of Derby. The cost of rebuilding is estimated at 1,800*l.*

THE foundation-stone of the new masonic temple to be erected in Bathgate was laid on Saturday. The present hall is being built on the site of the hall used by the Hopetoun Lodge, now dormant, that property having been acquired for the purpose. The new building is being constructed from plans by Mr. Peter L. Henderson, architect, Edinburgh, and is two storeys in height, having club premises and a caretaker's house on the ground floor and the hall or lodge-room on the upper floor, which is approached by a wide and open staircase, lighted by a large window in the back wall, and consists of a hall 37 feet long by 21 feet broad, and suitable retiring-rooms and lavatories. The hall is lighted by a row of five windows to Jarvie Street, the centre one being an oriel window projecting over the entrance doorway, and supported by the key-stone of same. Externally these windows are separated by carved Ionic columns, after the German Renaissance style of architecture. The entrance doorway is very massive, with deeply moulded jambs and archivolt, the latter broken by moulded rusticated voussoirs and keystone.

ELECTRIC NOTES.

At a meeting of the Bootle electric-lighting committee Mr. T. D. Clothier, of Hull, was appointed borough electrical engineer at a starting salary of 350*l.*, in succession to Mr. W. R. Wright, who has received a high appointment at Wellington, New Zealand.

ELECTRICAL appliances in use in the United States to-day are estimated to be worth 3,975,000,000 dols. The capital of the Magnetic Telegraph Company, the first to introduce the use of electricity for industrial purposes (in 1846), was 15,000 dols. Electrical industries have bounded forward at the rate of 53 per cent advance annually for fifty-four years, until to-day 600,000 persons in the country earn a living in the various lines of electrical business.

THE health committee of the Birmingham City Council have, in conjunction with the Drainage Board, a project on hand for the construction of a new refuse destructor on part of the sewage farm near Saltley, which shall also become a station for the generation of electricity to be used for the lighting of the various buildings and offices connected with the Drainage Board at Tyburn. Under the Parliamentary Bill which is to be promoted next session, the health committee are inserting a clause to enable them to acquire from the Drainage Board the necessary site.

VARIETIES.

A NEW church at Blackridge, in Linlithgowshire, was opened on Friday last.

A NEW Wesleyan chapel, which has just been completed in Darlington Street, Wolverhampton, has been opened.

A BEAUTIFUL east window, which has been placed in Cumnor Church, near Oxford, in memory of Sir William Wilson Hunter, K.C.S.I., was unveiled on Saturday morning in the presence of a large congregation.

ON Saturday last the Bishop of Ripon reopened the ancient and beautiful church at Methley, which has been thoroughly renovated at a cost of 3,000. A new heating apparatus has been fixed, and the incandescent gaslight introduced.

THE President of the Board of Education has appointed Professor Hugh L. Callendar, F.R.S., to the Professorship of Physics in the Royal College of Science, vacant by the resignation of Professor Rücker, who has become Principal of the University of London.

THE new Volunteer drill hall, Bilston (Staffs), was opened on Friday afternoon by the Earl of Dartmouth in the presence of a large assemblage. The site for the building was given by Sir A. Hickman, M.P. The plans were prepared by Mr. H. T. Hare, London, and the work has been carried out by Mr. T. Tildesley, Willenhall.

A NEW steeple has just been added to the parish church, Fooks Cray, Kent. It has been dedicated by the Dean of Norwich "To the glory of God and in commemoration of Her late Most Gracious Majesty Queen Victoria." As long ago as 1700 the steeple of the church was condemned as unsafe, but it was still standing when the present rector, the Rev. C. Birch,

entered upon his charge in 1861. It was then stayed and strengthened, and so made to serve for another forty years. But within the past few months the condition of the structure had become so dangerous that it was found absolutely necessary to demolish it and erect a new one. The old Kentish timber and shingle style of steeple which has been associated with the church for hundreds of years has been reproduced. Advantage was also taken of the occasion to have the peal of five bells retuned by Messrs. Gillett & Johnson, of Croydon, and rehung in the steeple. The work has cost altogether 6000.

LYNG parish church, Norfolk, has been reopened for public worship, after restoration. The south wall has been taken down and rebuilt. While this work was in progress, the stones forming a former chancel arch were discovered embedded in the wall. These, with a few new stones, have been utilised in building the new arch. New buttresses have been erected with Weldon stone quoins and flint facings, the gable end rebuilt and surmounted by a cross. The new roof is of open-timbered pitch-pine, with hammer-beams, covered with felt and permanent green slates, with Broseley ridge tiles. The south windows have been reglazed with cathedral glass, the chancel floor relaid with Minton tiles, and the reading desk moved to a more convenient place in the chancel. The small galleries at the west end have also been removed. The architect was Mr. A. J. Lacey, of Norwich, and the contractors Messrs. Springall & Sons, of Swanton Morley. The total cost has been upwards of 7000.

THE members of the Midland District of the Incorporated Association of Municipal and County Engineers held a meeting at Nuneaton on the 12th ult., about 150 members being present. They were officially received by Mr. T. Horton, C.C. (vice-chairman of the Nuneaton and Chilvers Coton Urban District Council, with whom were most of the members of that body, and the usual meeting was held, with Mr. E. George Mawbey, M.I.C.E. (president), in the chair. A paper on "Municipal Work in Nuneaton" was read by Mr. J. S. Pickering (hon. district secretary, and surveyor and engineer to the Nuneaton Council), a discussion following, amongst those who took part therein being the chairman, Dr. Bostock Hill (Birmingham), Messrs R. C. W. Berrington (president of the Birmingham Association of Students of Civil Engineering), Price (Birmingham), Dawson (Banbury), Lockley (Hanley), Eyres (Birmingham), Smith (Kettering), Watson (Birmingham), Lacey (Oswestry), Griffiths, Lowcock, &c. Afterwards the party visited the brick and tile-works of Messrs

tanley Brothers at Stockingford, where they were entertained to luncheon. They also visited the Council's sewage and electricity works.

THE opening meeting of the Auctioneers' Institute (session 1901-2) took place on Wednesday evening in the Examination Hall, Savoy Street, Strand. There was a large assemblage of members under the presidency of Mr. W. Bennett Rogers, who in his inaugural address congratulated the members on the progress of the Institute. The benevolent fund now, he said, amounted to 1,250/. Their examinations were proceeding, he was glad to say, upon solid lines, and were showing hopeful results. The number of entries had increased to the extent of over 100 per cent., and the percentage of passes was now 84 per cent. These facts were eminently satisfactory. All the prizes offered by the Institute had been won this year, and the gold medal had been awarded for the first time.

TRADE NOTES.

THE new Co-operative Stores, &c., at Dartford, have lately been fitted with improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool.

THE directors of the London and Lancashire Fire Insurance Company have declared an interim dividend of 4s. per share (being at the same rate as the last interim dividend), payable on November 8, 1901.

THE Isolation Hospital, Skipton, is being warmed and ventilated by Messrs. E. H. Shorland & Brother, of Manchester, by means of Shorland's patent Manchester stoves, some double-fronted and some single-fronted, with descending smoke flues.

MESSRS. BOYES & CO., LTD., of Scarborough, have had a large illuminated turret clock, showing the time upon four external dials, with all the latest improvements, Lord Grimthorpe's double three-legged gravity escapement and compensation pendulum, &c., fixed at their new warehouse. The work was executed by Messrs. Wm. Potts & Sons, clock manufacturers, Guildford Street, Leeds, and Newcastle-on-Tyne.

THE ancient quarries of Verde Antico in Thessaly (discovered by Mr. Brindley), from which the whole of this choice green marble was obtained for the beautifying of Rome and Constantinople, are now in full work, and the marble, being drawn directly from the solid rock, is free from shakes. Messrs.

Farmer & Brindley have just received the largest consignment of blocks quarried since the building of Sta Sofia, Constantinople. Twenty of these of choice quality may be seen at their depôt, Westminster Bridge Road, most of them being nearly 14 feet in length. One block alone is large enough, if cut into wall slab, to cover 1,250 feet of surface, the whole of it uniform in colour.

NEW CATALOGUES.

THE British Power, Traction and Lighting Co., Ltd., of York have sent us their new illustrated price list of water and air heaters, which they manufacture in considerable variety, adapted to numerous purposes. Conspicuous among these for its utility is their Paul's patent P.T.L. exhaust steam feed water heaters, of which they manufacture several types designed to utilise the exhaust steam from non-condensing engines (usually blown into the atmosphere and lost) for heating the feed water of steam boilers, and their adoption for this purpose has, it is claimed, in most cases resulted in very appreciable reductions in coal consumption, varying from 15 per cent. to 25 per cent., which is equivalent to an annual saving which would probably more than cover the original outlay. Among other types illustrated is Paul's patent waste steam economiser, a useful apparatus for producing large volumes of hot water by the utilisation of exhaust steam, and thereby avoiding recourse to the employment of live steam.

ANOTHER price list has reached us from Messrs. Smithson, Sharpe & Co., electrical and mechanical engineers, Chase Street, Red Bank, Manchester, the principal novelty in which is perhaps their inverted differential arc lamp, which is identical with the vertical lamps both in price and also in construction, with the following exceptions:—(1) The carbons are inverted, *i.e.* the large (positive) carbon is placed at the bottom and the small (negative) carbon is placed at the top; (2) a metal reflector is substituted for the ordinary globe. This lamp, which is made for both direct and alternating currents, will be found of great utility where a good diffused light is required, and one which gives no shadows, and is especially suitable in places such as weaving sheds, where fine threads have to be joined up, and in large offices and warerooms with nice white ceilings. By means of the inverted lamp the rays of light are thrown up by the large reflector on to the ceiling, and are thence diffused and thrown down equally all round.

TUBULAR VENTILATING STANDARDS.

ONE of the reasons for the indifference to sanitary appliances is the unsatisfactory appearance of so many of them, although they may be efficient as aids against danger. The ventilating shafts especially are disagreeable to look on. Sanitarians will therefore at a glance perceive the advantages of the new Tubular Ventilating Standards, which are manufactured by Mr. Joseph Aird, of the Wellington Tube Works, Great Bridge, Staffordshire. They are not only graceful in appearance, but as they are constructed of tough materials they can resist wind power and atmospheric influences. The upper portion consists of Mr. Aird's specialty, viz wrought-iron or mild steel tubing. As the standard can be built up of sections, it will be evident there is more economy than is found when one section is continuous. By the arrangement the standard can be built up to whatever height is desired, and the junctions of the tubes are covered with ornamental rings which enhance the effect. The base is of cast-iron and is of graceful form, and beneath the casting has a connecting branch for junction with the sewer.

We understand that large quantities of the Tubular Ventilating Standards have been supplied to local boards, urban district councils and other authorities. The standards are no less well adapted for use as telephone or telegraph posts without any diminution of their efficiency as ventilators. Mr. Aird's latest adaptation of his well-known tubes has met a sanitary requirement which engineers and others have long desired.

STEAM TURBINES.

By F. J. WARDEN-STEVENS, A.M.I.M.E., A.M.I.E.E.

THE steam turbine is the outcome of many attempts to devise a practical steam-engine producing direct rotary motion. Such attempts may be said to date from the time of Hero, who it is generally admitted was the first to invent a machine to utilise the power of steam.

Inventors in this direction have endeavoured to dispense with the transformation of the ordinary reciprocating motion of the steam piston to a rotary motion, which is mostly acquired by means of the crank shaft. The chief difficulty with attempts to devise practical rotary steam-engines has been to make the moving parts steam-tight. The forms which these

inventions have taken are numerous, but the only present-day forms which are really practical machines are steam turbines which act either by the expansive effect of the steam, or by the velocity and weight of the steam, in a manner similar to the two classes of water turbines, the reaction and impulse types respectively. It is to the latter type of steam turbine I propose to refer herein, the former having received full attention by several writers.

No. 6412. DE LAVAL PATENT STEAM TURBINE M.
Type M.M.T. 225 B.H.P.

No. 6395. 100 B.H.P. TURBINE DYNAMO. TYPE I

No. 6414. DE LAVAL PATENT STEAM TURBINE PUM.
5 B.H.P. TYPE B.P.

The De Laval steam turbine originates from Sweden and is due to the careful investigations of an engineer whose name it bears. This turbine practically consists of a wheel carrying vanes or buckets on its periphery, somewhat similar to a Pelton water-wheel. This wheel revolves in a steam case through which pass nozzles in a radial form. Steam of high pressure is admitted through these nozzles and expands; then, all its energy being converted into kinetic energy of energy of motion; it then acts against the buckets of the v

The steam is allowed to reach its limit of expansion before it reaches the buckets by means of the internal form of the nozzles; thus the steam when it comes into contact with the

6415. DE LAVAL PATENT STEAM TURBINE MOTOR ON STAND.
5 B.H.P. TYPE B.T.S.

buckets has a considerable increased velocity over and above that when it leaves the boiler. It can thus be seen that the De Laval steam turbine is a high-speed engine, as it is necessary to insure efficiency that the velocity of the steam be great, therefore the periphery of the wheel must revolve at a high

velocity. The constructive design of this turbine has been most carefully worked out to insure sufficiency of strength, in view of the high speed, without unnecessary weight of material.

One of the chief points in the construction of this turbine is the flexible shaft, the bearings of which are placed at a distance from the revolving wheel to allow of slight displacement of the same, enabling it to obtain its proper line of rotation, and thus obviate the hammer action of the shaft upon the bearings. As the speed increases the vibrations of the shaft increase, and it is found that the shaft vibrates and the line of rotation approaches the centre of gravity after a certain normal speed, when the vibrations cease. The reduction of speed is effected by special machine-cut helical gear, and the control of speed by a very sensitive form of centrifugal governor, acting through a lever motion to a balanced valve.

A further special feature of this turbine is the arrangement for altering the power; this can be effected without adjustment of the stop-valve, as with an ordinary steam-engine, by means of stoppers (or valves) on the several nozzles, which may be closed or opened as desired.

The steam turbine is essentially a machine producing power without vibration, and therefore requiring practically no foundation. It occupies small space and is comparatively noiseless; it is also efficient and inexpensive. For small power purposes the steam turbine has many advantages, and it may be obtained as small as 3 horse-power or as large as 300 horse-power.

Amongst the many uses for which it is adapted are direct coupling to centrifugal pumps, fans or blowers and dynamos.

As giving some particulars regarding the efficiency of these steam turbines direct coupled to dynamos, the following test made on two sets of plant may be of interest. These machines were manufactured for the Poplar Guardians to the requirements of the writer, acting as consulting engineer.

Speed of turbine 22,000 revolutions per minute.

Speed of dynamo 2,200 revolutions per minute.

Output, 20 kilowatts.

The steam consumptions were as follows:—

Load.	Condensing.		Non-Condensing.
Full	•	Vacuum 25 Inches. 38 lbs. per unit	61 lbs. per unit.
$\frac{3}{4}$ load	•	37.6 lbs. per unit	59.5 lbs. per unit.
$\frac{1}{2}$ load	•	40.5 lbs. per unit	84 lbs. per unit.

Taking the efficiency of the dynamos at 90 per cent., these

results are equivalent to about 25 lbs. of steam per brake horse-power working condensing at any load down to half load. This is certainly as good a result as any obtained in practice with ordinary engines, the remarkable feature being the sustained economy at low loads.

Very good reports of the reliability and durability of these turbines are available, practically the only wearing parts being the bearings and the gearing, but even with regard to these a case might be mentioned of a 100 horse-power steam turbine working in a mill not requiring any renewal of these parts after two years' continuous running day and night.

Several thousand horse-power of these turbines are in use, so that their adoption does not involve the risk of experiment; it is, however, only comparatively recently that they have been introduced into this country, and I think it speaks well for their future here to know that their manufacture has been undertaken at Leeds by the well known engineers, Greenwood & Batley, Limited.

Amongst those in this country who have already adopted this form of steam motor may be mentioned:—Messrs. J. Bartram & Son, London and Melbourne; Messrs. S. Williams & Sons, Ltd., Dagenham, Essex; Messrs. Humphreys & Glasgow, London; Messrs. Lister & Co., Manningham Mills, Bradford; the Colne Corporation; Messrs. A. G. Enock & Co., London; the Poplar Union, London, and the Nelson Corporation.

Its existence, if not its qualities, are known to most engineers in this country, but the writer feels that the De Laval steam turbines are capable of being of service in other directions than amongst engineers, and it is his endeavour to direct the attention of architects, builders and contractors to its special uses with which they are connected. Foundations for steam-engines are without doubt in many cases of considerable concern to them, whether in relation to pumping, ventilation, machine driving or electric lighting, and whether for temporary or permanent works, and a steam motor necessitating only slight, if any, foundation is in many cases of great advantage. Further, durable, reliable and at the same time inexpensive plant requiring small space is not always or generally obtainable. As giving an idea of the size and weight of these steam motors, it might be mentioned that one of 10 horse-power weighs 5 cwt., and occupies a space of 3 feet 1 inch by 1 foot 8 inches by 2 feet 11½ inches, and one of 50 horse-power weighs 29 cwt., being 5 feet 8 inches by 3 feet 1 inch by 4 feet 1 inch.

For pumping, advantages are gained by increase of the

speed of centrifugal pumps, and the arrangement of coupling two pumps to one turbine shaft. Thus, by connecting pumps in series a greater pressure can be obtained than by one large pump, or by connecting the pumps in parallel double the quantity may be dealt with at a lower pressure as may be desired.

As showing the steam consumption of various sizes of these turbines, it may be mentioned that one of 20 horse-power working at a steam pressure of 90 lbs. per square inch requires 45.5 lbs. of steam per brake horse-power working non-condensing. This is decreased to 25.4 lbs. working condensing; by increasing the pressure of steam to 120 lbs. per square inch the steam consumption is reduced to 41.8 lbs. from 45.5 lbs. working non-condensing, and to 24.4 lbs. from 25.4 lbs. working condensing.

The speed of the turbine wheel of a 5 horse-power machine is 30,000 revolutions per minute, and of a 100 horse-power machine 13,000, the reduction gear being usually 10 to 1.

The result of test of a 50 horse-power "Duplex" steam turbine pump coupled in parallel gave a delivery 32.8 feet, the output being 3,810 gallons per minute; the efficiency of the plant was thus 75.39 per cent.

Builders and contractors should find these turbine pump of great use in connection with excavating, as they may be erected almost anywhere, and, further, the advantages of working condensing can always be easily obtained by means of, say, 20 feet of water. A small portion of the water pumped can be returned to the sump through the condenser, all the advantages of condensing being obtained without an expense or trouble.

CORDWAINERS' HALL, CANNON STREET.

THE hall of the Cordwainers' Company, one of the most ancient of the City Guilds (the Cordwainers being named from the trade in Cordovan leather, which was manufactured in Cordova in Spain), which is situated on the north side of Cannon Street, has during the last few months had extensive decorative work executed to it. The internal decorations of the large hall of the first floor, and the lower hall and court-room on the ground floor, were originally executed in the Adams style, but beyond simple friezes the walls and ceilings were left with plain surfaces. The Court have long felt that rooms of such proportions required more decoration to complete them, and

during the recent vacation they have had the lower hall and the court-room ceilings decorated with Adams's plasterwork, and have had a selected series of oval medallions fixed to the walls, thus breaking up their bareness underneath the enriched frieze which already existed. An Adams dado has been fixed in enriched material round the two rooms, and the whole of the rooms have been decorated throughout in a rich buff colour, relieved and picked out with gold. Both the new ceilings have also been gilded in their enriched portions, and care has been taken that the rooms shall be effective, not only in daylight, but in artificial light, under which they are largely used. The ceilings have been supplied and fixed by Messrs. Jackson & Sons, of Rathbone Place, the painting and gilding works being executed by Messrs. Colls & Sons, of Coleman Street. The whole of the works were designed and have been carried out under the personal direction of Mr. Howard Chatfeild Clarke, of Bishopsgate Street Within, the Company's surveyor.

RUBEROID ROOFING.

SEEING that roofs are such an important factor in perfecting buildings, it is necessary for those who have anything to do with their construction to find a suitable material for a covering. Many roofings have of late years been brought on the market to meet the requirements of the users, but some are of very doubtful qualities, as they have to be frequently tarred to keep them from rotting, consequently such materials become more expensive in the end than slates, &c. To obviate all these difficulties a roofing called the Ruberoid roofing has been in general use for some years, and wherever employed as a covering has given entire satisfaction. It is not far to seek for the cause of the success of this material, inasmuch as it is a roofing suitable for all climates and atmospheres, being light and very durable, waterproof and odourless, acid and alkali proof, easy to lay, and needs neither painting nor coating, and, above all, vermin will not attack it.

To show its non-conductive qualities, we give the following temperature test made by the Marshall's Paddington Brewery, Oxford Street, Sydney, against their roof of galvanised iron:—

Jan. 29.—Noon. Hot day. Ruberoid 86°. Iron 112°.
Feb. 3.—11.30. Hot and bright. Ruberoid 90°. Iron 105°.
Feb. 4.—11.30. No sun. Ruberoid 75°. Iron 78°.
Feb. 5.—11.30. Hot day. Ruberoid 84°. Iron 108°.

It will be seen from this that where an even temperature is required Ruberoid should be used in place of iron.

It would take too much space to name all the buildings in the various countries covered with Ruberoid roofing, but to prove the high estimation in which Ruberoid is held by Government officials and others, we are told that the German barracks in China was covered with it, as also was the annexe building at the Government House, Sydney; and Mr. Baldwin, of the Baldwin-Ziegler Polar Expedition, knowing that it resisted the cold as well as heat, took with him to the North Pole 30,000 square feet. The material will be used for housing the forty men, the hundreds of dogs and other animals, and the ship itself. In Java the Ruberoid is used extensively for sugar factories and the awning of ships during the great heat. In America it has been used for railway stations and buildings of all kinds. Coming nearer home, Ruberoid has been employed on buildings of large estates, gunpowder works, engine sheds, &c., and the entire buildings of Messrs. George F. Milnes & Co., Ltd., new car-building works at Hadley, Salop, have been covered with this material, as also the Electrolytic Alkali Company's works at Middlewich, Cheshire. The latter are extending their works and are so satisfied with the roofing that they are covering the new buildings with it as well. We learn that the gold medal has been awarded Ruberoid against all competitors at the Pan-American Exposition at Buffalo, U.S.A.

We think sufficient has been said to show that Ruberoid is a valuable roofing material, and the sceptical only want to give it a trial to test its efficacy.

SINCE the conference of delegates of local authorities in Worcestershire the executive committee appointed have been taking into consideration sites and plans for an establishment in Worcestershire for the open-air treatment of consumption. One plan submitted to the committee would provide forty-eight beds at an estimated cost of 10,000l. A smaller alternative scheme would provide twenty beds at an estimated cost of 5,000l. The executive are appointing local committees throughout the county to invite subscriptions. An ideal site for such an institution, at Romsley, near Clent, has been offered on generous terms by Lord Cobham, who is taking keen interest in the movement.

MUNICIPAL FIRE INSURANCE.

A PETITION from the members of the fire protection committee of the wards of Cripplegate Within and Without is in preparation for presentation to the City Corporation in favour of a scheme of municipal fire insurance. They complain that they have not been fairly treated by the fire offices, which, after the great conflagration in Cripplegate in November 1897, imposed an exceedingly heavy "block" rate of insurance, it being understood by the petitioners that the largely increased rate was only of a temporary character, and that it would be removed when the tariff offices had recouped themselves to some extent for the losses they sustained through that disastrous fire. The fire protection committee have presented a memorial to the fire offices committee asking for a reduction in the high premiums at present demanded, and pointing out that the area covered by Cripplegate Within and Without cannot now be regarded as specially hazardous, as the means of fire prevention and extinction have been largely increased, while in the new buildings which have been erected in the place of those destroyed stone staircases have replaced wooden ones, skylights have been largely eliminated, and means have been taken for enabling firemen to operate from the roofs of the buildings. The answer returned to the petitioners was an unsatisfactory one, they being informed that in the opinion of the fire insurance offices the area was still a dangerous one so far as risks from fire are concerned, and also that the improvements that had been made in warehouses were individual in character. Regret was expressed that the proper authorities did not seize the advantage afforded after the great fire in Cripplegate four years ago of widening the streets of the area and effecting other improvements. The petitioners will ask the City Corporation to consider a scheme of municipal fire insurance in order that the great disadvantages under which inhabitants of the area suffer owing to the greatly increased fire premiums may be removed.

SAFETY OF THEATRES.

ON Wednesday, October 30, a meeting of the O. P. Club was held in the Victoria hall of the Criterion Restaurant in order to hear a paper by Mr. Edwin O. Sachs, entitled "The London County Council and Theatre Safety." It was admitted in the paper that as far as the primary essentials of such protection

were concerned, the world's experts were by no means agreed. There was no uniformity in legislation for theatre safety, not even in its elementary principles.

Mr. Sachs held that clear planning in a theatre was of greater importance to the audience than clever fire-resisting construction, and the regular attendance of reliable fire-watches day and night, and especially during the performances, was more essential than any amount of surprise inspection. He considered the order of precedence for theatre safety to be:—(1) Straightforward planning; (2) regular watching; (3) skilled inspection; (4) good construction. The protection of life by means of rapid exit should always have the first place.

In conclusion Mr. Sachs tendered the proposal that the Lord Chamberlain, who had always enjoyed so much confidence, should appoint a special commission, which, after due personal inspection of existing theatres, both at home and abroad, and due examination of the rules and regulations in Great Britain, in the colonies, and in foreign countries, should draft some practical scheme by which the essentials of theatre safety might be obtained, and some practical scheme for control and administration be formulated. Given this investigation on thoroughly practical lines, it would rest with the Lord Chamberlain or the Government to recommend such changes in the existing state of affairs as might be necessary. Such an independent commission should comprise at least an architect, a surveyor, an engineer, a fire expert, a lawyer, a business man, a theatre manager and an actor. Such commissions had been created, both in the United States and on the Continent, after great theatre catastrophes, and had done excellent work.

A DISCUSSION arose at last week's meeting of the Cardiff public works committee over a notice of motion given by Councillor S. O. Williams, who proposed that West Bute Street, Docks, should be paved with wood blocks. It was agreed that Mr. Harpur (borough engineer) should submit an estimate of the cost of laying down several kinds of pavement. The Chairman explained that the Council had once decided against the need of carrying-out such expensive work in this street. Mr. Harpur said that on the initiative of Alderman Sir Thomas Morel he had prepared an estimate a few months ago, and that the total cost then worked out at 2,920*l.*, including the cost of substituting the present footway, a work which would be necessary if the road was to be wood-blocked.

THE WEEK.

It was fitting that a memorial of the late Sir JOSEPH W. BAZALGETTE should be set up on a pedestal of the Thames Embankment, which was one of the colossal works he executed whilst holding office as engineer to the Metropolitan Board of Works. The majority of people who use the roadway along the river are not aware of the impediments which had to be overcome before a region of mud could be superseded. For many years various projects were brought forward for embanking the Thames, and among the men who prepared them were Sir CHRISTOPHER WREN and JOHN MARTIN, the painter of scenes of imaginative architecture. But the expense and the trouble always daunted those whose approval was necessary. BAZALGETTE was of foreign extraction, and like his contemporary, the younger BRUNEL, he was endowed with more imagination than the majority of English engineers. In mind, as in body, he was lithe and active, and when he had resolved upon an undertaking he was indifferent to opposition. On his acceptance of the appointment of Metropolitan Engineer it was expected by his friends that as he would have to encounter the worst class of vestrymen he was certain to send in his resignation after a very brief tenure of office. But he realised there were great works before him, and instead of a servant he became the master of the Board. He was sure of the support of the chairman of the Board, JOHN THWAITES, an honourable and devoted man, whose statue should also be set up on the Embankment, and to the opposition of the rest of the members BAZALGETTE was indifferent. He was an excellent witness in Parliamentary committee-rooms, and he was fortunate in obtaining more attention for his schemes from Lords and Commons than was usual at an earlier time. Once an effort was made to charge him with showing favour to a particular contractor, but on inquiry it was found that instead of supporting the supposed favourite he had advised the Board against accepting his tender. His main drainage of London and Thames Embankment should be enough to keep up his reputation. But the committee of friends, consisting mainly of engineers, were acting rightly in contributing towards the expense of a memorial to a man who was a credit to English civil engineering.

On February 25, 1897, a contract was entered into between the Roedean School Site and Buildings, Ltd., and Messrs. PETERS & SON for the erection of a school at Brighton, the amount being 48,589*l.* Mr. J. W. SIMPSON was the architect. It was provided by Clause 4 of the contract deed that the works must be completed to the architect's satisfaction on or before September 1, 1898, provision being made for penalties for delay. Clause 16 provided for the payment of the contract price by instalments upon the architect's certificate, and provision was also made for the determination of the contract in the case of the bankruptcy of the contractors, &c. Clause 26 provided for a full reference of all disputes and matters which might arise between the building owners and the builders to the architect, Mr. SIMPSON. On September 1, 1898, the buildings were very far from completion, and the builders were obliged to obtain loans from a Mr. BELCHER and other people on the credit of the contract. Notice was given of these advances, and the lenders got a charge on the contract. On January 27, 1899, the architect gave the contractors notice to proceed with the work under the twentieth clause of the contract, and on their failure to proceed according to his satisfaction on February 1, 1899, the building owners served notice to determine the contract. On the same day a petition in bankruptcy was presented by the contractors, which was followed by a receiving order. Then the work was taken over in accordance with the terms of the contract by the building owners, and completed under the inspection of the architect. On June 27, 1901, the architect issued his final certificate, which showed a balance due to the contractors

above the amounts paid to them of 350*l.* 18*s.* 5*d.* This was sent to the trustee in bankruptcy of the contractors, accompanied by a statement of accounts by the Roedean School Site and Buildings, Ltd., in which they showed that in consequence of the non-completion of the works in accordance with the contract, there was a balance due to the company of 1,255*l.* 7*s.* 5*d.*, after deducting the 350*l.* 18*s.* 5*d.* due to the contractors on the architect's final certificate. On July 6, 1901, the solicitors to the company wrote to Mr. SIMPSON, asking him to make an appointment as arbitrator under the contract, but both Mr. BELCHER and the trustee refused to acquiesce in the reference to Mr. SIMPSON. On July 23 the arbitrator held a sitting, but as only the company appeared he adjourned it. On the same day Mr. BELCHER issued a writ against Mr. SIMPSON, the architect, claiming damages for misrepresentation on the ground that Mr. SIMPSON had given him wrong information when he (Mr. BELCHER) called upon him in order to see if he might safely advance money to the contractors. A summons was then taken out before the Judge for an injunction to prevent the arbitration proceeding, and this was granted, and at the same time the submission to arbitration of the architect was revoked by Mr. Justice LAWRENCE. It was contended by counsel that the action against Mr. SIMPSON was brought for the purpose of bringing the case within the decision of *BARING v. DOULTON & Co.*, and so preventing the architect from acting as arbitrator. Accordingly an application was made on Monday last in the Court of Appeal by the Roedean Company. After hearing the arguments on both sides, their lordships came to the conclusion that there was no ground for removing the architect from his position as arbitrator, and reinstated him in his position. The appeal was accordingly allowed, with costs. The judgment is most important in establishing the position of the architect as arbitrator. The case was complicated by the action of other parties, and, indeed, the apparent cause of the decision of Mr. Justice LAWRENCE was the circumstance that there was litigation between the architect and one of them.

THE river Wansbeck nearly surrounds the town of Morpeth, and it is to be assumed that a bridge must have been erected there at an early date. TELFORD constructed one of three arches, which is an excellent work, and its success may have helped to make people indifferent to the history of the earlier bridges. During the works for the intercepting sewers which are now in progress masonry has been encountered which is assumed to be a part of the foundation of one of the ancient abutments. The work is of excellent construction, and it was pierced with difficulty. Morpeth obtained a charter for a fair and market from King JOHN in 1199, but a few years afterwards he destroyed the town. The church is believed to be a work of the fourteenth century. It is therefore possible that about the same date a bridge may have been constructed, although apparently there is no record of its existence except the abutment we have mentioned.

THE committee of the Commons and Footpaths Preservation Society are endeavouring to obtain the removal of the barbed wire and other enclosures which were recently set up around Stonehenge, and with that object legal advice has been obtained. Several clearly-defined tracks leading to the monument have been obstructed by the erection of a barbed wire fence, and the Society were advised that *prima facie* there is a strong case for the existence of public rights of way over these tracks. The committee have resolved to petition the local authorities to protect the public rights involved. Letters from eminent archaeologists have been received protesting against the enclosure of Stonehenge, on the ground that the character of the monument has been entirely altered by the wire fence. It is further pointed out that the stones could be amply protected from injury without enclosure by means of the Ancient Monument Protection Acts. There are several other places where public rights have been ignored, and at the present time no less than 150 cases are under the consideration of the committee.

UGLINESS IN ART.

WHEN we find there were esoteric doctrines among the Greeks, we are permitted to conclude they were not altogether unknown to the artists. If so, there is less difficulty in understanding why some forms which could not be described as beautiful were adopted for representation. We are puzzled to account for the existence of a deformed being like VULCAN among the principal deities of Olympus, but we can suppose there was an explanation which was known to some initiated persons, and which was more plausible than the statement that the son of ZEUS and HERA was born a cripple, or was lamed by his fall from high Olympus to the island of Lemnos. Deformity or ugliness possibly had a meaning in ancient Greece which has not come down to us. The Minotaur was another subject which seemed to be beyond the range of art, and the philosophers in Athens possibly never accepted it as a mere legend about the son of MINOS and of PASIPHAË. What can be uglier than the earliest representations of the MEDUSA, such as that seen in one of the metopes of the Selinuntine Temple? For it took a long period before the sculptors ventured on the pathetic beauty we see in the Ronandini head of the Gorgon. There were other forms which also prove to us that with the Greeks there was a use found for ugly and horrible creatures in their works of art.

It cannot be true, as some writers maintain, that ugliness was only employed for the sake of contrast in order to heighten the beauty of other parts of the same composition. Examples of single figures as well as large works are proofs that the thoughts of the artists were occasionally concentrated on ugly rather than on more pleasing forms. The Greeks in such cases may have derived their inspiration from foreign works, and it must be acknowledged that ugliness seemed to be entirely out of keeping with the Greek spirit. But whatever were the sources, ugliness was utilised in literature as well as art, and we have no means of knowing for what reason. Although PLATO has much to say upon beauty, it is remarkable that he is silent about its negation or the peculiarities of ugliness as an independent quality.

The old tradition of the contests between ORMUZD and AHRIMAN, or the spirits of good and evil, light and darkness, would be enough to explain much of the ugliness which is to be seen in Eastern works. When Christianity began to illuminate the earth, and to keep believers as a race apart, there were still stronger reasons to make it appear that whatever was bad was essentially ugly. In Mediæval philosophy it was accepted, according to the biblical statement, that all that was made was good, and there was no place in the world as it was created for any being that was not beautiful. The beautiful and the good were assumed to be identical. But while such doctrines were taught in the cloisters and monastic schools, the designers of cathedrals and churches, who for a long time were monks, did not hesitate to introduce figures in parts of the buildings which to ordinary eyes were hideous. They were intended to represent demons, heretics and excommunicated sinners; and they opened a field, as it were, for the creation and employment of ugliness which was of much larger extent than in any preceding age. The devil and his angels for centuries were depicted and modelled as beings whose appearance was enough to defeat any attempts at the temptation of men. Indeed, it was not until GOETHE made the experiment that the world was able to suppose that MEPHISTOPHELES, or the arch-deceiver, could assume the form of an experienced man of the world. But even in his great poem a concession had to be made to Mediæval prejudices, and some of the characters have an instinctive fear of the being to whom the venerable FAUST had subjected himself.

Everything that GOETHE did or said gave rise to controversy, and his adoption of a legend in which the Tempter, who heretofore was regarded as the most debased of all forms of ugliness, stood forth as if he bore resemblance to mankind, was the cause of much cavilling. The subject of ugliness in art was discussed as it had never been in a more philosophic age, and one of the SCHLEGELS insisted that ugliness had laws which deserved consideration. Various other writers of the time took up the subject and treated it with

true German exhaustiveness. It was not long before treatises appeared on the æsthetics of the ugly.

It is a remarkable fact that theories which arise in Germany, and which are imprisoned in the pages of books, are acted upon in France regardless of all risks. The realisation of volumes of conclusions about the importance of ugliness in respect of art will be found in the works of VICTOR HUGO and of numerous writers who followed him down to our time. When VICTOR HUGO introduced such characters as appear in "Notre-Dame," "Lucretia Borgia," "Angelo," "Le Roi s'amuse," he was paying tribute to German psychologists, and was expanding their theories throughout the world with a force which was unknown to the originators. The Romantic School was founded, and it became unquestionable that one of its aims was to have consideration given to physical and moral ugliness or monstrosities in many forms. HUGO afterwards was subjected to sobering vicissitudes, but he remained faithful to the convictions of his prime, and in "Travailleurs de la Mer" and "L'homme que rit" we have a testimony to the influence which ugliness in physical and in mental forms still exerted over him, and, as he believed, over the world also.

In painting there was likewise a revolution of the same kind in France. Both domestic scenes and classic scenes in the spirit of DAVID ceased to be attractive. Murders, executions and criminal deeds became the delight of Frenchmen. DELACROIX, who was morose in disposition, might be excused for being captivated by the dark deeds of history. But we find such a man as the placid PAUL DELAROCHE was also allured, and in his smooth way painted scenes like "Cromwell gazing on the Corpse of Charles I.," "The Murder of the Princes in the Tower," "The Execution of Lady Jane Gray," "The Murder of the Duc de Guise," "Cinq-Mars a Prisoner," "Queen Elizabeth Dying on the Floor," &c. In these we have indications of a change which was not in keeping with the painter's nature, for, as HEINE said of him, he was without any love of antiquity. DELAROCHE, like many other artists, had not the strength to resist the spirit of the time. That spirit was also observable in the abundance of caricatures. It was necessary to have new prints every day in the shop windows by which ministers and other notabilities were degraded. Unfortunately the fashion has been enduring. Paris is still notorious for its efforts to make ugliness supreme, not only in miserable caricatures, but in the various forms of Impressionism adopted by painters: in whose works humanity is brought down to a level as low as that of the caricaturists. The ancient artists who first devised hydras and chimeras dire could not have anticipated the consequences of their works as manifested by artists in Paris. There was a time when BOILEAU expressed the prevailing belief in France, according to which ugliness could not be touched by the artist's hands without being transformed, for, as he said:—

Il n'est point de serpent ni de monstre odieux
Qui, par l'art imité, ne puisse plaire aux yeux.

It is not so now, for French art can make objects become odious which for generations were held as sacred.

Although ugliness was never so commonly produced as in Paris, it cannot be denied that it has held sway upon great artists. All who have looked at drawings by DA VINCI, than whom there was no greater lover of beauty, or at reproductions of them, must be aware of the fascination ugliness exercised over him. He must have taxed his inventive powers to produce hideous faces. One of his earliest recorded works is a *rotella*, on which he painted a monster that was said to inspire fear in most of those who looked on it. He also busied himself in repulsive imitations of living things. But in the few pictures which we have from his hand he avoided whatever was ugly, although in the mysterious *Vierge aux Rochers* it would have been easy to introduce fantastic beings amongst his icy crags. ALBERT DÜRER, who was also a great master, did not hesitate in one of his etchings to represent a monkey as chained to the chair in which the Virgin and Child are seated; it is entirely inapposite, for it does not serve as a contrast, and can only be supposed to be the whim of a moment. Our own HOGARTH engraved so many displeasing figures that some critics have even doubted whether he could draw a handsome

man or woman. He was cynical, and like DIOGENES must have found it difficult to discover anyone who was really honest. His ugly characters are therefore legitimate. The contortions of the youth possessed by the Devil in RAPHAEL'S *Transfiguration*, and the maimed figures we see in some of his great wall-paintings, were called for by the nature of the scene. SCHELLING, in fact, maintains that an idea cannot be completely represented without the aid of ugliness in some form, and he could point to several of RAPHAEL'S greatest works and to MICHEL ANGELO'S *Last Judgment* in support of his theory. REYNOLDS, in some of his compositions, evidently favoured the principle, but the neglect of such work testifies to the love of prettiness which is inherent among English people.

When we speak of ugliness and beauty it is not easy to draw the line which separates one from the other, and all those who talk as if there were a definite line of demarcation are in error. RUSKIN, for example, says "there is not a single object in nature which is not capable of conveying ideas of beauty," and we suppose he was as industrious and keen-sighted an observer as ever lived. But PROCLUS, who belonged to the fifth century, and who was likely to have known a great deal about the principles employed by the Greek artists, is quoted by REYNOLDS as an authority for the saying that "the works of nature are full of disproportion," and REYNOLDS, emboldened by the words, declares that "all the objects which are exhibited to our view by nature, upon close examination will be found to have their blemishes and defects. The most beautiful forms have something about them like weakness, minuteness, or imperfection." This is only another way of saying that all natural objects are ugly. Assuming that to be the case, ugliness becomes another name for realism, and those who intend to represent forms as they are created can claim to be inspired by a love of truth. Is it not preferable to show things as they are as the results of the operations of an immense number of natural laws, than to attempt a re-creation which in the eyes of those who are competent to judge can only be an exhibition of weakness? Unfortunately, however, realism generally descends below nature and magnifies defects. Ordinary nature does not deserve to be considered ugly, a word which means something frightful or dreadful, and has its equivalent in the German *hässlich*.

An attempt was made about forty years ago by ROSENKRANZ in his "*Ästhetik des Hässlichen*" to divide ugliness into classes. The first he termed *Formlosigkeit*, or formlessness, and which was subdivided into amorphousness, asymmetry, and discord. The second class was in correctness, either in general, or in departure from styles, or from special rules applicable to an art. The third class was *Verbildung*, or malformation, including repulsive things and caricatures, and much else until we arrive finally at the Satanic. In other words, the German metaphysician confirms the old Persian belief, and the worst possible form of ugliness is concluded to be inspired by AHRIMAN.

We have only touched upon a subject which is as old as art. It is remarkable that in all which has been written about it by ancients or moderns, little attention was given to architecture. Undoubtedly there have been ugly buildings, or at least they offended against ROSENKRANZ'S laws about correctness of styles and need of symmetry, but it cannot be said of the worst of them that the offence was committed by men who could have done better. Architecture may have been "adorned" by unpleasing paintings or sculpture, but it will generally be found that such ornament could be eliminated without loss to the building. All that is said, therefore, concerning diabolic influence does not touch architecture. There is no certainty that architecture will always be free from the reproach. In France, where ugliness is so often condoned under the name of realism, attempts have been lately made to design buildings in a spirit of revolt against all the old canons. The topsy-turvy building which was created for the last International Exhibition was only a manifestation on a very large scale of the boldness that is seeking outlets for the display of its license. The buildings, however, are likely to be looked upon as fantastic, bizarre or novel, and they at least will be more in keeping with some modern pictures, statues and novels in France than if they had been designed by aid of the observance of academic rules.

NEW BOOKS.

THE approach of winter inspires publishers with the belief that they must provide books for the long hours when artificial light has to be used. They complain in summer about the out-of-doors attractions, which allow only of a study of nature. Books have to be substituted in winter for all that can gratify the eye on summer evenings, and it must be allowed that they are now presented under appearances that remove many of the difficulties which made reading irksome some years ago. Technical books have also been vastly improved, and those especially which relate to architecture are rarely suggestive of the obstacles which have to be encountered by all who take up the study of the art in earnest. If type, illustrations and binding of improved descriptions could make a royal road to learning, ignorance would soon be overcome.

A third edition has appeared of "The Chemistry of Paints and Painting," by Professor A. H. CHURCH, F.R.S. (SEELEY & Co., LTD., London). From his relations with artists as a Professor of the Royal Academy, there is no chemist in England who is so qualified to speak of paints, and their effects when laid on canvas, plaster and paper, as the author of this book. In his hands the science seems to be very different from what is usually found in books on colour, inasmuch as he is able to utilise the experience of many painters. From the manner of treating the subject, amateurs can also find pleasure, as well as instruction, in the pages. There are artists who undervalue chemistry as an aid. The author was once asked:—"TITIAN managed pretty well without chemistry, did he not?" But, as Professor CHURCH says, in TITIAN'S time "grounds, paints, oils and varnishes were generally prepared in the studios of the artists and under their own superintendence, so that the chances of going wrong were comparatively limited." The book is divided into four parts, which treat of painting-grounds, vehicles and varnishes, pigments, methods and results, and the various chapters show not only knowledge of chemistry, but of the painter's art. All who use Indian ink in architects' offices may not be aware that a treatise on its manufacture by a Chinese author dates from 1398. Old sticks are sought after by Chinese amateurs, who pay for them not less than their weight in gold. They are not, however, intended for use. The Japanese rub the ink in straight lines backwards and forwards, and the ink slab is of dark slate. Professor CHURCH says that no colour prepared from cochineal should be found on the palette of an artist, and he cites a case where a strong wash of crimson lake lost 8 per cent. of its original intensity on an April day; but lake somehow lasts long when used in architects' drawings. It is a curious fact that sepia derived from fossil cuttle-fish has the same hue and chemical character as what is derived from the cuttle-fish of to-day. Prussian blue fades under exposure to strong light, but "a brief sojourn in darkness generally suffices to restore the hue almost to its original depth and quality." Gamboge is described as losing more than half its original intensity when used from the cake, while moist gamboge only lost a tenth. In offices cake gamboge finds little favour. A piece of a pipe bought from a druggist is generally found to yield a more enduring colour. Every one who uses water-colours or oil-colours will find it advantageous to make an attentive study of Professor CHURCH'S manual. It is, however, hardly fair that painting alone should monopolise his ability as a chemical lecturer. His services should be utilised by the Royal Academy for other lectures in addition to those on colour, for both students of sculpture and architecture would be gainers if Professor CHURCH were able to address them every year.

Although books relating to the history of sculpture are to be found in most languages, there is a singular dearth of treatises on the practice of the art. The new book entitled "Modelling, a Guide for Teachers and Students," by Professor LANTERI (CHAPMAN & HALL, LTD.), meets a want which has long perplexed students. Nowadays a great many of them are eager to learn the rudiments of a science or art from a book, for having the *mauvais honte* of Englishmen they do not care to expose their ignorance or awkwardness before those who may jeer at them. Embryo sculptors cannot find a better primer than the new guide, the object of which, as Mr. ONSLOW FORD says, "is to teach the

student how to begin," and he adds:—"Had such a book been obtainable when I was in the twenties I would not have rested a moment until I possessed a copy, and when possessed of it, it would have been my constant companion. Professor LANTERI has put in very comprehensive language everything that is needful for the young sculptor to know. The result of very careful thought and observation of years is set forth in a manner so clear that it may appear to some readers that, after learning Professor LANTERI's book by heart, they will then know how to model." The student is advised to begin copying from a cast all the features separately of the face of MICHEL ANGELO'S *David*. Next, the head as a whole is explained. The student then is shown how to model the features from life, and in the third division the different parts of the figure are dealt with. Instructions are given in general anatomy as the course proceeds and the language is as simple as possible—in fact, the instructions are a development of the notes which the author uses in his demonstration classes at the Royal College of Art. Professor LANTERI is a believer in individuality, and he is careful to avoid everything which could be looked upon as imposing his own style on students. The beauty of the contours in the human figure and in famous statues is insisted on, as well as the relation between the parts and the whole body. Thus, he says in one place, "every study ought from the beginning to be considered as a composition. You must, therefore, at once block in the extremities, whose position will determine the action of the rest of the body. You cannot possibly model an arm properly without having carefully modelled the hands, in which you find the insertions or terminal points of most of the muscles of the forearm. It is, therefore, the natural continuation of the shape of the arm. The same rule applies to the legs and feet." There are a great many illustrations from the author's drawings, but what best sustain the character of the book are the photographic reproductions. By their aid the progressive stages in modelling busts and figures are clearly exhibited, and the student is enabled to realise the great difference which can be made by a few strokes, or by the addition or subtraction of clay. The plates are, in fact, almost equal to a demonstration by a clever sculptor. Modelling is now more generally taught than formerly, and for many purposes it is preferable to drawing. Professor LANTERI's book is hardly sufficient by itself to make a GIBSON or a FOLEY; but for those who are unable to attend classes of sculpture in schools it ought to be equal to instructing them in the processes required for modelling for ornament and other applications of industrial art.

Two more volumes have been added to the useful "*The Builder Student's Series*" (D. FOURDRINIER). "*Sanitary Fittings and Plumbing*," by Mr. G. LISTER SUTCLIFFE, describes in a limited space the latest apparatus connected with the drainage of houses, and as there are over two hundred illustrations the varieties can be easily imagined. The author is impartial, and what he says about apparatus can be relied on. Among the most ingenious of the new appliances is the surgical laboratory fitted up by Messrs. SHANKS & Co. in the Western Infirmary, Glasgow. The supply of hot and cold water is obtained, and in fact all action is controlled, by means of treadles. It is not necessary for an operator to touch a tap or any part with his fingers, which may be on account of disease germs in a dangerous state. All parts are easily cleaned, and the slabs are of thick glass. The lavatory suggests the thought which is now bestowed on sanitary affairs by manufacturers. "*Roads, their Construction and Maintenance*," by Messrs. GREENWELL and ELSDEN, is a treatise which, unlike most of those on the subject, has little which can be called empiric in the pages. The first part describes the lithology of the subject, and in that way the relative importance of various materials can be realised. Roman roads are remarkable, and some of them have endured to our time. But barely more than a century has elapsed since in England and France a lesson was taken from the Romans and applied under altered circumstances. At the present time there is still divergence between the opinions of engineers about what constitutes a thoroughly serviceable road. Much depends on cost, and it must be allowed that in this country the road surveyor has not an easy office. Two of the

latest forms of pavement, for example, are the indiarubber pavement and the cork pavement. In an ideal town both would be largely laid down, but owing to their costliness they are now applicable only to very favoured spots. In London, where all problems in engineering construction should be tried, it seems useless to bestow much thought on the question of road construction. So long as gas companies and water companies can in turn tear up the most compact surface for a trivial purpose, it is only waste of money to adopt improved systems. In the Metropolis roadways can only be looked upon as temporary constructions, and under such circumstances as prevail it is wonderful that so much care is exercised in their construction.

A great many of the papers which are read before the architectural societies deserve to be published in book form, but the expense is the main obstacle. Messrs. BARRY PARKER and RAYMOND UNWIN have endeavoured to get over the difficulty by adding illustrations from their architectural drawings to the papers, and combining the whole in a book with the attractive title "*The Art of Building a Home*" (LONGMANS, GREEN & Co.). The authors express the desire to provide middle-class houses and small houses and cottages which would not resemble those which are erected by the thousand, and in the illustrations there are many novel features. But we doubt if the ordinary occupier will care for a house in which drawing-room, library, hall and kitchen are combined to form one apartment, in which the kitchen range forms a pendant for the piano. That combination, however, in idea at least, corresponds with an ancient class of British residence, and we conclude there are some people who still hanker after it. In the drawing the arrangement has the appearance of novelty, but the servant-girl difficulty could not fail to be increased by it, for it would be a restriction on the liberty which is now enjoyed in kitchens. As experiments homes of the kind represented might be erected. The authors, however, do not enter into questions of finance, and we are therefore in the dark about the cost of those smaller middle-class houses and cottages and the rent which could be obtained for them. One of the authors says:—"In building a man's shell for him we certainly can influence very largely the life he will lead within it; and while it is our duty to make that shell fit the life as well as possible, it is surely also our privilege to make it conduce to the realisation of the best of which he is capable. In so far as we do this, we shall rise above the mere planner of houses and take our places in the work of planning and moulding the future life of the people." These words are expressive of a high aim, and as all the essays are in a similar spirit, the book may become popular with people who have grown weary of living in houses which bear a family likeness to those of their neighbours.

The edition of the London Building Act which the late Professor BANISTER FLETCHER prepared has gone through two editions, which is proof of its practical character. A third edition has been brought out by his sons, and is published by Mr. BATSFORD. There has been a rearrangement of some parts, more plates have been introduced, the revised regulations and drainage by-laws of the County Council are added, as well as those issued by the Public Health Department of the Corporation of the City of London. The latest edition is consequently more complete than its predecessors, and deserves as much success. A copy should be found not only in the office of every architect who undertakes work in the Metropolis, but also with builders and contractors. Mr. BATSFORD has issued a new edition by the same editors of Professor BANISTER FLETCHER'S text-book of valuations and compensations.

Mr. Raymond Unwin, architect, delivered a lecture at the Hall, Clifford's Inn, on "*The Housing of the Working Classes by Municipal and other Bodies*." Mr. Unwin advocated as a general policy that municipalities should try to build a large number of houses not only for the very poor, but for the general working classes in the suburbs, that every house should have a sunny aspect and that there should be something designed in the way of outlook. He advocated that the cottages should be arranged in quadrangles rather than in narrow streets.

NATIONAL MEMORIAL TO QUEEN VICTORIA.

WE publish this week illustrations of four of the designs submitted in the competition for the National Memorial, and the following are copies of the notes which accompanied of them:—

DESIGN BY SIR THOMAS DREW, P.R.H.A.

The monument to Queen Victoria is the central object of the whole scheme, to which all rearrangement of lines of approaches, architectonic surroundings, and its background as afforded by the Palace when seen from its principal line of approach, should conform and lead up to in study of effect.

The Line of the Mall from Spring Gardens to the Palace.

The Mall is now divided into three alleys by low rows of trees. The line of no one of these avenues is directed to the centre of the Palace. The trees as standing would obscure the monument and statue as a central object of the Mall until it was nearly approached.

The alignment of the Mall for its entire length has to be dealt with, its central axis being directed to the monument. I desire to make it a straight line without deflection from Charing Cross to the monument.

I propose its centre line as drawn from a point about 35 feet to the north of Drummond's Bank, so avoiding that valuable property. This would mean the acquirement of frontage properties to give 70 feet for a clear width of opening into Spring Gardens.

Having passed into the cleared space of Spring Gardens, the newly-aligned avenue would be of a clear width of 100 feet throughout.

Trees worth preservation can be moved back to afford this cleared approach.

The Entrance at Spring Gardens End.

Sufficient dignity for an architectural triumphal entrance to the Grand Avenue is not attainable in any design of arch or entrance brought forward to the frontage of buildings in Charing Cross incongruous with it.

My project of approach is, after passing from the street architecture of Charing Cross, to enter a forecourt of architectural dignity, named on my plan Spring Gardens Court. Its width is 110 feet. It is flanked by elevations of stately scale and monumental character, which lead up to a triumphal arch entrance to the great memorial avenue.

The creation of an architectonic effect and composition lends itself to the practical provision of sites for public offices in Spring Gardens.

By an alternative arrangement with Parliamentary powers an area might be acquired in connection with the London County Council premises sufficient for its permanent extension and home.

Improvements within the Entrance.

A first disfigurement at present met is the frontage of the low terrace in advance of the houses of Carlton House Terrace. It is suggested that by arrangement a palisade of architectural dignity, aligned to the Grand Avenue, might be substituted for the row of ugly "stump" columns which are such an eyesore. The details of an improved frontage flanking the avenue for a length of 1,000 feet need not be dwelt on.

A Procession of Sculptural Monuments.

Having designed such an avenue as lends itself to such a scheme, it is unnecessary to define a distribution of such monuments at this stage.

The Central Monument.

I fix the position for this at a central point 295 feet in advance of the façade of Buckingham Palace. I surround it with a circular plinth enclosure, without railings, 300 feet in diameter. I suggest no canopy or architectural shrine over the statue as being injurious to the lighting effect of the sculptor's work, and as being also an object necessarily of such scale as would eclipse the Palace front.

A Background for the Monument.

The front of Buckingham Palace, built in 1842, cannot be said to be a work of fine architecture or a background of dignity for the great memorial.

A memorial composition standing say 60 feet high would not eclipse the Palace front, but would somewhat subordinate the central entrance as its leading feature. My proposition is to recast the façade architecturally without changing its fenestration or altering the internal arrangement. I would raise a pavilion block at each end, advanced from the building, which would give cast shadow to break the monotony of the elevation. The front I would remodel—accepting the present levels and window spacing—by applying a Corinthian order elevated on a rusticated or coursed basement, as an improvement of the present lowest storey. I submit a detailed elevation for an architectural front.

The Avenues Surrounding the Memorial.

It is absolutely necessary for a sweep of avenue leading to Buckingham Palace Road and Victoria to rearrange the boundary of St. James's Park and borrow some room from it.

I propose an alteration of the ornamental water at this end. To give water area undiminished for boating purposes, I extend two bays into low ground on either side, which are prettily backed by wooded slopes, as an improvement in picturesque contour of the lake margin.

By the right-hand sweep (80 feet in width) approach to Constitution Hill is led up to.

An Approach from Piccadilly.

As a further development, but not necessarily an indispensable feature, I suggest an avenue of approach through the Green Park from Piccadilly at right angles to the Mall, and bearing down also on the memorial as its central object of view.

Auxiliary Sculptural Groups.

The placing of these seems to me to follow the consideration of the central memorial design, and a subject for agreement and collaboration between sculptor and architect at a future stage.

DESIGN BY MR. T. G. JACKSON, R.A.

I have assumed that the Mall will in any case be replanted on the lines shown in the official plan, but in other respects I have availed myself of the liberty allowed to the competitors to depart from the arrangement there laid down.

At the west end of the Mall in front of the Palace I form a regular square or "place" enclosed by colonnades, and partly occupied by gardens. It seems essential to the dignity of the scheme that this part should be laid out on formal lines, having relation to the façade of the Palace and the straight avenue of the Mall beyond. I have also thought it important, so far as it can be done without inconvenience, to divert all public carriage traffic from this area. The cross road from north to south in front of the Palace must of course remain, but I make the two public carriage roads which run east and west to pass entirely outside of the colonnades, which would screen the enclosed space from dust and noise, allow the monuments it contains to be enjoyed by the public without interruption and to add materially to the quiet of the Palace itself.

It will be seen from my plan that this makes the line of road by Constitution Hill considerably more direct than at present, and provides a second carriage road on the other side.

The enclosed square is shut off from the Mall by a screen of piers, railings and gates, which excludes public wheel traffic, but gives foot passengers free access to the gardens and enclosure. Gates, however, at each end of the screen would be opened for carriages going to the Palace at receptions, and the royal gate in the middle for the King when going in State to Westminster.

The Queen's monument would occupy the centre of the square. Right and left of it I have placed a fountain of bronze in a basin of stone, and round it are groups of statuary representing the principal colonies and dependencies of the Empire. The area would be gay with flowers and shrubs in grass plots, and the colonnades would afford shelter and shade, and would be admirably suited for spectators at State processions for whom the flat roof would also be available.

The back wall of the colonnades affords space for inscriptions and national memorials in sculptured relief to be added from time to time, for which there is at present no such place available in London.

The four pavilions at the angles would bear the royal arms and cypher, and be adorned with bronze figures representing arts and industries.

The central part of the square is left open to afford space for carriages at State receptions.

The Mall.

The Mall, planted as proposed by the official plan to which I have adhered, forms three avenues. The two outer are public carriage roads. The middle one, besides a 40-foot road in the middle, has a wide grass plot on each side, affording space for the contemplated avenue of statues. The central avenue would be open to the public by day, but I propose to enclose it by railings with gates to be locked at night for protection of the statues—a precaution which experience both at London and Berlin proves the necessity.

On State occasions the King would drive down this central avenue, but otherwise it would never be used by carriages.

The Arch.

At the east end is the great arch through which the royal carriages would pass on State occasions.

It seems better to place this at the entrance to the Mall proper than at the spot marked on the official plan. Eastwards of the spot where I have placed it the Mall expands

into several diverging thoroughfares, and its continuity is lost; and the arch would seem to lose its meaning unless it admitted specially and directly to the road leading to the Palace. The effect of it also in combination with the steps leading to the Duke of York's Column would, I think, be very good. The exact position of the arch, however, is not material.

In its design I have aimed mainly at simplicity and dignity, avoiding ornament except of the highest kind, and emphasising mass and proportion. In either of the positions suggested it will have to compete with the high buildings of Carlton House Terrace, and it must be on a grand scale, or it will be dwarfed by its surroundings. The Marble Arch, which is only 42 feet 8 inches high, or the Wellington Arch, which is 62 feet high, would in this case look quite insignificant. I have made my archway 60 feet high and 30 feet wide, the height to the top of the cornice of the main order 79 feet, to the top of the attic 93 feet, and to the top of the sculpture which crowns it 120 feet. The area of the structure is 68 feet by 34 feet, and, besides the simple colonnade which carries the vault, the only positive ornamental details are a bronze frieze of life-size figures, representing the Jubilee processions of 1887 and 1897, which runs round the outside above the podium, and the colossal group in bronze at the top consisting of Britannia and figures emblematic of her naval supremacy.

The following dimensions may be useful for comparison:—

Roman arch of Severus,	75 feet high	82 feet wide.
Roman arch at Rheims	110	"
Arc de Triomphe, Paris,	158 feet high to top of acroteria	150 "

General Scheme.

The whole scheme beginning with a stately arch, continuing with avenues of trees and statues along the Mall, and reaching a climax in the colonnades and gardens of the new Palace square at the west end would, I venture to hope, be a not unworthy expression of the nation's grateful remembrance of her Queen, and it would, I think, compare favourably with anything of the kind to be found in other European capitals.

In conclusion, it may be observed that the whole scheme is divisible into parts. The arch is quite distinct from the rest, and the series of statues in the Mall would, of course, be added one by one as occasion arose and means were found.

As no estimates were asked for, I have made the best design I could without considering expense, but I do not think any part of it is unduly costly. The most expensive feature would be the sculpture, of which, as I have said, the greater part can be carried out piecemeal.

The material I propose generally for the masonry is hard Portland stone, which is not only the most durable and best able to resist the climate, but is also the most beautiful material for London use, bleaching as it does with exposure to a more than marble-like brilliancy.

ART AND LIFE.

ON Monday last Sir William Martin Conway delivered his inaugural lecture as the Slade Professor of Fine Art in the University of Cambridge. He said it would be idle for him to pretend that in undertaking the duties of Slade Professor he was without misgiving. It was exactly ten years since the study of art-history ceased to be the main pre-occupation of his life, and was exchanged for the engrossing cares and excitements of a more active career. He could not, therefore, stand before them clothed in the panoply of complete knowledge of the latest discoveries in art-history or the finest nuances of recent art criticism; but art was wide as life itself, and whoso had once given himself to her never escaped her sweet enthrallment. Joy in life, that was what originated art; that was the end which it served. Where there was joy art must assuredly arise—in the life of action as in the life of contemplation, amongst the humble as amongst the rich, in the backward as in the most advanced races of mankind. It was only in the miserable dregs and equally miserable froth of humanity that art was unknown. Art might be defined as the manner in which a material was used for the production of beauty. The material might be language, or the movements of the body, or sound, or life itself, as well as stone, or plaster, or paint, or ink and paper. In the moulding of all these things art might arise, so that there lived no human being, how poor soever, who might not beautify his life by art. Whatever was done for the sake of giving pleasure to some one else belonged to the category of art. That which a man did solely to please himself was not art. Herein lay the distinction between art and sport. Art was not the mere exercise of skill, but it was the exercise of skill to a definite end, and that end was, in the strictest sense of the word, pleasure. He that could find beauty anywhere in the wide world of nature or man had the root of the artistic disposition within him, though the technical skill to realise it might be absent. He to whom any work of art had ever appealed, awakening in him the unmistakable thrill of joy, had

the capacity of artistic recipience, which time, opportunity and will were only needed to develop. When once the emotion of beauty had been quickened in a man he would enjoy a similar experience better next time; then one less similar. His delight would be spread over a whole category of experiences, and thus he would become receptive to one form of art. The two human faculties which a work of art implied, the creative and the receptive, were thus both capable of development. Where the faculty existed it could be developed. The conviction that this was so was shown by the multitude of art schools where, with civilised countries were now provided. But it was a remarkable fact that the perceptive faculty received hardly any attention at the hands of educationists. Governments and municipalities would spend money enough on making artists, who when made would be unable to live, unless each of them could find a considerable body of amateurs to buy his work. Yet the same Governments and municipalities which subsidised art schools were by no means correspondingly intent on developing the perceptive faculty in the purchasing public. They would hold an occasional exhibition, and even, perhaps, form a permanent gallery of paintings, as though pictures were the only art; whilst in the incompetent planning of new streets and erection of public monuments and buildings, in the obliteration of open spaces, the destruction of scenes of natural beauty, and such other perverse object-lessons they more than counteracted the educational effect of their vaunted exhibitions. For example, a body of public opinion was now forming in favour of what was called the taxation of site values. But neither its proposers nor its opponents seemed to have made the smallest attempt to consider what effect such taxation, in the form in which it was shadowed forth, was bound to have upon the beauty of our towns. Such a tax would fall with ruinous effect upon the owners of open spaces and plots of garden-ground not yet invaded by the flat-builder. Now one of the greatest glories of London was its little private gardens, remnants of the country engulfed in the great city. These little gardens were not merely a joy to their owners, but also to all the neighbours whose windows commanded a glimpse of them, and they formed valuable lungs even for houses that were out of sight. So far from garden-owners being penalised in a great city, they ought rather to be endowed. Whatever legislation tended to cover every inch of ground in a city with buildings was pernicious. Every scrap of ground kept as a garden in a city should be rated and taxed on the lowest scale. If land values were to be taxed, all gardens should be exempted from such taxation. Indeed, in the case of large and growing cities it might be justifiable, in the interests of the common weal, to set a limit to the amount of surface that might be built upon. Another social habit of ours that must blight nascent popular taste was the habit of confiding to committees of more or less eminent gentlemen the ordering of local or national monuments. In matters of taste committees were anathema. All that a committee had any power to do efficiently was to choose an artist for the work in hand and then to let him do it. Utterly detestable, too, were so-called competitions, when a selected or an unlimited number of artists were invited to submit designs. The great need, from the point of view of the production of fine art, was the education of the amateur, the purchaser. How was this to be accomplished? That was the problem that faced each occupant of the Slade chairs in the Universities of Oxford and Cambridge. For to answer that question was the end for which they were founded. It was not his function—Heaven be praised—to prepare any one for that vile modern ordeal, an examination. It was his duty to tell them that art was a necessary part of healthy human life, that there was nothing effeminate about it, nothing unhealthy, nothing ignoble. All art was based on joy and the man who had developed in himself this gift of joy was not thereby rendered less manly, less fit for the life of action less apt to noble deeds; rather was he the manlier man to whom the treasure-houses of life opened at his coming, and for whom mankind and the world of nature had been made so fair.

ARCHITECTURAL ASSOCIATION OF IRELAND

AN exhibition of drawings prepared by members of the Association has recently been held in the rooms of the Royal Institute of the Architects of Ireland, by the kind permission of the President and Council of that body. The drawings consisted of the competitive works of members for the various prizes offered during the past session, and were a remarkably creditable collection, and indicate a very decided improvement in the skill of the young architects of Dublin both as regards design and draughtsmanship. Prominent among the drawings were nine large sheets of accurate measured drawings of St. Patrick's Cathedral, Dublin, splendidly executed by Mr. T. A. Rockett, who won the prize—the Association Travelling Studentship—in competition for which they were prepared. Another extremely good set of measured drawings were shown

Mellifont Abbey, by Mr. A. C. Scott, of Drogheda. Seven sets of drawings were shown which had been prepared in competition for the prize offered by the Royal Institute of the Architects of Ireland for the best design for a technical school. The prize drawings, by Mr. Charles Powell, were executed in black, and showed a good honest plan. Three sketches of the campanile in the quadrangle at Trinity College were on view, one by Mr. L. O'Callaghan taking the Beckett prize. The class drawings which were exhibited demonstrated the fact that real hard work is done by the members, and that the object for which the Architectural Association of Ireland was founded is being very well held in view—that is, of providing a school wherein the younger members of the profession in Ireland may acquire knowledge of design and draughtsmanship. As an educational body for young architects this Association has become firmly established.

BRECHIN CATHEDRAL.

BRECHIN CATHEDRAL, surviving the vicissitudes of centuries, suffering much from the ravages of time and more from the hands of man, stands to-day, says the *Scotsman*, restored to something of its pristine beauty. Patience, labour and loving skill have had their perfect work. The old church will be reopened with the fitting solemnities as soon as the allocation of seats is made by the sheriff of the county. Without entering on the philological controversy which rages round the name "Brechin," it is not impossible that the site on which the cathedral stands was once the seat of the Druid worship. Succeeding the Druids came the Culdees, to whom we are probably indebted for the erection of the Round Tower, circa 1000 A.D. The belfry of this unique monument is obviously of later date, and may be put down to the period of the present church—probably about the middle of the thirteenth century. The cathedral was dedicated to the Holy Trinity, and had its origin in the founding of the diocese by King David I, that "sair sanct for the Crown."

The choir was long in ruins, the great arch between it and the nave having been filled up. Previous to the wonderful "restoration" of 1806 there were transepts, which were then removed. With the exception of the walls of the nave, its arches and pillars, the west gable and the massive square tower at the north-west corner, nothing was left of any previous work when the 1806 restorers rested from their sacrilegious labours. New aisles were built, and the whole edifice roofed over so as to enclose the quaint clerestory. Huge galleries were erected in the interior, and the whole building was decorated with plaster and whitewash and lighted by great windows in the most approved style of heritor's Gothic. It was long the ambition of the citizens of Brechin to restore the ancient cathedral, and with the examples of St. Giles and Dunblane before them, their case was not a hopeless one. Money of course was the prime need, but perhaps even a more formidable obstacle lay in the fact that any possible restoration would reduce the number of sittings below the standard required for the parish church. With the erection of a new church in the town that obstacle disappeared, and it was at the laying of the foundation-stone of the new church that the Right Hon. James A. Campbell, M.P., first mooted the restoration as a pressing and practical scheme. The consent of the heritors was obtained, and at a public meeting resolutions were carried commending the scheme, and a committee was appointed to raise funds. The plans adopted were those which were prepared some years ago by Mr. John Honeyman, R.S.A., at the instance of the late Rev. Alexander Gardner. With some modifications the plan carried out is practically the original scheme. The subscription list was headed by the Right Hon. James Campbell, who gave 1,000*l.*, and by an anonymous donor since known to be Mr. David Jamie, a native of Brechin, now residing in Edinburgh, who gave a like sum. The heritors, the citizens and the congregation contributed liberally, and money came in from all parts of the kingdom and the Colonies, to what was properly regarded not as a parochial but a national work. With a quota from the Heritor Trust—that golden reserve of the Church—the committee justified in proceeding, and operations were begun in January 1900. The memorial-stone was laid in September of the same year with all Masonic honours, by the Hon. James Mackenzie, M.P., Grand Master Mason of Scotland. The first step was to pull down the galleries and strip the plaster from the walls and pillars. It was then that the full iniquity of vandalism was revealed. The masonry in many places was ruthlessly, not to say wantonly, hacked and chipped. The old aisles were pulled down, and new aisles erected. Two transepts and a porch were added, and, crowning glory, the ruined choir was rebuilt on the old foundations. To take the choir first, it is remodelled after the rich and quaint fragments which were

left, and is pierced by five lancet windows on each side and three in the east gable after the same design, with a small rose window over. It is built like all the other new portions of fine-dressed sandstone from Ardovie quarry, is roofed with oak and furnished with two rows of oak stalls on either side. The south aisle wall has three triple windows under one hood moulding, and in north and south ends of the same aisle are two-light windows with trefoil. A small transept has been built on the south side on the foundation of a prior one. It has a large window filled with Geometrical tracery and a small door of the Norman type, in the tympanum of which is the symbol of the Holy Trinity. Beneath this transept there is a large chamber for the heating apparatus. The north aisle has two windows similar to the triple windows of the south aisle, and at the east end a two-light window corresponding to the one on the other side. The beautiful new porch built upon previous foundations opens into the centre of this aisle. It is enriched with deeply-cut carving both on outer and inner doors, chiefly of the dog-tooth and reed patterns. The roof is of oak, and stone seats flank the inner walls.

The north transept extends the length of two bays on this aisle. It is professedly an addition to the church, and of a later and more elaborate style of architecture. In the west end is a rich Flamboyant traceried window; on the north side two smaller traceried windows, and in the east gable a large rose window with exquisite stone tracery. This part of the church, like the chancel, is roofed with oak, and the carver has been allowed to exercise his skill freely on the pillars and mouldings of what in some respects is the finest feature of the church. The pillars of the nave have been skilfully repaired, and the kind touch of time will soon remove the traces of the restorer's hand. At the west end of the nave a small gallery of oak has been erected to accommodate the choir and the organ, and care has been taken not to obscure the large old Flamboyant window in the west gable. The old chapter-house in the base of the square tower has been stripped of its plaster, and with its fine groined roof and small lancet windows is well worthy of the work expended. The handsome "hearse" or brass chandelier bearing the arms of Andrew, bishop of Brechin, 1615, who gifted it in that year, is hung in its old place in the centre of the nave, and, like the rest of the church, is fitted with electric light.

Several valuable gifts have recently been made and are now placed in position. A native of Brechin has filled all the windows of the choir with the best stained glass. The scheme of subjects was prepared by the Rev. A. D. Tait Hutchison, and the effect as one approaches the steps of the chancel is wonderful. On the north side the windows display scenes in the life of Christ prior to the public ministry—the Nativity, the Flight, the Presentation, the Baptism, the Temptation. On the south side there are the Transfiguration, the Betrayal, the Crucifixion, the Resurrection and the Ascension. In the east gable of the choir the three windows represent the Redeemer's offices as Prophet, Priest and King; while the rose window over is filled with the Agnus Dei surrounded with cherubs and seraphs. The windows were executed by Mr. Henry Holiday, artist, London. At the east end of the south aisle the window is filled by figures of St. John and St. Peter. This window was erected by public subscription to the memory of the late Rev. John A. Clark. The corresponding window in the north aisle, containing figures of Isaiah and John the Baptist, is erected by Mrs. Shireess Will, of Ardovie, and her sisters, the Misses Shireess. The communion-table, made of fine oak, was the gift of the Women's Guild of the congregation. So was the pulpit, a beautiful piece of oakwork, with cusps and canopied niches containing figures, which stands at the south respond of the chancel. At the north respond a large Corennie granite font has been placed by the Rev. William Duke, D.D., of St. Vigeans, in memory of his parents.

The cathedral is a small one, and the clerestory and arcading is not so rich as was expected, but it has a simple dignity which makes it wonderfully attractive. Mr. Honeyman is to be congratulated on his work, which in many respects was not an easy one. It has been a true restoration, and every clue to the original has been followed up anxiously and conscientiously. Some of the new carving has been copied from old stones discovered in the masonry of the 1806 aisles, and it is interesting to note that Mr. Honeyman is of opinion that an earlier Norman church once occupied the site of the Gothic church now restored. Everything that could be spared was spared, and "the waste places of former generations" have blossomed into new beauty under the loving skill of the architect. It is fair to say that the restoration could not have been accomplished in anything like the time but for the interest and activity of the ministers of the collegiate parish, the Rev. John A. Clark and the Rev. A. D. Tait Hutchison, the former of whom died last year, to the great grief of the community. Something like 1,300*l.* is still required by the committee, for whom the National Bank, Brechin, gladly acknowledge subscriptions.

NOTES AND COMMENTS.

WE lately mentioned the friendship of M. RUPP, who for years devoted himself to GUSTAVE MOREAU, the French painter. He not only acted as factotum, but he endeavoured with all his might to convince the world that the greatest of all painters was his friend. MOREAU died, and M. RUPP became his sole heir. There was some money, and the entire property was valued at about 20,000l. It was understood between the two friends that 4,000l. was to be given to the Institut in order to found a prize as a memorial of the artist. M. RUPP paid over that sum. He then proposed to endow the State with MOREAU's works, and proposed that they should be hung in the building where the painter had resided. The Government decided to undertake the possession, M. RUPP paying all the charges. But they declined to keep up the museum, to heat it or guard it. M. RUPP offered to surrender every sou which he had inherited or possessed, but that was not sufficient. The Institut under the circumstances resolved to hand back the 100,000 francs towards the expenses of the museum, but no sign was given that the Government concended to accept the pictures, house and money. It seems incredible that for about three years M. RUPP has been compelled to defray all the charges which arose out of the existence of this gift to the public. A week or two since this gentleman, who had acted so disinterestedly and self-sacrificingly, was astounded by a Government demand for 350,000 francs as charges on the museum. He was informed subsequently that although he had enriched the State and deprived himself of his modest property, yet as there was no official acceptance of the gift he was responsible for the estimated expenses of the museum in the future as in the present. It is believed that steps are being taken to comply with the formalities of circumlocutionism, but at present M. RUPP appears indebted to the State to the extent of 14,000l.

VALUATIONS often give rise to litigation owing mainly to the difficulty of discovering who gave the first order for them. A case of the kind has just been heard at the Brighton County Court. The widow of the late CHARLES BACON sought to recover from Messrs. HARDY & CLARKE, solicitors, the sum of 26l. 5s. for the survey and valuation of the Dyke Hotel. Mr. HUBBARD, the owner of the premises, wished to raise 10,000l. on mortgage, and for that purpose a survey was made; then he wished to increase the amount to 12,500l., and it was necessary to go through the work again. The loan was not negotiated. Application was made to the owner of the property, who disclaimed liability and said that Mr. HARDY, the solicitor, had promised to pay for the survey, and it appears that on one occasion the solicitors had paid the fees. Different accounts were given about conversations on the subject, and eventually Judge MARTINEAU decided that Messrs. HARDY & CLARKE, who had employed Mr. BACON, were liable to the widow, while Mr. HUBBARD was liable to Messrs. HARDY & CLARKE. He would direct that Mr. HUBBARD should pay the amount claimed to Messrs. HARDY & CLARKE so that they should pay it to Mrs. BACON.

WHEN what is known as the Tarsney Act was passed in the United States, it was accepted as a triumph by civil architects. By its provisions the designing of public buildings was not confined to official architects. The Secretary of the Treasury was endowed with the power of calling in any architect in good practice for the preparation of the plans. The architect was to be aided by an officer known as superintendent, who was to be selected from a list of six men furnished to the architect by the Government. It has been found that although the superintendent is supposed to have no authority in directing the works, but is merely engaged for administrative purposes, yet he does not recognise that he is in any way responsible for the carrying out of his duties to the architect. He becomes an intermediary between the Government Department and the contractors and sub-contractors. The architect consequently finds that he has not the authority which is

believed essential in the case of a contract for ordinary works. He is allowed no voice in the selection of the contractors, and although he is responsible for having the work carried out in a proper manner, he cannot prevent the usual payments from being made according to the conditions of the contract. It was therefore proposed at the last convention of the American Institute of Architects that the Government should allow the architect to exercise as much authority over public buildings as he has been accustomed to do in his own practice. It is maintained that defective buildings arise less from faults in plans and specifications than from a builder's incompetency, and from the attempts he makes to carry out works in the least expensive manner in order to derive a larger amount of profit. It would be an advantage, of course, if the Government could adopt the suggestions of the architects, but as in the eyes of politicians, contractors, as they may exert influence over workmen who are voters, are of more importance than architects, a long time is likely to elapse before any improvement in the system is realised.

ONE of the old school of French artists who can still testify by his works that he is competent to paint important works is M. FÉLIX ZIEM. Fifty years have elapsed since he received a medal from the Salon. As far back as 1842 he was one of the artists who were invited to the Russian Court by NICHOLAS I. There, besides painting pictures, he gave lessons in art to some of the Russian princesses. The old painter was recently selected by the French Government to paint a picture of the meeting of the French and Italian fleets at Toulon, a work that is to be placed as a memorial of the event in the Ministry of Marine. M. ZIEM is not, however, exclusively a marine painter; he has produced works of other classes, and his name is honoured in Paris as one of the old representatives of ancient art who has been susceptible to modern influences.

EXPERIENCE has shown the difficulty of arranging a Lord Mayor's Show which shall not be suggestive of a procession of ill-trained supers from a circus. The pageants might be made interesting, but it would be necessary to arrange for their production in another manner to that which has long prevailed. This year it is hoped that ancient methods of weighing might have attraction for shopkeepers and those who deal with them. But to exemplify weighing it would be necessary to go back to a very early age. The Egyptians were masters of the process. In museums measures are to be found as well as objects with the weight inscribed on them, with cartouches of the monarch as a guarantee of accuracy. Weights were found in Pompeii, and as they were under the protection of MERCURY they may have differed from the standards and favoured the sellers. The sculptured representations of weighing souls in Mediaeval churches are proofs of the use of weights and scales. "Avoirdupois" originally signified goods which had been weighed, but from the time of HENRY VIII. it has been employed to designate a class of weight. The weight was used for groceries and foods, but it is doubtful whether the pound which is now established in England agreed with the old standard.

ILLUSTRATIONS.

WE publish this week illustrations of four of the designs submitted for the competition for the memorial of Queen VICTORIA. In our next number the fifth (Dr. ROWAND ANDERSON's) will appear. The descriptions of Sir THOMAS DREW's and Mr. JACKSON's design will be found on page 293-4.

THE NATIONAL MEMORIAL TO QUEEN VICTORIA.

DESIGN BY MR. ERNEST GEORGE.

DESIGN BY MR. T. G. JACKSON, R.A.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first meeting of the Institute for the session 1901-02 was held on Monday evening last, Mr. William Emerson, president, in the chair.

The decease of the following members was announced:—W. L. Sugden, of Leek, elected fellow in 1892; H. Y. Thomason, fellow in 1862, architect of the art gallery and municipal buildings of Birmingham; R. J. Bennett, of Manchester; H. R. Lloyd, elected associate 1887; J. Mackland, J. Littlewood and James Brooks, elected as fellow 1866.

The Hon. Secretary said they would all deplore the death of Mr. Brooks. He was a familiar figure at the Institute meetings. Mr. Brooks was one of the few survivors of the old school of Pugin, and he never swerved during his lifetime from the principles initiated in that school. In his work he proved himself to be an excellent church planner, the lines of his composition being marked by their simplicity. Mr. Brooks also possessed restraint, a quality to be observed in most of his works.

It was announced that Mr. Emerson had been made an honorary member of the American Institute of Architects.

The President acknowledged the honour conferred upon him by the American Institute. He said he considered that the American School of Architecture was doing good work. They encouraged, as many members of the profession in England did, a freedom for imagination in present-day architecture. The Americans understood the importance of restraint in all their works. They studied all styles in their best schools, and they were bringing up men thoroughly grounded in ancient work. In alluding to the number of recently deceased members, the President remarked that the Institute had benefited by the sum of 1,500*l.* bequeathed by the late Mr. Arthur Cates.

The Hon. Secretary said Mr. Cates under his will had presented the Institute with 215 volumes from his architectural library.

On the motion of Mr. John Slater, votes of thanks were passed to the Glasgow Institute of Architects, the Glasgow Corporation, Glasgow University, Glasgow Art Club, Imperial Union Club and the Royal Scottish Society of Painters in Water-Colours for their hospitality to the members of the Institute on the occasion of their visit to Glasgow and the Exhibition in the summer.

The Secretary said, as the result of a recent statutory examination, a certificate had been granted to Mr. C. O. Nelson, of Chiswick, to act as district surveyor in London.

The President's Address.

The President delivered his opening address. He said:—I had occasion, in my two former addresses from this chair, to take a retrospective view, in the one of the architecture of the past century, and in the second to consider what might be the state of our art during the coming century. This year I shall but glance at certain current points which seem to me either important or of interest. First, as to the increase of the numbers and influence of the Institute. Our numbers, I am happy to say, maintain a steady increase, and each year more candidates present themselves for examination than on previous occasions. We have, in fact, some 1,700 actual members of the Royal Institute of British Architects, or over 3,000 members counting those of Societies in alliance with us. There are also some 1,500 probationers and more than 400 students, which is some proof of the value set on the Institute examinations and the trend towards improvement in education of architects. I think this speaks very well for our increasing prosperity, so far as it can be told by figures. Unfortunately, though our numbers steadily increase, death has recently made dreadful inroads on our members, for since this time last year we have lost twenty-one Fellows and five Associates. It is sad to find that amongst this number have been some of the greatest and most honoured names. The roll includes Barry, Burnet, Brydon, Brooks, Cates and Young; and many of the number were carried off while in the prime of manhood and busy in harness—two of them just as they had achieved the honour of being appointed to design and carry out two of our greatest public buildings. Truly we must feel that in the midst of life we are in death. Their loss we all deeply deplore.

That the influence of the Institute is growing and not waning is shown by the number of instances in which it continues to be appealed to on architectural questions by public and other bodies, both in the Metropolis and provinces, and the number of congresses and other meetings to which we are asked to send representatives and invited to express our views. There can be no doubt that if the Institute would only let its voice be heard on important points in respect to architectural questions as they arise, whether they be metropolitan improvements or other important schemes, we should, and ought, gradually to become the guiding spirit in such matters.

While touching on this point of metropolitan improvements and large architectural questions, I suggested last year the

advisability of some more organised system of control over design. Whether it were by a Ministry of Fine Arts, as proposed by me, or by a Royal Commission, as has been suggested since both by the President of the Royal Academy and Lord Wemyss, is of little matter so long as the responsibility were fixed. The discussions and very varied opinions expressed in the *Times* and other journals on such a question by writers qualified or unqualified to judge seems proof of the evident necessity for some such organisation. In America, at Washington, the same suggestion is being urged on the Government. It has been stated that the widening of Piccadilly was only a part of a large improvement scheme for that particular approach to the City from Kensington, in which the taking down and rebuilding of Walsingham House would afford an opportunity for a move in that direction. Whether this is so I have no knowledge; but the question I would ask is, Why deal with only one small portion of London at a time? The whole question of the rebuilding of London, enormously difficult as it may be or the huge expense it may involve, ought now, without further delay, to be considered. Definite improvements and building lines should be laid down in all important directions, and all buildings pulled down and rebuilt or altered in the future should be obliged to conform to the scheme. It would mean increased expense to the ratepayers as each portion of ground was taken by the authorities for the widening or improvement of the thoroughfares; but it would be a gradual work, and, though slowly, London would at length be rebuilt on a properly considered plan, instead of an improvement here or a widening there being effected without relation to any well-considered inclusive scheme covering the whole problem. And I would reiterate what I said last year as to the necessity for providing subways to avoid the constant taking up of the roads. I am glad to see that five parishes have raised an indignant protest against the ever-recurring interruption to traffic by street excavations, and that the attention of the London County Council has been drawn to the matter. Since writing the above, I see in this morning's *Times* that the highways committee of the London County Council will submit at the next meeting of the Council a report advocating the construction of a system of shallow underground tramways in London, with subways for pipes, wires, &c., on each side of the tramway subway, and that the experiment should be initiated in the new thoroughfare in course of construction between Holborn and the Strand. This is a step on a most important matter quite in the right direction. The consideration of the questions of the insanitary effect of large areas overcrowded by a dense population in flats, the shutting out of sun and air, arcades over footpaths, railway works in the Metropolis, sites for workmen's dwellings, &c.—these are a few of the many questions entering into any scheme of improvement, as well as the embellishment of the Metropolis by its public buildings, and they should be dealt with by the ministry or commission to which I have referred. If we do not wish future generations to hold us up to scorn and blame us for our culpable apathy, it is time that Parliament took some step in the direction indicated.

I must again this year refer to the question of competitions. A great deal has been written of late in some of the journals on the subject of assessorships in competitions, and evidently without knowledge of the truth of the matter or troubling to ascertain it. The suggestion has been that the blame of the dissatisfaction so constantly arising as to awards lies at the door of the President or Council of the Institute for not having exercised sufficient care in the selection of assessors. I have therefore had a list made of the competitions held since July 1899 up to September last, with the assessors' names and the results—that is to say, as to whether there has been any expression of dissatisfaction in regard to their awards—and the following is what I find to be the case. There have been during this period, as far as I can find out, ninety-seven competitions held in all parts of the country and Metropolis. Out of this number there were seventy-three in which the authorities chose their own assessors, or, at any rate, did not apply to the Institute to name one. Out of these seventy-three the assessors' awards were set aside and dissatisfaction was expressed in twelve cases, or, practically, one in every six competitions. In the remaining twenty-four the President of the Royal Institute of British Architects, or the Council in a few instances, nominated the assessors, and in not a single instance was the award of these assessors set aside, nor can I find that any expression of dissatisfaction arose at their awards. There was only one case in these twenty-four where any unpleasantness at all arose, and that was solely on the part of one person out of sixty-two competitors for the same subject, because a certain alteration had been made in the conditions by the assessor, who was appointed a week or two after those conditions had been issued by the authorities. As it apparently made no difference to sixty-one out of sixty-two competitors, it could not have been of serious importance, and there was no dissatisfaction expressed at the assessor's award. I think this proves how ready some even of our own members are to blame

either the management or the officials of the Institute when they do not even know the facts about which they are writing or talking. A little more loyalty and real honest endeavour to serve the ends for which we are all supposed to be united and working would be more to the point, and assist materially the work of the Institute for the good of our art and the profession at large. And on this I must quote and adopt some words of Mr. Peabody's in his address to the American Institute:—"We can only measure the amount of good the Institute has done by its output. Many a man who cares little for it benefits because others have cared. Many a man outside of our numbers is more respected in his community and has a more certain livelihood because the Institute has proved itself a reasonable public body. Certainly, through its influence the perils and hardships of competitions have been greatly mitigated. But all these are small and selfish ends. The real value of the Institute lies in its opportunities, in its openings for useful work and mutual high endeavour. Thanks to the wisdom of its founders, I think it has been a potent means of good. Thanks to them, it has none of the features of a selfish trade union. In a trade union a man's powers and skill are handicapped for the general good, but with us a member has entered into no engagements of any kind except that he will honourably practise his profession." This examination of the result of the enormous number of competitions in a couple of years only is enough, I should think to deter most men in the profession from taking part in them; but if not—and we choose to have it so—we should bear in mind that in every competition the larger proportion of the competitors must naturally feel disappointed, as there can only be one winner, and if a man does not care to take this risk he should not compete. As I said last year, one can only endeavour to nominate the right man as assessor, but even he is hardly likely, however level-headed, careful and just in his perceptions he may be, to please everyone. Anyhow, if the public continue to lay the burden of competition on the profession, and we prefer to bear this burden of enforced gambling, then at least let us be fair amongst ourselves, and insist that nothing shall upset the principle we have long ago laid down—that when a duly qualified assessor has been appointed, and has selected a particular design, the author of that design shall, unless there be some very special reason to the contrary, be employed to carry out the work. Otherwise we are simply playing into the hands of an unscrupulous public, prepared to take every advantage of our time, talents and money. Even should the assessor happen to make an award that does not commend itself to all, it will certainly be better for the profession in the long run that the award be upheld than that each dissatisfied competitor should endeavour to upset it. Our only safeguard is loyalty to uphold this principle.

Our Congress last year gave rise to a most interesting discussion on bridge design, by the courtesy of the Civil Engineers, at their Institution. Whether it may bear fruit in the more intimate relations of the engineer and architect on the question of monumental bridges in the Metropolis and provincial towns remains to be seen. The architectural effect of bridges must be the outcome of the construction at the inception of the design, and can scarcely be added as a dressing afterwards with advantage. It can, therefore, only be satisfactorily accomplished if engineers and architects would be willing to consult with each other at the commencement of any such scheme. Unless this be done, as the aim of the engineer is necessarily and properly, from his point of view, to construct in a purely scientific manner, usually omitting all that would add unnecessary weight or cost, the more such a purely engineering scheme is developed the more hopelessly ugly it usually becomes. The only way out of the difficulty appears to be for architects to study the subject of engineering for such schemes themselves, and, when opportunity offers, put forward their own views. Certainly, progress in the beauty of monumental bridge treatment may be made, if the designer will only remember at the outset that every idea in the design should be suggested by the construction, and that any ornamentation added for mere caprice certainly defeats its own object, if that object be the mere adding of unnecessary features as ornament to an already logical construction. Such friendly discussions as these between kindred professions cannot do otherwise than help in the appreciation of architecture as appertaining to engineering, and clinching the theory that architecture and engineering should go hand in hand as helpmeets the one to the other.

In speaking last November, from this chair, of the problems that the architecture of this century is likely to have to solve, I mentioned as one the planning of large churches to meet the needs of modern congregations, with a view to avoid the blocking of the central portions of churches in the Mediæval manner of our Gothic cathedrals. I wish to-day to go a step further on this point, though I do so with some diffidence, because any suggestion of alteration in our accustomed church or cathedral arrangements is looked on by many as almost heretical; but what I may say is with a view possibly to induce at some later date a discussion on the point I am going to

raise, namely, that of bringing altars forward nearer to the congregations than is possible with the present arrangement of deep chancels and choirs. Such a discussion might be very interesting and instructive from the architectural side of church arrangement, as well as in relation to the question of congregational worship in our larger churches. In 1884 I wrote in one of the building journals some thoughts on church planning, the object of which was to show that the common fourteenth-century plan, with the crossing blocked by large piers and the enclosed choirs in the centre of the church though well adapted for the Mediæval and monastic times is quite unsuited to modern worship in the nineteenth century. This view now seems generally accepted; but further than this, the fervent spirit that has developed itself under the Church revival of late years renders it necessary that the large congregation should be able both to hear and see all parts of the services for full participation in them. Beresford Hope in his "Worship and Order" (written many years before his death, but still, I am assured, expressing his latest views, for he presented copies of this book to friends shortly before he died), says:—"I tell the man who wants to build a church, which shall be at once useful and beautiful, to forecast that church in his mind's eye, to forecast it at work—full of worshippers joining in the 'Te Deum,' upon their knees at the Holy Communion, of worshippers listening to the evening services. Let him guess, as he only can, by such a glance how everyone can hear and everyone can see. Let him notice where his light falls, and where it is darkness, and in particular let him make sure that the altar and its adjuncts stand well forward and are not lost in the obscurity of some unlucky shadow. There is no reason, beyond the prejudice which such a novelty might excite, why at times one should not construct a circular or polygonal nave. The nave of the Temple Church is precedent enough, and the glorious decagon of St. Gereon at Cologne would hold a goodly multitude. There are no more congregational naves anywhere than the octagon at Ely and the dome of St. Paul's." All which means that what is wanted now, and much more now than when the above words were written, is a large open space for worshippers, with the altar brought well forward, and not buried in the depths of a lengthy chancel or choir, as in the case of the fourteenth-century English cathedrals, of which type the new one at Truro is a modern representative, and, however good in its architecture, is simply an anachronism. Tradition and conservatism are well in their way, but should not go the length of hampering modern requirements with obsolete arrangements made for the benefit of colleges of monks, and not for the people. The desirability of a good open space for congregational purposes is now by most thoughtful minds generally conceded. The point I would suggest for reflection is the possibility and propriety of a further advance in increasing the facilities of large congregations for seeing and hearing, and participation in those parts of the services conducted at the altar, by an alteration in its position, which might, while being a step in advance towards meeting modern congregational wants, possibly also be found to be in a measure almost a return to early usage. In a modern cathedral, say, for argument's sake, the choir must contain stalls and seats for seventy to one hundred persons, with proper space for altar communicants and steps. The length would be at least 100 or 120 feet, and though this is considerably less than the depth of many Mediæval churches, it nevertheless removes the east end of the sanctuary so far from the nearest members of the congregation that it becomes practically impossible for them as a body to see or hear the services conducted at the altar. The question I ask is, conceded the open space in the centre of a large church, Why should we not consider the advisability in the future of altering the arrangement of our choirs and placing the altar at the entrance to the choir instead of at the east end, with the clergy, choir and bishop's throne behind the altar? To see if there is any reason in such a suggestion let us look back at some points in the history of church planning. The seats for the clergy being situated behind the altar is a far older arrangement than the position assigned to them in the Mediæval and monastic times. It existed at first in some of our own early cathedrals, as you all know—at Norwich and Canterbury, for instance. I believe I am right in stating that the view of the Anglican party in the Church is that their rules, doctrines and worship are intended to be in accordance with those of the earlier Church, and go back to the time before the bishops of Rome established the Roman Church as the chief of all the churches and arrogated to themselves the position of supreme head as Pope or Father. Now at this early period it is certain that the arrangements in the Christian churches provided for the altar being immediately in front of the congregation, and the seats for those who officiated at the various offices and at the altar being behind it. It is interesting to note how the earlier arrangements developed and were altered to meet the requirements of various times and peoples and changes of thought. Let us glance broadly at the various alterations that have occurred.

In the early basilican arrangement, as in old St. Peter's at Rome and St. Paul's without the walls, St. Apollinare at Ravenna, St. Clemente at Rome, both in the ancient and lower and the later or upper churches, and later also at St. Ambrosio at Milan, Sta Maria Maggiore at Rome, also at Torcello and Parenzo, and in the Armenian Church of Pitzounda, in the Coptic churches, and, as before mentioned, in Canterbury and Norwich, and also at the little Early church of Deerhurst, it was evidently thought desirable that no great distance should intervene between the congregation and the altar, and for this reason no doubt it was placed in front of the Bema, thus bringing it in close proximity to the worshippers. In those days the form of worship was comparatively simple, and the officiating clergy, who probably acted as cantores also, were seated behind the altar, their seats being ranged around the Bema, with the bishop's throne in the centre, and the worshippers evidently took full part as well as the clergy in the ceremony of Divine worship. These altars, it is true, faced the reverse way to ours, and the priest officiated standing behind the altar facing the people and the east. Now both priest and congregation in our churches usually face eastwards or towards Jerusalem, perhaps originated by Solomon's prayer at the dedication of the Temple, though other reasons are more usually given for the custom. Some few centuries later, when, in consequence of the holy mystery of the Divine sacrifice being more prominently suggested in the Church arrangements, indicated by the veiled altars, the ritual had extended and comprised more ceremonial, and more attention was paid to music, the addition of a chorus cantorum or choir was made, intervening between the altar and the congregation and jutting into the nave. The clergy still occupied the same position behind the altar during the missa and officium divinum, but subsequently those in holy orders, as well as the cantores, occupied the lower portion of the choir during the officium divinum, and those only actively engaged in the missa occupied the Bema. One evident reason of the choir being thus brought forward into the nave between the altar and the congregation in the basilican churches, as in the upper church of San Clemente and others, seems likely to have been, that had the increased number of singers been placed, like the priests, behind the altar, it would have necessitated in such a plan the position of the altar being moved some bays down the church towards the centre of the nave, by which arrangement many of the worshippers in the large aisles would have found themselves during the missa behind the altar and the officiating priest instead of in front. It seems to me there could have been no other logical reason for the departure from the first method of arrangement, which brought the altar in greater proximity to the congregation; and from this departure by gradual steps our Mediæval choirs were evolved, resulting eventually in the abbey churches in the entire shutting off of the altar, clergy, brotherhoods and choirs from the congregations by the elaborate screens even now remaining in many churches both here and abroad. The more exalted ritual with its greater suggestiveness of the importance of and reverence for the holy mysteries, aided by other Roman doctrines, seems to have led to the screening off of all those engaged in the service of the Church from the congregations by the veiling of the altars, as in the Coptic and Eastern churches by the iconostasis or solid screen which separated the altar from the choir, and also a further and more open screen which again separated the choir from the congregation. Instances of both these arrangements are found—of the first in the church of Abu Sargah and the old Coptic churches of Egypt at old Cairo, in Russia and Armenia; and of the second in the upper church of San Clemente at Rome and other early churches, and at Torcello; and possibly some such similar arrangement was adopted at old Canterbury and Norwich and the little ancient church of Deerhurst. Again, later on in Mediæval times, when civilised but Pagan Rome had fallen, and education for the masses had disappeared, the Church being the only light of the dark ages, and the bishops of Rome had added worldly pomp and power to the spiritual character of their office, and claimed for themselves the title of Pope as head or Father of the Universal Church, it was to be expected that the clergy and monastic orders should have conceived it necessary, considering the strong line of demarcation they had drawn between themselves, their elevated office and the ignorant laity, to emphasise this point in their churches by altogether enclosing for themselves and occupying the central and best part of the churches and cathedrals. This was the natural evolution of the first enclosed choirs in the basilicas placed between the altar and the congregation, and completed by the separation of the clergy and monastic bodies from the laity. This arrangement is familiar to us all in the numerous cathedrals with the enclosed choir or pulpitum. By this plan the congregations were debarred from any prominent or general joining with the clergy in Divine service or public worship, excepting in connection with the Mass or services held at the altar which it was then

found necessary to place in the nave, outside the choir or rood-screen, as was the case at Lincoln and York. These altars were for the popular services. There was a great screen between the western piers of the central tower, the altar in the middle, and doors on either side. A necessity for this altar for popular or congregational services is felt at the present time in some of our cathedrals, as at Norwich, in consequence of the enclosed choirs still remaining. In the early Mediæval times, that the congregations should unite with the clergy in public worship was, judging by the arrangements then existing, apparently considered of small moment. The people were to be impressed, or perhaps improved, from a spiritual point of view, but their worship was done for them, if I may so express it, by proxy, "as in the Jewish sacrificial rites, when the priests and Levites acted alone, but with this difference, that in this case the people could not even join in the prayers and praise, as did the Jews, for the reason that the Divine offices were not in the vernacular." It was when, later on, education, both religious and secular, caused an expansion of thought and feeling in the popular mind that an alteration was felt to be necessary, and it was the recognition on the part of the clergy for the necessity of the participation of the congregations in the whole of the services that caused the introduction of these second prominent nave altars in such proximity to the people that all could easily see and hear, and, at last, the holding of the services in the language of the people, as an additional aid to their heartily joining in them. This principle of two altars is sometimes considered not in accordance with the feeling of the English Church, which it has been said is one church, one altar; but it seems to have been the outcome, first, of the desire for the separation of the clergy and choir from the congregation, and, secondly, of the basilican churches having first arranged the choirs intervening between the altar and the congregation. If the basilican churches—which, after all, were first derived from courts of justice—had had, instead of the Bema, long chancels or choirs to accommodate a large number of cantores, like the late cathedrals, is it not possible that the same relative position of the altar near the congregation would have been maintained, and the chorus cantorum have been placed behind it with the clergy, instead of in front of it? The fact that later on the nave altars outside the choir were found necessary seems, to my mind, to argue that it would have been so. In Spain in the fifteenth century the arrangement obtained of the coro or choir being placed in the nave and the altar in the eastern part of the church, with the congregation intervening between the altar and the choir. A modified form of this principle of arrangement is now to be seen at Westminster Abbey, and this plan was no doubt also the outcome of the feeling for the necessity of the altar being not too far distant from the congregation. There are also many instances now in Italy of the choir being behind the altar, but in some of these cases the public are brought too near the altar, which seems somewhat derogatory to reverence, as in Sta Maria del Fiore at Florence, where the high altar was placed under the dome, and the congregation entirely surrounds it. At Sta Maria Maggiore the altar is still at the entrance of the Bema in the nave, and the choir and stalls for priests behind it on either side of a second altar at the end of the apse or Bema; and a somewhat similar arrangement exists in the semi-Romanesque churches of Cologne and St. Gereon, thus bringing the altars in proximity to the congregations. Does it not seem evident from these variations at different times of the arrangements made to suit the feelings and education of the ages that there can scarcely be said to be a hard and fast line drawn, or any grave law that would be broken if the present plan of accommodation of our tripartite arrangement of congregation, choir and sacrum were somewhat altered to meet modern requirements, however much in some respects our sentiment and conservative feeling make us averse to alterations? The present arrangement, when we consider the late earnest Anglican movement, which claims to go back in its faith and ritual to the period previous to the absolute sway and domination of the Roman Church, seems in some respects to be wanting and illogical, where, as in our larger churches and cathedrals, large choirs and numbers of clergy have to be accommodated, causing by this plan the altar to be removed from the congregation, say from 80 to 150 feet, and suggests the necessity for some revision in our plan which shall, as in the early times, bring the altar and the services conducted at it in closer proximity to the worshippers. I quite feel that difficulties arise which are not easy to surmount in the suggestion of the principal altar being placed at the entrance to the choir, but I do not see that they are insurmountable. First, there must be the elevation of the choir above the nave, and then of the sacrum and altar above the choir; but with a wide choir and a large open space in front, I do not see that this would be impossible any more than at Sta Maria Maggiore in Rome, or at the Duomo in Florence. Also there is the question of a great reedos, but a canopied altar and a dossal of beautiful workmanship and precious and rare

materials might be infinitely more satisfactory and in better taste than some of the large and elaborate altar-pieces of soft stone and inferior sculpture and workmanship that have been erected in many of our churches in late years. One objection, no doubt, that would be raised to such an arrangement would be, that by the present plan we are supposed by degrees to arrive at the holiest of all at the altar, which, therefore, is removed furthest from the vulgar; but the Roman Church has evidently not attached weight to this, and why should ours? A second altar might be placed at the extreme east end and used for smaller services, the bishop's throne and the choir and stalls remaining in the same relative positions as at present. With the enormous congregations our churches are now attracting, width of nave and choir and spacious interiors are a necessity, and with these, were it found advisable, this arrangement could, I imagine, be made to suit our worship as easily as the Roman Church has, in numbers of instances, made it suit theirs. As to its advisability in regard to sentiment and conservatism, no doubt many adverse arguments could be raised; but, all the same, the question would still remain of the vital necessity for fervent worshippers being able to see and hear and join in all parts of Divine worship. The subject has been in my mind for a number of years, which must be my excuse for bringing it before you on this occasion, and, after all, it is as much an architectural question as an ecclesiastical one. At any rate, I am not the first to have proposed such a thing, and numbers besides myself are interested in the subject. I would commend the point for consideration to any of you who may be likely to have the chance of erecting a large church or cathedral suited to modern times.

Gentlemen, this is the last time I shall have the honour of addressing you on the first day of a new session, and I can only conclude by once again saying how greatly I feel the honour you have conferred on me and the confidence you have reposed in me by again electing me as your President, and I assure you I shall continue, as I have ever endeavoured to the best of my ability, to do all I can to further the interests of our noble art, to extend the influence of this institution, and to uphold in the highest sense, as far as I am able, the dignity of our profession. To these ends the Council are ever ready to give their unqualified aid, and I only ask you all to loyally join with us in our endeavours.

On the motion of Mr. J. MACVICAR ANDERSON, seconded by Mr. G. H. FELLOWES-PRYNNE, a unanimous vote of thanks was passed to the President for his address.

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, W., Mr. W. H. Seth-Smith, president, in the chair.

A vote of thanks was passed to the Rotary Photographic Company for a donation of photographs of Rome for the Architectural School.

The President announced that there was a vacancy on the committee owing to Mr. A. T. Bolton's resignation prior to his appointment as master of the School. The committee have selected Mr. R. H. Weymouth to fill the vacancy, and he will be formally nominated at the next meeting.

The following were elected members of the Association:—Messrs. C. M. Edwards, E. F. Knight, W. H. Hillyer, H. Bailey, J. H. Gott, A. G. Parker, H. L. Samson, B. B. Hooper, W. J. Parker, J. H. Belfrage, C. J. Calder, J. C. Corblet, J. H. Crabtree, J. J. Crowe, jun., L. H. Harrington, A. J. Healey, D. S. Jennings, H. A. P. Pierce, L. Roberts, S. H. Stock, F. A. Stowell, T. J. Tatham, T. Thorne, G. F. Webb, H. D. Aubrey, A. B. Botterill, W. B. Sinclair, E. Chaplin, R. B. Curven, M. E. D. Dixon, J. V. Gibberd, Norman Hall, C. R. G. Harrison, C. McJarrow, H. Kemp, C. U. Kilner, D. M. O'Connor, A. E. S. Payne, P. Phipps, G. A. Potts, F. G. Russell, S. M. Spoor, E. G. Stevenson, R. W. Suttle, W. J. Tomlinson, W. I. Travers, C. F. Ward, R. H. Willson and B. H. Sutton.

Mr. ALEXANDER WOOD, F.S.A., read a paper entitled

Early and Mediæval Cambridge.

It has been said that Cambridge was, commercially speaking, never a very flourishing place. This appears to me over-hastily said. At Oxford the colleges have fairly strangled the town, or rather city, which in the early history was a commercial capital, and which one finds mentioned with London and Bristol. Cambridge has lost its commercial, but has retained its agricultural, consequence.

In the history and constitution of its Guilds we may read the record of its early unfulfilled promise. Guilds are of very early origin, and the English are the earliest. The Guilds were lay bodies, and existed for lay purposes. In the case of

the three Guilds in Cambridge given in the return (12 of Richard II.) one altogether excludes the clergy, another prescribes that they are to have no part in its management, whilst the third has a chaplain, but with the condition that if the funds run too low to maintain both a chaplain and the poor brethren, the chaplain shall be stopped.

Two Guilds—those of Corpus Christi and the Blessed Virgin—combined to found Corpus Christi College. The Guilds themselves united and bestowed much of their property in houses upon the college. This excited the people of Cambridge, who, in 1381, instigated by the Mayor, and led by a certain James of Granchester, a local Wat Tyler, plundered and destroyed the house of a University official, the Esquire Bedell, whence they hurried to Corpus Christi, broke open the college gates, assaulted the master and fellows, and seized upon the college charters and plate. They next went to the house of the Chancellor of the University, whom they constrained to subscribe two bonds, subjecting the University to the town, and engaging the University not to prosecute the town on account of these violent proceedings. The mob, after burning the University charters in the market-place, assailed Barnwell Priory and the nunnery of St Rhadegunde, both of which had large possessions in the town, and the riot was only put down by the arrival of the Bishop of Norwich with an armed force. Dr. Keys relates in his history that after the burning of the University charters an old woman, Margaret Sterr, threw ashes—I suppose those of the charters—into the air, and shouted, "Thus let the learning of all scholars be confounded."

This amiable lady appears to have possessed an exuberance of civic life, and there is this to be said for her, that throughout the whole Middle Ages the colleges were thrusting themselves into and absorbing the most important region of the town, that adjoining the river, and were unpopular in consequence.

There were till lately several old houses in Cambridge, particularly in Bridge, Trinity Street, formerly the High Street, and the neighbourhood of the Petty Curry. The Jewry was in the parish of St. Sepulchre's, and occupied a large part of All Saints parish, including the site of St. John's College. The Synagogue and the house of Benjamin the Jew (afterwards converted into the Tolbooth) were not in the Jewry but in the market-place, near the present Guildhall. Some have thought that the Jews did not live in the Jewry, but that is a mistake. As a matter of fact, they constructed numerous stone houses in and about the Jewry at a time when the majority of houses were constructed of wood.

The presence of Jews in a town in such numbers as to have a special quarter assigned them is an evidence of its commercial importance.

I have referred to the Cambridge Guilds at an early date. At that time their ordinances were full and original. It is probably an evidence of the commercial decline of Cambridge that a very singular change took place in the fifteenth century. Nowhere else in England did, as in Cambridge, one Guild after another simply copy out the ordinances of an older Guild. Ordinances professing to be those of distinct Guilds, with more than forty years between them in the dates of their foundation, "are more identical in shape and words, so far as these could be used by separate bodies, than are the different versions of what are avowedly copies of the same by-laws."

The Cambridge charters have been published in the course of the present year under the editorship of Mr. F. W. Maitland and Miss Mary Bateson.

The churches of Cambridge would take a volume in themselves. To make the study of them intelligent one has to make a circuit of several miles round Cambridge, and even further than that at individual points, to trace their similarity to other churches in the same district. Thus what I have seen described as the singular tracery and form of the windows at St Michael's, Cambridge, proves not to be singular when compared with that at Over, some miles to the north-west of Cambridge, which appears to be by the same architect or band of workmen.

I shall omit all notice of the most remarkable church in Cambridge, St. Sepulchre's in the Jewry, as that is well known and has been fully described as one of the round churches of England. I shall speak of those only which were connected with the colleges, and in doing so I shall take them in chronological order, as they existed in and were part of the town before the colleges were built.

The oldest church in Cambridge and the oldest building in the town is St. Benedict's, or St. Bennet's Church. Its situation is slightly to the west of the site of the Austin Friars, and immediately adjacent to Corpus Christi College. The body of the church was restored by Mr. R. Brandon, and exhibits few traces of its remote antiquity. The tower, however, remains intact. It is of that version of Early Romanesque which we commonly call Saxon. It is in diminishing stages, not in one upright mass, as the tower of St. Michael's, Oxford. The material is rough masonry, the quoins being in "long-and-short" work. Of the three stages of which the tower is composed, the lowest occupies nearly half of the entire height. The divisions are made by plain projecting string-courses. In

in the midst of each face of the belfry stage is a window divided by a central baluster standing in the midst of the thickness of the wall, and supporting an abacus extending completely across the wall and bearing two semicircular window-heads consisting of a single stone. There are smaller windows in each face set laterally to the larger ones, but on a higher level. The baluster shafts of the central windows are ornamented with a band of rudely-carved rings. The crowning member is a plain coping.

The tower of St. Bennet's communicates with the nave by a massive semicircular arch having capitals adorned with highly-carved representations of animals. Of the church contemporary with the tower only a few fragments remain built into the existing walls.

The nave is of the thirteenth century.

The original approach for the parishioners was by a porch, no longer existing, at the west end of the south aisle.

The south aisle of the chancel is formed by a building that in Mediaeval times consisted of an upper and lower chapel, the lower of which was used as a lecture-room. In the north wall is a window commanding a view of the parochial chancel. This building, deprived of many interesting features, is still connected with Corpus Christi College by a gallery supported by a four-centred archway.

The advowson of St. Bennet's was purchased by the monks of Corpus in 1350, and the royal license for the appropriation was obtained in 1352, but was not acted upon until a very late date. The college was in the parishes of St. Bennet and St. Botolph, one standing at one and the other at the other extremity of the site. The statutes of the college required its members to attend service daily in one or other of the churches.

A trace of the former connection with the college is the monument in St. Bennet's of Richard de Billingford, Master of Corpus in 1398, who died in 1432.

Much the finest example of First Pointed in Cambridge is that at is now, and has been since the early part of the sixteenth century, the chapel of Jesus College, formerly that of the priory of St. Rhadegunde. It was erected between the years 1230 and 1245, the north transept being the oldest portion of the existing building. It was originally in the form of a cross, with a tower in the centre, and had, in addition to the transepts, aisles on the north and south sides of the eastern limb, flanking along half the extent of its walls and forming chapels, which opened into the chancel by two pier arches in each wall. Of peculiar beauty are the piscina and sedilia; the series of octagonal windows, with blind arcading between them, in the chancel, and the roof-storey gallery on the inner side of the nave walls. The piscina was thought so beautiful that it was copied in the parish church of Histon, to the north of Cambridge, and in the ancient Hospital of St. John, where St. John's College now stands.

The nave had seven piers on either side between it and the aisles. These piers were alternately cylindrical and octagonal.

Upon this splendid fabric Bishop Alcock of Ely brought about as little else than ruin in transforming it into a college chapel. A considerable amount of his work has been undone in our own day, and there appears to be no reason beyond the sense that would be incurred to prevent the whole being brought back to its primitive condition.

The Cambridge example of the Second Pointed style is the church of St. Mary-the-Less without Trumpington Gates, attributed to Alan of Walsingham, remarkable for its window tracery, and particularly for that of its east window, in which one sees an approach to the Flamboyant character. The first church on this site was in the Norman style, and was known as St. Peter's without Trumpington Gates to distinguish it from St. Peter's by the Castle. The college was named St. Peter's in this church.

This church fell down about 1350. The actual church of St. Mary was built as Merton chapel or church in Oxford to serve both for the college and the parish. It is a lofty body without aisles or any structural division between nave and chancel. The separation was effected by a screen. The length is 100 feet and the width 27 feet. The church is divided into six bays, each of which, except the westernmost, is a double bay in plan. It is lighted by lofty windows having between them deep buttresses. The tracery of the windows on the north side is all modern, with the exception of that in the westernmost window. In the eastern gable and in that on the north side are windows, the tracery of which is exceptionally rich and flowing. The tracery is in the same style and even in the same patterns as that of the same date in Ely Cathedral. In the fourth bay are traces of chantries both on the north and south, opening from the chapel by doorways and decorated with rich complex foliation which formerly overhung the monuments placed upon the line of the foundation of the wall. At the east end of the church is a vestry in two storeys attached against the south wall of the easternmost bay, whilst against the next bay is an apartment or vestibule, entered from

the south side of the choir. An ancient stone staircase leads from this vestibule to the gallery communicating with the college, so that the members of the community could use this as a private entrance. The floor of the vestry is raised upon a vault, which was used as an ossuary, or charnel-house. The gallery connecting with the church is of the middle of the fourteenth century, at which date the choir was refitted. The new quadrangle of Peterhouse was built at the same time.

At St. Edward's Church the aisles to the north and south of the chancel belonged, that on the north to Trinity Hall, and that on the south to Clare College.

The south aisle of St. Michael's Church served anciently as the chapel of Michael House, one of the collegiate establishments on the site of Trinity College. The north aisle was the chapel of Gonville Hall. In this church was buried Hervey de Stanton, minister of Edward III. in 1337 and founder of Michael House.

St. Mary-the-Great is the university church. It has a lofty nave with span aisles and lighted by twenty windows in the clerestory.

One might be tempted to think on entering a college that the chapel was the most important building, the first built, and that all the other buildings had clustered round it. That is not the historical fact. The least ambitious part, the chambers, comes first. Originally chambers were lodgings in private houses, such as the accommodation—if such it can be called—for students in London or in the Scottish university towns. Next, larger or smaller bodies of students came to be entertained by a host, who furnished a common table, to the cost of which, however, each student contributed his own expenses. So we have hostels or inns. Some hostels were of sufficient importance to have parts of the parish churches appropriated to them. Then colleges came to build their own chapels, of which arrangement Pembroke is the earliest example in Cambridge. The chamber, the hall, the chapel, such was the progressive development. Eventually, with the exception of St. Mary's, the parish church ceased to enter into university life.

So also have monastic establishments. During the Middle Ages there were many monastic houses in Cambridge. The monks of Ely had one hostel, those of Croyland another, those of Norwich a third. Of the friars the Franciscans established themselves at Cambridge as early as 1224, in 1249 the Carmelites moved in from Chesterton to Newnham, in 1257 the friars of the Order of Bethlehem settled in Trumpington Street, and in 1258 the friars of Penitence settled in the parish of St. Mary-the-Great, whence they afterwards removed to the parish of St. Peter's, where their buildings were eventually absorbed by Peterhouse. There were added to these at a rather later date (1273) the friars of St. Mary, and two years afterwards the Dominicans. The Austin Canons had been for two centuries and a half established at Barnwell Priory, and the brethren of St. John's Hospital—also under the rule of St. Augustine—were established in 1135 by Henry Frost, a burgess of Cambridge.

Two Cambridge colleges, which fall without the Mediaeval period, Sidney-Sussex and Emmanuel, are built, the former on the site of the Franciscan or Grey Friars' house, Emmanuel on that of the Dominicans or Black Friars. The Carmelite house was situated between King's and Queen's Colleges; the Austin Friars near the site of the new museums; the White Friars of the Order of Bethlehem on the site of Addenbroke's Hospital.

The alleged history of the town and University of Cambridge in their early days is an impossible fable, and the account attributed to Peter of Blois, archdeacon of Bath, is not history. Universities grew up from the episcopal and monastic schools. Something was wanted of wider range than their comparatively contracted teaching, and what became universities sprang up by the efforts of capable and enterprising teachers at suitable spots. Separate schools or colleges came in time to supplement the universities and to impart a more familiar and methodised instruction. This process was followed everywhere in Western Europe, except, indeed, in Scotland, where the students do not reside in colleges.

The word university is simply a Mediaeval law term for a corporation. When academical corporations were founded at Paris and Bologna they gradually absorbed into themselves the use of the word university, which had hitherto been common. The School of Bologna was called the University of Scholars, that of Paris the University of Masters, because in the one the students enrolled themselves into a corporation, and in the other the masters obtained for themselves corporate rights.

A college means properly a number of persons incorporated as colleagues for certain common purposes; the building is the house (*domus*) and hall (*aula*) and hostel (*hospitium*).

The only buildings required by a university as such were a place to hold meetings and ceremonies, a library, lecture and examination-rooms.

We know the appearance of the Cambridge schools in the middle of the fifteenth century. On the north side of the

Quadrangle stood the Theology School, and on the west was that of Canon Law, with the new library above it. To these on the south side were added the Schools of Philosophy and Civil Law. The whole building appears to have been completed in 1470 or 1471. The south building was entered by a vice or turret staircase at the north-east corner, known as the schools' tower and as the schools' belfry from containing the schools' bell. It formed part of the east range containing the gateway—still preserved at Madingley, near Cambridge—which was begun in 1470. The east building occupied the space between the staircase and the Theology School. The entrance gateway had above its archway shields bearing the arms of England supported by lions, and those of Archbishop Rotherham of York. On the side towards the Quadrangle were seen the arms of Edward IV. and of Richard III.

These schools were the outfit of the Mediæval University of Cambridge. They were confined to a single building. The colleges, on the other hand, were numerous. Still, they had a common character, so that we say now of a building that it is or looks like a college.

It has been argued that the dispositions of a monastery were derived from those of a Roman villa, and in particular from those that partook both of the character of the town and country house, and this resemblance has been worked out in detail. The cloister, with its pillars surrounding an open court having apartments opening from it, is, it has been argued, clearly derived from the peristyle common to the Roman town house and the country mansion, which was the part of the house reserved for private use. The outer court, with its stables, granaries, &c., corresponds with the villa rustica of the Roman country house. The tablinum becomes the chapter-house. The kitchen and refectory are in both cases situated on the outer side of the court. It is easy to press the analogy too far, but there is an evident truth in it.

So it may be said that there is between the general plan and disposition of a college an analogy with that of a monastery. The general enclosure within walls, the disposition into courts surrounded with buildings, the cloister, the refectory with its attendant kitchen and offices, the chapel (where it existed), the master's lodge corresponding to the dwelling of the abbot or prior, were similar to parts of the monastic structures or those occupied by the secular canons. The common dormitory, however, was a feature not reproduced, as the members of colleges slept in rooms or chambers, and were chamberers or chums. In Cambridge the chapel, the library, the master's lodge, and the great gateways of the later were wholly wanting in the earlier colleges. Even the disposition in a square or quadrangle was not at first attempted. The founder would purchase land and houses and accommodate them to the use of his college.

The colleges which fall within the Mediæval period are fourteen in number.

1. St. Peter's, the earliest of the Cambridge colleges, was founded by Hugh de Balsham, bishop of Ely, in 1284. He transferred to certain hostels on this site scholars whom he had previously placed in St. John's Hospital. He bequeathed funds which enabled his scholars to purchase land to the south of St. Peter's Church (now Little St. Mary's) and built upon it a handsome hall. The quadrangle was not begun until 1424. The buildings were then carried on continuously until about 1466. The north, west and south sides were successively undertaken. The east side was still occupied by the original hostels.

2. Clare College was founded in 1326 by Dr. Richard Badew, chancellor of the University, and was originally known as University Hall. The college was founded anew by Elizabeth de Burgo, third sister and co-heiress of Gilbert de Clare, Earl of Gloucester and Hereford. This college does not appear to have been arranged upon the quadrangular plan until subsequently to the Mediæval period. It is now wholly Renaissance, and the best specimen of that style in Cambridge.

3. Pembroke College is one of the four colleges founded in the middle of the reign of Edward III. It was founded by Mary de St. Pol, second wife of Aymer de Valence, Earl of Pembroke. The Earl died suddenly in France in 1324, when his widow became foundress of Denny Abbey, between Cambridge and Ely, and in Cambridge of a house of scholars with the name of the college or hall of Valence-Mary, by way of jointly commemorating her husband and herself. The south side of the quadrangle was begun in the lifetime of the foundress, and the construction of the chapel—the first college chapel in Cambridge—was authorised by a Papal bull in 1355. The Countess had originally chosen another site for her college, and St. Botolph's Church was to have served as chapel. The very diminutive court at Pembroke is, with the exception of the building on the south side, of later date than 1351, when the site for it was obtained. Henry VI., in his charter, calls this "the most noble, renowned and precious college, which, among all others in the University, was ever wonderfully resplendent."

4. Gonville Hall was originally erected on another site and

transferred to the present by William Bateman, bishop of Norwich. The chapel, occupying part of the south side, built in 1393; the chambers that complete that side and the west side in 1441; the east side was not built until 1471. The chapel was built with its east end free, no building abutting upon it.

5. Trinity Hall has the peculiarity of an entrance court interposed between the quadrangle and the street, like the curia of a monastery. The quadrangle is larger than in previous college—115 feet long and 80 feet wide. The founder, Bishop Bateman, is believed to have built the hall and range next the street. The rest of the west range and north range were added in 1374. The chapel is believed to have been built in the fifteenth century. Trinity Hall was a house of study for the monastery of Ely prior to its conversion into a college for the study of civil law.

6. Corpus Christi College, built between 1352 and 1360, exhibits the first regularly planned close quadrangle, as it is a hall range on the south, containing the hall, kitchen, master's lodge, and of chambers upon the other three sides. The buildings are low and of equal height throughout. There was no chapel, but, as I have stated above, two parish churches, to either of which the students could resort.

7. The first stone of the old court of King's College was laid in 1441. The area was so cramped that the formation of a regular quadrangle could not be attempted. The first stone of the chapel for the enlarged foundation was laid in 1471. The design for the enlarged college was never executed, the large southern quadrangle has sprung up in quite modern times. A closed quadrangle was contemplated, of which the chapel would have formed the north side; the west side would have been occupied by the library, the hall and the provost's lodge; the south and east sides by chambers. Westward of the chapel would have been a cloister, like Wykeham's at Winchester and New College, Oxford, with a lofty detached campanile.

King's College was founded by King Henry VI. in 1441, with a rector and twelve scholars. Two years later the king's plan was greatly extended and the endowment was made for a provost and seventy scholars. The college was not completed until the reign of Henry VII., although the Lancastrian kings of the Yorkist kings contributed to this Lancastrian foundation by Henry VII.

8. Queen's College was founded by Margaret of Anjou, wife of King Henry VI., in 1448, for a president and four fellows. The annual revenues amounted to 200*l.* a year, a sum of much greater purchasing value then than now. The principal quadrangle was completely designed and finished in a few years. It is entered on the east side, which, as also the south, is occupied by chambers. The hall, kitchen and buttery are on the west side, whilst the original chapel and the library were to the north.

The first stone of the chapel was laid for the Queen by Sir John Wenlock, who was afterwards slain at Tewkesbury, who caused to be engraved upon it (in Latin) the inscription: "The Lord will be a refuge to our Lady Queen Margaret, this stone for token," a prophecy ill-fulfilled by the event. The building of the college was interrupted by the Civil Wars; the president, Andrew Duckett, was successful in obtaining for it the patronage of Elizabeth Wydeville, queen of Edward IV. The number of fellows was raised to nineteen, and as many as forty-five scholarships were founded. The endowments were much increased by Richard III. and other benefactors.

Soon after the erection of the great quadrangle a large range of buildings was erected to the west, with, what is an exceptional feature for Cambridge, a cloister-walk on the ground floor. The arches are plain four-centred arches of brickwork, of three chamfered orders.

9. Catherine Hall was founded in 1473 by Robert Wenlock, Doctor of Divinity, provost of King's College, and chancellor of the University, who dedicated it to St. Catherine and appointed a Master and two Fellows and some Fellow-commoners. The buildings formed a quadrangle. The library and master's lodge were on the north side, and the chapel on the south, projecting eastward beyond the east range of chambers. This college was wholly rebuilt in the seventeenth and eighteenth centuries.

10. Jesus College was made into its present form from a pre-existing nunnery of St. Rhadegunde about 1495. The nunnery was endowed by Malcolm IV., king of Scotland, who was also Earl of Huntingdon. It was dissolved at the petition of John Alcock, bishop of Ely, and Lord Chancellor of England. Alcock's foundation was for a Master, six Fellows and six scholars. I have already treated of the conversion of the nunnery into a college.

The distinctive features of this college are the cloister surrounding the original quadrangle inherited from the nunnery, the entrance court, and the road leading to the entrance gateway and running between the walls of the master's and fellows' garden. The cloistered quadrangle was universal in monasteries, but not to be found in colleges.

cept in their secondary courts. In ecclesiastical buildings the Vicars' Close at Wells presents a near analogy to the ordinary college quadrangle.

11. Christ's College was built on the site of a hostel called St. Mary's House, which had been originally settled near Clare College, and endowed in 1442 by William Bingham, rector of St. John Zachary, London, but removed to this site to make room for the building of King's College. Margaret, Countess of Richmond and Derby, obtained a license from her son, Henry VII., to complete the college, gave it a body of statues, and lived to see the quadrangle completed.

The entrance gateway is to the west; on the opposite or eastern side are the master's lodge and the hall, having at its south end the butteries, and beyond them the kitchen, external to the quadrangle. The chapel occupies part of the north side, and extends beyond the eastern range of buildings. The remainder of the north side, the whole of the south side, and the greater part of the west is occupied by chambers. The library is on the first floor, on the west side, to the south of the gateway. The buildings have been much transformed externally, but the ancient structure remains.

Tradition says that Lady Margaret of Richmond was influenced by Bishop Fisher of Rochester in the interest she took in Christ's College. The exercise of that influence is much more certain in the foundation of St. John's. Dr. Fisher was master of Michael House, in the immediate vicinity of the Hospital of St. John the Baptist. It had fallen into decay and disrepute about the time when Fisher became chaplain to Lady Margaret. She had endowed Christ's College with the Abbey of St. Mary of the Meadows, at Ely, in Norfolk, and she now concurred with Fisher in his desire to devote the Hospital of St. John to educational purposes. Her death took place June 29, 1509, and the college was not begun until two years later. The building of the first court was carried on without interruption until completion. The college was opened by Bishop Fisher, July 29, 1516. One of the buildings of the hospital was altered to a chapel for the college, and formed such part of the north side of the quadrangle as was not occupied by the master's lodge. The lodge had an oriel resembling the bayed windows to be found in the churches and chapels of the period. It gave the master a view of every part of the quadrangle. The west side comprised the hall, buttery and kitchen. On the south was a range of chambers. On the east side was the library, with chambers beneath it. The second court is entered through the screens of the hall. There is nothing unusual in a passage given in at both ends in this position. It was probably seen from the first that the college would extend in this direction. The entrance gateway is of the type of which that at Queen's is the best example. It is of red brick, with angle turrets, having on each side two quoins. There is an ogee canopy over the gate. The central shield, with the arms of England and France quarterly, supported by the Beaufort antelopes. In the tympanum beneath is a rose. To the right (heraldically) is a large rose, to the left (heraldically) a portcullis. Both are crowned. The special emblem of the Lady Margaret, are sown throughout the whole space beneath the string-course. The arms were formerly emblazoned in gold and colours, whilst the antelopes were gilt. Resting upon the finial of the arch is a niche with a figure of St. John, beneath the usual oriel canopy.

Of this noble gateway that at Trinity College may be considered a more homely version. There the entrances are suitable, one for carriages the other for foot passengers. These have always reminded me of the tale of Sir Isaac Newton, that he cut two holes in his door, a big one for the cat and a small one for the kitten.

13. Trinity College sprang up from a variety of hostels, none of which are there now any but the most fragmentary remains. The history of this noble college itself falls without a period.

14. Magdalene College stands apart in more senses than one. It occupies the site of an ancient Benedictine establishment, dating from 1428. Different religious houses built different portions. Ely built one chamber, Walden a second, Ramsey a third. The general name of this composite fabric is the "Monks' Hostel." After the Dissolution the building was carried on in succession by the Duke of Buckingham, Lord Dole of Walden and the Duke of Norfolk. The buildings, with the exception of the Pepysian Library, were completed before the end of the sixteenth century. In the quadrangle of Magdalene is to be observed the corner staircase turret, a feature of Cambridge but not of Oxford colleges. The entrance gateway is unaccompanied by a tower.

The hall, butteries and kitchen occupy the east side, the library being at the north end and the kitchen extending to the external south boundary of the buildings. On the north side is the chapel next the hall; the remainder was formerly occupied by the master's lodge.

The south and west sides consist of chambers.

Magdalene College is at the foot of the Castle Hill of

Cambridge, and I now end where I began, in Horace's phrase, "The close of a long journey and a long paper."

Mr. BUTLER WILSON, who proposed a vote of thanks to Mr. Wood for his exhaustive paper, said the history of Cambridge was too long to encompass in a one evening lecture. The account the lecturer had given them proved him to possess a thorough knowledge of the locality. Such a study as the history of collegiate buildings tended towards antiquarianism, and students of architecture were perhaps supposed to take more interest in other work, which came before them in everyday practice. If an acquaintance with the buildings of Cambridge stimulated the student to work in the same spirit and to show such good results as their Mediaeval predecessors, then antiquarian study should be encouraged.

Mr. FRANCIS HOOPER, in seconding the vote, said the antiquarian part of the paper should be appreciated by architects. There were few subjects which the architect should be foreign to, and it seemed almost necessary for him to have some antiquarian knowledge. The speaker said it was very pleasing to find that the two great university towns had been so little modernised, and that to-day the student could see existing examples of sixteenth-century work when English architecture was as virile as it ever had been.

Mr. H. CAVLEY, M.A., supported the vote, which was passed with acclamation.

LIVERPOOL CATHEDRAL.

A MEETING of the Liverpool Cathedral committee was held on Monday, Mr. Robert Gladstone presiding. The report of the organisation committee was considered, and the following recommendations were unanimously adopted as likely to provide the basis of much useful work in the future:—

1. (a) The organisation of the diocese should as far as practicable be arranged on rural-dean lines, and with this object in view it is thought that the rural deans of the diocese should be added to the organisation committee as ex-officio members, together with one leading layman from each deanery, to be nominated by the rural dean. (b) In the case of the large towns of the diocese, such as Bootle, Southport, St. Helens, Warrington, Widnes and Wigan, a special organisation for the town should, if practicable, be formed and worked separately on its own lines.

2. The rural deans of the diocese should be requested to invite the clergy of every parish, even the poorest, to nominate an hon. treasurer, who may be either gentleman or lady, whose duties should be:—(1) To receive, and where possible to solicit, subscriptions to the Cathedral Building Fund, with the assurance that even the smallest amounts will be most gladly received, and on the understanding that the payment of all subscriptions may if so desired be spread over any period up to five years. (2) To arrange, where such may be possible, for, say, quarterly or at least half-yearly collections from men's services, adult Bible classes, mothers' meetings, children's services, Bands of Hope, Sunday schools—including both teachers and scholars—and mission-rooms. (Here it may be noted that it is felt that the time has not as yet come when as a rule special collections in the various parish churches of the diocese can wisely be asked for. The collections contemplated in this paragraph do not therefore refer to these.) (3) To distribute collecting boxes (to be provided by the organisation committee) where such may be desired, and to be responsible for the ingathering of funds collected in this way.

3. In most of the larger towns, especially, of course, in Liverpool, there are highly organised and powerful business associations, both mercantile, trade and labour. It is strongly felt that, so far as opportunity may be devised, every endeavour possible should be made to enlist the organised help of these associations with a view to the collection of subscriptions from their members.

4. The committee recommend that an organisation secretary be forthwith appointed at a stipend of 200*l.* per annum, with travelling expenses (second class) and such necessary printing and postages as may be rightly incurred. Three months' notice on either side to terminate the engagement. The duties of such secretary to be:—(a) To keep the ideal of the cathedral ever before the diocese in the highest possible way and on the highest possible level, as a great spiritual work to be undertaken and carried through for the glory of God and for the welfare of His Church in our midst. (b) The organisation of the diocese in consultation with the rural deans and the parochial clergy under the direction of the organisation committee. (c) The oversight and encouragement of all hon. treasurers, whether connected with the parishes of the diocese or with the associations referred to in clause 3 above. (d) To suggest, even at this early stage, the great desirability of contemplating or initiating votive offerings to the cathedral of every kind, whether by individuals, by parishes or by other special organisations.

(e) The creation of a strong public opinion by means of private influence, by sermons, by lectures with or without the lantern, and by speeches both by himself and by others working with him. (f) To further the good cause by every possible means that may be suggested or devised. (g) When not engaged on Sundays in preaching on behalf of the Cathedral Fund, the organisation secretary will be expected to do duty as a diocesan chaplain, such duty to include (a) taking services and preaching at the request of the Lord Bishop in any parish of the diocese as need may require—any fees received for such services being paid to the Cathedral Fund; and (b) preaching occasionally for the various diocesan societies as opportunity may be afforded.

The committee further recommend the appointment to this important post of the Rev. Charles Harris, M.A., senior curate of St. Helens, and since 1893 lecturer to the Palestine Exploration Fund (late Gunsley Exhibitioner of University College, Oxford, 1879, honours in natural science, 1882, formerly assistant master at Merchant Taylors' School, Great Crosby, and curate of Milton-next-Sittingbourne, St. Lawrence, Isle of Thanet, and Appledore). Mr. Harris to enter upon his duties at the commencement of December 1901.

5. The committee propose to address a letter to the rural deans enclosing a copy of the foregoing resolutions, if finally approved by the executive committee, heartily inviting their co-operation as above suggested, informing them of the appointment of the organisation secretary, and offering them his services and the services of other members of the organisation committee as a deputation to address meetings in any part of their deanery where such may be found practicable.

EDINBURGH ARCHITECTURAL ASSOCIATION.

FOR some time past there have been in Edinburgh two societies of architects, one of them—called the Association—being largely composed of older members of the profession, and the other—the Society—consisting of the younger class. They have this winter joined hands, and an auspicious beginning was made on Monday evening, when a handsome suite of rooms was formally opened by Sir George Reid, president of the Royal Scottish Academy. The rooms are situated at 117 George Street, and they have been prettily decorated and furnished by the members. Mr. Henry F. Kerr, president of the Association, presided over the “house-warming,” at which there was present a large number of ladies and gentlemen, and he expressed the hope that the advancement of their art would always be in the forefront of their institution. He hoped also that there would be no more hieing off of the young shoots, but that the Edinburgh Architectural Association would serve the interests of both the older and junior members of the architectural profession in all time coming. Sir George Reid wished the Association many prosperous and happy days in its new home. Bailie W. S. Brown also conveyed the good wishes of the Corporation. He knew architects had been saying that the Corporation of Edinburgh had not been doing very much by way of open competition to assist especially the younger members of the profession. He was divulging no secret when he said there was a growing feeling in the Town Council—and it was one of the points that would have to be considered at an early date in connection with a vacancy in one of their departments—that Edinburgh should follow what had been done with so much success in Glasgow and elsewhere in throwing municipal work open to competition. Professor Baldwin Brown also spoke.

Broad Street Place.

SIR,—May I inquire your authority for the suggestions in par. 3 and the statements in pars. 4 and 5 of your description of above? If I am right in my history, the site of the St. Mary's Catholic chapel mentioned was part of the large marsh fen or pond comprising the area of Old Bedlam at the south-west corner of London Wall to the site of the Ophthalmic Hospital, and had until 1817-20 never been built upon. That the whole space was the resort of the public of the locality as an open space in fine weather, and in winter time a skating ground frequented by the roughs of Long Alley and the Bishopsgate slums, was common knowledge. When the Corporation of London, or the Bridge House Committee, set about building Finsbury Circus the Roman Catholics, whose chapel was then in White Street, Little Moorfields, south side, obtained leave of the Corporation, after arranging with others who had rights of pre-emption, to take the site on

which the church of St. Mary's and the clergy house was built. If I am right the Corporation was the vendor and not the Fishmongers' Company, whose interest in the site or a portion of the great marsh I do not remember to have previously heard of. The chapel plundered in the Gordon riots was believed to be that in White Street. It could not have been on the marsh, where none existed. When Whitecross Street Prison was built, the owners of the sites were offered rights of pre-emption on the marsh. Possibly the Fishmongers' Company was one of the number who declined their pre-emption, and gave way for the Roman Catholics. The chapel is not in Ropemaker Street, a street parallel with White Street, but Eldon Street, the northern boundary of the old marsh, less than 200 yards from the site of St. Mary's Chapel.

Some of your Colonial subscribers, whose knowledge may be greater than mine, would regret, I am sure, you should unintentionally fall into error of history on the subject of St. Mary's.—Yours obediently,

J. FUNSTON.
November 5, 1901.

GENERAL.

Fragonard's Paintings, which were lately discovered, will be among the examples of eighteenth-century painting which will be exhibited at the next loan exhibition at the Guildhall.

The Steamer Krefeld has brought to Germany 175 ancient Chinese bronze guns which formerly stood on the walls of Peking and, according to inscriptions upon them, were cast between 200 and 250 years ago in Chinese arsenals under the superintendence of the Jesuits.

A Pulpit has been erected in St. James's Episcopal church, Cupar, which has been executed by Messrs. Whytock, Reid & Co., of Edinburgh, from the design and under the superintendence of Mr. R. Rowand Anderson, LL.D., architect, Edinburgh.

The Gas Committee of the Birmingham Corporation have decided to spend half a million of money on additional plant, buildings and land, a site of 120 acres having been acquired near Erdington, where the population is rapidly increasing.

Hogarth's House at Chiswick will be put up for auction on the 25th inst.

The London County Council on Tuesday adopted a recommendation by the water committee that a Bill for the purchase by the Council of the undertakings of the eight metropolitan water companies be promoted in the next session of Parliament.

Mr. C. A. Frost, assistant engineer to the Darlinghurst electricity works, has been appointed to the post of assistant electrical engineer to the Bexhill Urban Council.

At a Public Meeting convened at Worthing for the purpose of considering the proposed improvement and reconstruction of the Corporation baths, a resolution was unanimously passed urging the Town Council to carry out a scheme, estimated at 7,000*l.*, without any further delay.

The Memorial of Old Harrovians who have lost their lives during the war is to take the form of an extension eastwards of the north and south aisles, and the cost of the work, which has been designed by Mr. Aston Webb, A.R.A., will be about 6,000*l.*

An Ancient Roman Urn, containing nearly two hundred gold pieces dating from the time of Nero to that of Hadrian, has been discovered at Torralba, in Spain, on the estate of the Marquis de Villorres. It is to be hoped the coins will be saved for some public collection, although generally in Spain old coins are sold to be melted.

A Fine Art and Industrial Exhibition was opened at Newark on Tuesday.

Mr. Herbert J. Finn is exhibiting his water-colour drawings of York Minster, Durham Cathedral, Oxford and Dutch sketches at the Modern Gallery, Bond Street.

Mr. Silvanus Trevail, president of the Society of Architects, has been returned at the head of the poll for the seventh time by the electors of the Eastern Ward of the city of Truro.

The South-Eastern and Chatham Railway Company have contracted to rebuild the Continental Pier at Queenborough at the cost of nearly 90,000*l.*

The Local Government Board have sanctioned the application of the Liverpool City Council to borrow 22,000*l.* for museum purposes.

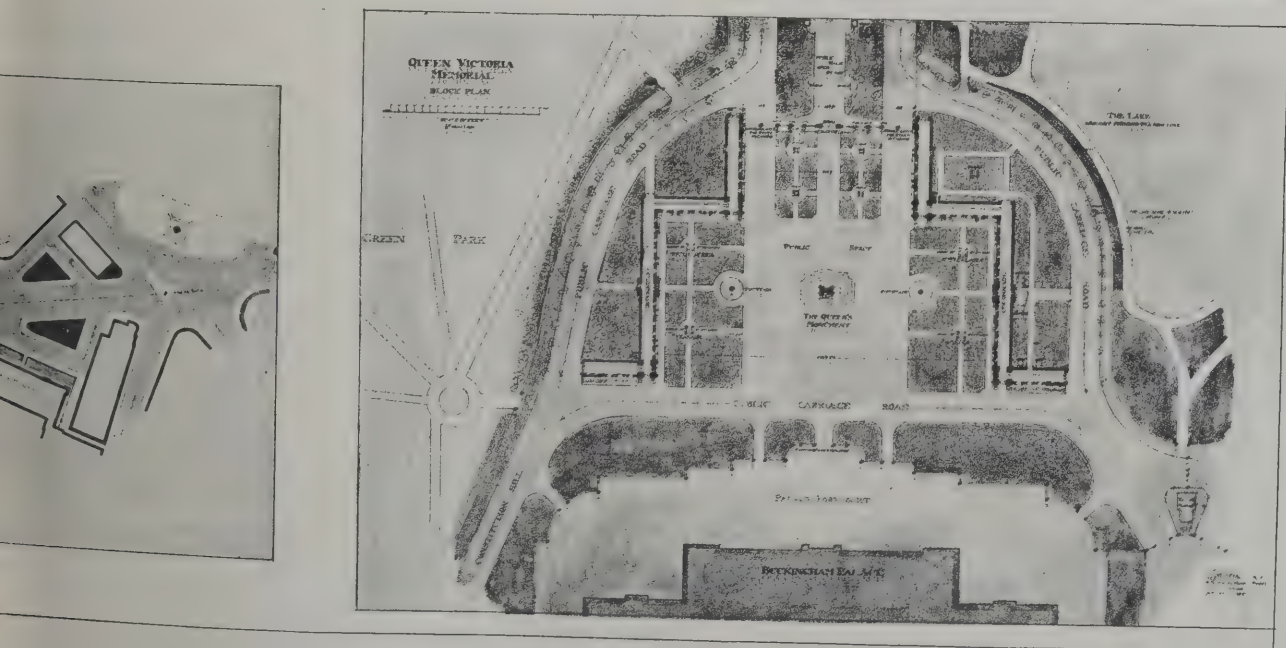

An Adaptation of the Duthie Memorial at Aberdeen, consisting of an Ionic column surmounted by the figure of a trooper, is to be erected at Kokstad, South Africa, as a memorial to the Cape Mounted Riflemen who have fallen in the war.

Mr. G. C. Ashlin, R.E.A., was on Monday elected President of the Royal Institute of the Architects of Ireland in succession to Sir Thomas Drew.

Mr. Paul Waterhouse, M.A., will read a paper on “The day next before the Manchester Society of Architects upon ‘Architecture among the Modern Arts.’”

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BARNSELY.—Nov. 22.—Competitive drawings are invited for the adaptation of property situate in Pitt Street, Barnsley, for union and relief offices, &c. A premium of 20*l.* will be awarded for the accepted design. Mr. C. J. Tyas, clerk, 7 and 19 Regent Street, Barnsley.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive designs for laying-out about 12½ acres of land as ornamental grounds. Premium of 20*l.* offered for the selected design. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive plans for an isolation hospital. Premium of 5*l.* offered. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BURSELM.—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100*l.* and 50*l.* will be awarded for the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

DARTMOUTH.—Nov. 20.—Plans are invited for offices and dwelling-house, to be erected on the South Embankment,

Dartmouth. All particulars may be obtained from the Channel Coaling Co., Ltd.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL.—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

ILKLEY.—Competitive plans are invited for new church and schools at Ilkley. Rev. W. Jones, Hope House, Hebden Bridge.

KINGSTON-UPON-THAMES.—Nov. 14.—Designs are invited for a new public library. Mr. Harold A. Winsor, town clerk, Kingston-upon-Thames.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

CONTRACTS OPEN.

THE new church of All Hallows, Easton, Bristol, which is connected with All Saints (city), was consecrated on the 2nd inst. The scheme provides for a building capable of accommodating 800 worshippers, but this has not yet been completed, the work accomplished including choir, sanctuary, north and south transepts, chapel and three bays of the nave and aisles. The style is English Gothic of the Decorated period. The walls are faced externally and internally with red Pennant stone, Bath stone being used for the dressings, and an open timbered roof has been provided. The choir and sanctuary are large and lofty, the apparent height being increased by lofty arcades between the choir and transepts. The contractors are Messrs. R. Wilkins & Sons, of Surrey Street, and the architects Messrs. Crisp & Oatley, of Edinburgh Chambers, Baldwin Street.

Subscribed Capital, £2,228 875.

ELECTRIC NOTES.

At a meeting of the Rhosllanerchrugog Parish Council it was resolved to invite Mr. George R. Peers, electrical engineer, Manchester, to give information as to the cost of an installation and working of the electric light.

At Hackney on the 31st ult. the inauguration took place of the electricity and refuse destructor works, which have cost 285,000*l.*, and occupy only so much of an acquired site of five acres on the River Lea Navigation Cut that ample space remains for future expansion.

An association of Northumberland coalowners has resolved to take up the matter of electrical power for working and lighting the mines as well as tramways in populous districts where the collieries are at a distance from the villages and homes of the workers. The syndicate contemplate, as the Northumberland Electric Power Company, applying for powers to Parliament.

The Coventry electric-light committee have issued a report in which they state they have reconsidered the existing tariff, and as the plant is not fully engaged they recommend that the charge for the third and subsequent hours of demand should be reduced from 3*d.* to 1*d.*, and the charge for purposes other than lighting be altered to 1½*d.* per unit.

The Russian Ministry of Ways and Communications appointed a special commission to discuss the project brought forward by a syndicate of foreign capitalists for the purpose of installing a system of electrical towage on the Ladoga Canal. The syndicate proposes to erect works which shall not only supply the necessary energy for towing purposes and for lighting the canal, but be capable of supplying manufacturers and St. Petersburg with power.

MR. H. PERCY BOULNOIS, Local Government Board inspector, held an inquiry at the Guildhall, Worcester, on Tuesday, into the proposal of the City Council to erect and equip a supplemental electricity generating station, at a cost of 31,111*l.* The new works have become necessary by reason of the conversion of the tramways to electric traction, and it is proposed to give the British Electric Traction Company, who have acquired the powers to run the trams in the city and district, notice fixing December 1, 1902, as the date for the commencement of the supply of current for traction purposes. The town clerk (Mr. S. Southall) laid the proposal before the inspector, and no opposition was offered.

ELECTRIC-LIGHTING works are being constructed at Hawick, N.B., by the Urban Electric Supply Company at a total cost of about 17,000*l.* The company, whose headquarters are in London, have twelve stations throughout the country, including that at Hawick. It is intended to supply customers with electric power, light and heat. An engine of 100 horsepower has meantime been put down in Commercial Road to give the necessary power for a temporary installation at the new theatre, to be ready within a fortnight. Cables are being laid in the principal streets, and it is expected that the works will be in full operation next spring. The cost of street-lamps will not be more than 3*d.* per unit, and for houses and business premises at rates varying from 4*d.* to 7*d.* per unit. It is calculated that electric light at 4*d.* per unit is equivalent to gaslight at 2*s.* 7*d.* per 1,000 cubic feet.

EXTENSIVE preparations for laying down the electric tramways at Ilkeston are being made by the contractors, Messrs. Dick, Kerr & Co. It is expected that the work will be completed within six months. The length of the line proposed to be made is over three miles, and extends from Cotmanhay to Hallam Fields, the northern and southern extremities of the borough. In the first instance, the Town Council proposed to erect works to produce their own electrical energy, but subsequently arrangements were made with the Derbyshire and Notts Electrical Supply Company to furnish the requisite energy for the tramways and electric lighting, the company undertaking to do so on or before August 7 next. The principal streets of the town are to be lighted by means of arc lamps.

A PROPOSAL is under consideration in Kilmalcolm, N.B., to introduce the electric light. A circular has been sent to the principal householders in the district, along with an inquiry form asking if the receiver is willing to introduce the electric light, and to state what number of lights he estimates he will require. The circular sets forth that a provisional committee of influential local men has been formed to see if electricity can be conveniently and economically introduced. At a recent meeting Mr. J. L. Napier, consulting engineer, read a favourable report on alternative schemes, and it was after consideration of that report that the committee decided to circularise the inhabitants. It is stated by the promoters that the light will be supplied at less than the cost of an equivalent amount of light from gas, and the more generally the new light is adopted the cheaper it will become. Negotiations have been entered into with the Clyde Valley Electric Power Company, and the

D. C. HALDEMAN, General Manager.

committee intend going fully into the matter when the replies to the circular have been sent in.

A RATEPAYERS' meeting has been held at Holyhead Town Hall in connection with the proposal of the Urban District Council to acquire a provisional order for lighting Holyhead and its vicinity with electricity. The Rev. John Hughes said that the question of getting rid of the refuse of the town had been before the Council for many years, and the methods of dealing with it had proved totally unsatisfactory. By careful inquiry it had been ascertained that this nuisance could be effectually destroyed, and the town lighted cheaply and efficiently. At present 700*l.* was spent in lighting the town, which was equal to the interest of 20,000*l.* They would be able to construct a refuse destructor and supply electric light at a cost of 14,575*l.* with a net profit of 396*l.* The Council would require to borrow 16,000*l.* for this purpose, to be repaid in a period of thirty years. Councillor James Lansbury contended that the establishment of electric light was absolutely necessary. The proposal found supporters in some of the leading ratepayers, and was accepted by the gathering.

At a meeting of Glasgow Technical College Scientific Society on Saturday evening, a paper was read by Mr. J. Gray Scott, A.I.E.E., burgh electrical engineer, Leith, on "Electricity Works Load Factors." Mr. C. P. Hogg, M.Inst.C.E., president of the Society, presided over a large attendance. Mr. Scott explained the meaning of the term load factor, its importance in the generation of electricity, and the various uses to which it might be applied, and described the maximum demand system of charging which is based on this principle, and also referred to the various other systems of charging which are in vogue in other towns. He maintained that where the maximum demand system is in use it should be employed throughout, and deprecated the introduction of alternative systems of charging, and further urged that where employed the maximum and minimum charges should be adjusted to correspond with the capital and running costs of the undertaking. Referring to the undertaking of the Leith Corporation the lecturer showed by a number of charts the progress made and the influence of the load factor on the working costs of the undertaking. The system of charging in use at Leith, he said, was the flat rate system, and though no system was perfect, that one had a number of advantages. Thereafter he treated load factors accruing to the various classes of consumers, and pointed out the advantage to an electricity works of a tramway supply. The load factor of an electric tramway

would be about 60 per cent., and would, of course, increase the load factor of the plant provided, in consequence of its favourable effect on the load factor of the load. Cable tramways had, of course, a similar load factor, but unfortunately it was what one might term a dead load factor. The paper was illustrated by means of lantern slides referring to the Leith Corporation electricity works.

TRADE NOTES.

THE new chapel and school at Summerhill, near Wrexham, have lately been fitted with the well-known "small tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool.

THE heating of St. Barnabas Church, Hull, is to be by Spencer's well-known low-pressure hot-water apparatus and patent heating and ventilating "Ventilo" radiators. The patentee, Mr. W. F. Spencer, Cross Bank Works, Oldham, is also installing the apparatus.

THE opening meeting of the session in connection with the Chester and North Wales Archæological and Historic Society was held in the lecture theatre of the Grosvenor Museum on the 28th ult., when Mr. Frank H. Williams, at the request of the Council, exhibited and described the various objects in the collection of antiquities recently presented by him to the Society. There was a fair attendance, and at the close Mr. Williams was accorded a hearty vote of thanks on the proposition of Archdeacon Barber, seconded by Dr. Stalterfoth.

THE church now in course of erection in Prince Consort Road has been designed by Mr. G. F. Bodley, A.R.A. The plan of the church will consist of a wide nave and chancel, the latter being formed only by a very open screen without the obstruction of a chancel arch; there are aisles, and on the one side they are double, this arrangement suiting the site; there will be wide and lofty piers and arches and traceried windows. The character will be that of a town church in the style and manner of the fourteenth century. It will be strictly English in conception and detail, treated in a broad and somewhat original manner. Stone arches of a bold character will be thrown across the aisles, and form, as it were, flying buttresses to strengthen the construction of the wide nave roof. The cost, inclusive of the site, will be 31,000*l.*

BUILDING AND BUILDERS.

A NEW United Free church is about to be erected at Cults, Aberdeenshire, at a cost of about 5,000*l.*, and the first sod was cut on Saturday last.

THE Sedgfield Rural District Council have purchased a site near the County Asylum for the erection of an isolation hospital.

THE Local Government Board have authorised the Birmingham Board of Guardians to extend the farm buildings at the Marston Green cottage homes, and to build two labourers' cottages at a cost not exceeding 1,784*l.*

THE foundation-stones have been laid of a new Congregational church at Annan, N.B. The church, which will be built of red sandstone from Corsehill Quarries, will accommodate 450. The cost is estimated at 3,500*l.*

MR. WOODMAN HILL will read a paper before the Institute of Builders at St. James's Hall on the 20th inst. upon "Submarine Construction by Diving and Other Compressed Air Methods, Cylinder Sinking and Tunnelling under Compressed Air." Mr. Charles Wall will preside.

ON Saturday afternoon the church at Ash, near Whitchurch, Hants, was crowded, the occasion being the consecration of a new chancel, erected at a cost of 400*l.*, in memory of the Rev. Henry Brumell Finch, for eighteen years the vicar of the parish, and who died on November 8, 1899.

A STAINED-GLASS window which has been placed in Holy Trinity Church, Oswestry, in memory of the late Queen Victoria, was dedicated on Monday. The window represents the Queen in royal robes kneeling and laying down her symbols of earthly sovereignty at the feet of Christ and receiving the crown of everlasting life.

THE tenders for the erection of the Cheltenham Town Hall, the architect's estimate of the cost of which was put at 35,000*l.*, were opened on the 31st ult. They were nineteen in number, and included one from Birmingham and others from the neighbourhood and further afield. The highest (a Gloucester one) was 36,489*l.* and the lowest (a Nottingham tender) was 28,397*l.* Subject to inquiry and confirmation by the architect, the committee recommend acceptance of the latter.

AT the monthly meeting of the Longton Town Council the sanitary committee recommended that the tender of M. H. P. Embrey, of King Street, Fenton, should be accepted for the erection of the proposed new isolation hospital for the sum of 9,153*l.*, and, further, that application should be made to the Local Government Board for sanction to a loan of 12,000*l.* for the erection and furnishing of the hospital, instead of 10,000*l.* as previously agreed upon.

THE organising committees of the First International Exhibition of Modern Decorative Art, to be held in Turin in 1902, have recently decided upon the erection of buildings covering a space of 7,000 square metres, in addition to those already provided for, and perhaps even this addition will not prove sufficient. The Exhibition buildings, which at first were intended to cover a space of about 20,000 square metres will cover a surface of about 34,000 square metres.

THE block of buildings which have just been erected by the Parish Council of Kilmalcolm for Council offices, at a cost of about 1,400*l.*, were formally taken possession of on Monday night, when the Council met for the first time in them. The buildings, which are of artistic design, consist of a well-appointed inspector's office, board-room, &c., with house for inspector above. Mr. Alexander Gardener, 209 St. Vincent Street, Glasgow, was the architect.

A NUMBER of properties which the Leeds Corporation propose to acquire in connection with street improvements will have to be dealt with at the meeting of the City Council tomorrow, Saturday. These include the purchase, for 6,000*l.*, of the St. John's Inn, in Wade Lane, which is being widened; and that of the Bank Farm Hill estate, comprising some 2,364 square yards, for the improvement of Richmond Street. The price proposed to be paid for the latter is 4,000*l.* Another important undertaking that the Council will be asked to ratify is an arrangement with the Midland Railway Company, whereby the latter agree to dedicate some 997 square yards of land to Balm Road, and to widen Balm Road bridge to 50 feet within

The "ONE" Range.

PATENT 1331/01.

M. F. Co. LD. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;

CLARK, HUNT & CO., Shoreditch;

O'BRIEN, THOMAS & CO., Upper Thames Street;

R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;

ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool, and a third oven can be arranged if required.

three years. The Corporation will contribute 5,144*l.* towards the cost of the widening of this bridge.

THE foundation-stone was laid on Saturday of a new church which is to be erected at Palfrey, Walsall, a district of rapid growth, the whole population of which, numbering 5,000 or 6,000, has sprung up in quite recent years. The church is to take the place of an iron structure which has done duty as a mission church in connection with Caldmore parish, and a new parish is to be formed. The contract has been undertaken by Mr. W. Hopkin, of Birmingham, for 4,400*l.*, the architects being Messrs. J. E. K. & J. P. Cutts, of London.

THE annual meeting of the Building Trades Exchange of the City and District of Glasgow, Ltd., was held in Glasgow on the 30th ult., Colonel Bennett presiding. The eighth annual report showed that the treasurer's accounts brought out an income of 701*l.* 7*s.* 9*d.* and an expenditure of 666*l.* 10*s.* 5*d.* The executive recommended a dividend of 4 per cent. on paid-up capital. During the year there had not been any work of particular moment to which the Exchange could devote its energies, with the exception of the scheme for the extension of the Glasgow and West of Scotland Technical College. The report was adopted.

THE Local Government Board having demanded certain alterations in the plans of the infectious diseases hospital about to be erected at Langholm, N.B., a meeting of the district and burgh representatives was held in the Town Hall to consider a report by the architect. The architect reported that the alterations would involve an increased cost of 250*l.* This could not be provided out of the amount which the representatives had decided on as the maximum cost of the hospital. If, however, brick was used instead of stone for the building a saving of the required sum could be effected. The meeting declined to entertain the erection of a brick building, and it was unanimously resolved to vote an extra sum of 250*l.*

THE seventh annual meeting of the Scottish Building Trades Federation was held last week in the Cockburn hotel, Bath Street, Glasgow. Representatives were present from the various districts of the country, including Inverness, Keith, Aberdeen, Arbroath, Dundee, Perth, Stirling, Edinburgh, Glasgow, Hamilton, Coatbridge, Dumfries, Paisley and Govan. Mr. Alex. Beveridge, builder, Perth, the president, occupied the chair. Mr. James L. Selkirk, C.A., Glasgow, submitted the annual report, which narrated very fully the work undertaken during the past year by the executive to extend and consolidate

the organisation throughout the country. The consultative committee (which consists of four representatives from each of the four principal cities) had been keeping themselves informed as to the state of the building trades during the year, with a view to rendering assistance in any of the districts where such might be required. They found that much importance was being attached to their work, because by being kept informed as to the prospects of trade they were in the best possible position to render timely and suitable advice and assistance. The question of finances was specially dealt with, and energetic steps were resolved upon to place the Federation in a strong and healthy position financially. Various other matters were considered, and resolutions arrived at regarding them. Office-bearers for the ensuing year were appointed as follows:—President, Mr. Robert Lamb, builder, Edinburgh; vice-presidents, Messrs. Thomas C. Stock, wright, Dundee, and John Morgan, wright, Aberdeen, together with eleven members of executive in room of those retiring at this time; secretary, Mr. James L. Selkirk, C.A., Glasgow. The next half-yearly meeting of the Federation was appointed to be held in Perth, and the next meeting of executive in Dumfries. A hearty vote of thanks was awarded to the chairman for presiding.

VARIETIES.

THE new Roman Catholic church of St. James, Paisley, was formally opened on Sunday.

A NEW public library was opened at Blackpool on the 31st ult.

A LECTURE on "Design and Designers of the Victorian Epoch" will be delivered by Mr. G. C. Haité at the meeting of the Society of Designers on the 19th inst.

MR. FRANK CAWS will deliver his presidential address before the Northern Architectural Association on Wednesday next.

THE foundation-stone was laid on Saturday of a new church which is to be erected at Lower Sydenham, at a cost of 8,000*l.*, from designs prepared by Mr. G. H. Fellowes Prynne.

THE bells of Exeter Cathedral are to be rehung in an iron cage if sufficient money is provided; the cost will be about 1,200*l.* At present, owing to the state of the timbers, the sounds are generally discordant.

200-215
TOTTENHAM COURT ROAD
(Oppos to Goudge Street,
LONDON, W.

Council Chamber at Hemel Hempstead, fitted and furnished by HEWETSONS.

A NEW technical institute—to be known as the Victoria Memorial Institute—was opened at Padiham on the 31st ult. The building, which will accommodate 400 students, has been erected on a site in Burnley Road given by Sir Ughtred Kay-Shuttleworth, M.P. The cost of the institute is about 6,000*l*.

THE foundation-stone was laid on the 31st ult. of the new church at Cricklewood, towards which the Hampstead Church are giving their thanksgiving fund of 2,000*l*. The new church is in Chichele Road, and the seating capacity will be for 750 persons, while the lecture hall beneath the church will accommodate 600 persons. The estimated cost will be 10,500*l*.

THE new church in Carnock Street, Greenock, erected for the congregation of St. Lawrence, was opened and dedicated on Sunday last. Built of red sandstone in the Early Decorated style of architecture, the church provides accommodation for 1,000 worshippers. A presbytery to accommodate the clergy has been erected adjoining the church. The cost of the buildings is about 12,000*l*.

THE Sanitary Inspectors' Examination Board have included the Bradford Municipal Technical College, the University College, Sheffield, and the Heriot-Watt College, Edinburgh, among the institutions whose syllabus of instruction is approved by the Board, and the certificates of instruction issued by those institutions are recognised by the Board as qualifying candidates for examination for the purpose of the Public Health (London) Act, 1891.

THE River Wear Commissioners have decided to construct and lease to Messrs. J. L. Thompson & Sons, a local shipbuilding firm, a graving dock 600 feet long. The work will probably cost the Commissioners 100,000*l*., and Messrs. Thompson engage to pay 6,000*l*. per annum, or 6 per cent. The Commissioners possess two graving docks at present, but these will not accommodate vessels of large tonnage, and the result is that Sunderland loses a great deal of repair work.

THE London School Board has decided to hand over the task of rehousing the families displaced by their building schemes to the London County Council, as the chief housing authority of London. The arrears of housing have accumulated for several years, and now amount to liabilities of some 10,000*l*. The School Board will simply transfer the whole of this work to the County Council. In regard to the future the School Board have decided to change their policy. They will, as far as possible, choose sites on unoccupied spaces, and, if not, in richer quarters, where there will be no duty of

rehousing imposed upon them. The Board take the view that they are not fitted by their organisation to be a housing authority, and the precedent of co-operation with the County Council is likely to be a valuable one for future purposes.

A MEETING of the Glasgow Architectural Association was held in their rooms, 187 Pitt Street, on Tuesday night (5th inst.), the president, Mr. Chas. E. Whitelaw, in the chair. A very interesting member's paper, by Mr. James Salmon, was read on "Voices in Stones," or "The Language of Architecture." At the close of the paper Mr. Alex. McGibbon A.R.I.B.A., led the discussion, which was continued by a number of members.

A PETITION has been deposited with the town clerk and will shortly be presented to the Corporation by Mr. Edward Lee (chairman of the law and city courts committee), praying that body to use its influence to bring about the further postponement of the Land Transfer Act to the City of London until a properly constituted inquiry has been held and concluded. The petitioners urge that the new system involves grave inconveniences, and largely increases the expense and delay incident to mortgages and purchases of property without any corresponding advantage, and that it would be peculiarly unsuitable in its application to property in the City and transactions connected therewith. It is further pointed out that the Act was passed by Parliament as an experimental measure only, and that, as under its provisions some 20,000 titles have been already registered in the country, ample materials exist for the suggested inquiry.

THE new rooms for the teaching of science at George Watson (boys) College, Lauriston, Edinburgh, were formally opened on the 1st inst. The new department has been secured by raising the height of the school buildings one storey. It has been placed on the top flat, and includes chemistry and physical laboratories, a store between them, a room for the teaching of advanced science and a teaching theatre. All are well lighted and ventilated by means of roof lights and electric fans, and are fitted up in the most approved modern fashion with chemical, physical and electrical tables and apparatus. The constructive work carried out under a committee of the Governors of the College, was executed by Mr. Macandrew, builder, and the fitting-up of the rooms was effected under the surveillance of Mr. T. P. Watson, M.A., B.Sc., F.R.S.E., the science master in the College. 4,000*l*. has been spent in building and furnishing.

LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c. Cost of the Winch covered in a few weeks.

This Machine will be found invaluable in Warehouses, Factories, Maltings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building.

The Machine is so named because of its adaptability as means of lifting or lowering articles and materials of every kind with great despatch and Safety.

WERNER, PFLEIDERER & PERKINS,
(A. M. PERKINS & SON, LTD.),

REGENT SQUARE, GRAY'S INN ROAD,

THE large goods station which has been built at Avenue Road to meet the requirements of the London and North-Western Railway Company in the Aston district of Birmingham, has now been opened. The cost of the extensive depot, which covers some 6 acres, is 100,000*l.*; over 2,000 tons of steel were employed in its construction and accommodation exists in the grain warehouses for 10,000 sacks. A suite of offices has been built in which room will be found for eighty clerks, and the messrooms adjoining will meet the needs of the carters and carmen, for whom the depot will be the headquarters. Altogether 207 workmen will be employed there. The new goods station, affording as it does double the storage accommodation at Curzon Street, will be used not only in connection with the districts of Aston, Nechells and Saltley, but will deal with a large portion of the through traffic from the North, thus relieving Curzon Street of a pressure which has been increasingly felt. The modern character of the appliances at the Avenue Road warehouse will greatly facilitate this work. Built upon a solid foundation of 500 tons of cement, it consists of four floors 254 feet long and 150 wide. The basement, which is concrete throughout, will probably be used for bonded stores and for cold storage, whilst the ground floor possesses every equipment for unloading goods. Sixteen sets of rails lead into covered verandahs in which loading or unloading operations may be conducted with the greatest convenience by means of fifteen hydraulic and six hand cranes. Automatic lifts capable of holding tons of material communicate with the floors above, whilst outside the shed are two powerful cranes ready to cope with any emergency. Hops and general merchandise will probably be stored on the first floor and grain on the second, and shoots of an improved kind have been constructed to convey the sacks from the top to the bottom. The building is practically fireproof, the fact that the floors contain 7 inches of solid timber being regarded as an important guarantee in this direction.

WESTMINSTER WOOD-PAVING CONTRACTS.

THE works committee of the Westminster City Council, after fully investigating the matter, have prepared a report on the charges which have been made by the Westminster ratepayers' committee in connection with the action of the works committee in recommending, and of the City Council in accepting, on August 1, the tender of the Improved Wood-Pavement

Company for the relaying and maintenance of certain streets with 8-inch blocks, whereas 9-inch blocks were specified in the specification, and in adopting American red gum wood for a number of other streets. The report states that two of the tenders were ruled out of order on the ground that the tenderers had only tendered for the laying of the paving and not for the maintenance, and did not give any time for completing the work. The question was raised upon the tender of the Improved Wood-Pavement Company that they had tendered as for their usual work—viz. 8-inch blocks instead of 9-inch blocks, as in the specification. It was stated that the 8-inch block was the block which the Company used in all the districts in which they had laid paving, and it was before the committee that they had laid large quantities of similar paving in the City and that their paving had proved to be the best of the soft-wood pavings in use. Guided by the fact that it had lasted for a large number of years and that their tender was for the whole work, and was entirely in accordance otherwise with the specification, except that they stated that they could not guarantee any specific percentage of tar acids in the creosote oil to be used by them, the sub-committee decided that they would receive their tender, as they were *bona fide* tendering for work they were in the habit of doing, providing that they guaranteed the specified percentage of tar acids in the creosote. The consideration of these and the other tenders was then proceeded with, and the sub-committee reported on July 24 to the parent committee recommending that certain streets, including Whitehall, should be paved with creosoted yellow deal blocks and certain others with red gum wood blocks. When the matter came before the parent committee an amendment to pave Whitehall with red gum wood blocks was carried. The arguments laid before the committee were (1) the very much shorter time in which Mr. Alcott, in his tender for red gum wood blocks, undertook to do the work; and (2) the very much cheaper rate at which the work was to be done than with yellow deal blocks, taking into account the cost of maintenance. Various charges of undue influence were also made. The committee, after careful consideration of the whole of the allegations of the ratepayers' committee and of the statements of the members of the Council and of Mr. Monson, the surveyor of St. James's, and of the other facts before them, express the opinion that the allegations under consideration are either untrue or a distortion of facts, and submit that nothing has been done contrary to the interests of the Council and the ratepayers.

DURHAM MINERS' HOMES.

ON Saturday last Sir Lindsay Wood opened a number of cottages at Shincliffe Colliery, near Durham city, designed for the use of aged miners belonging to the county. Twelve cottages have been repaired and made habitable, but the committee of the Durham Miners' Homes Association have secured sixty, and these they intend should be used by old miners who are past work, the object being to form a small colony of such men, with their wives. The Association have started a colony of the kind at Haswell Moor, in another part of the county, where 116 cottages are occupied by old miners and their wives, each man being in receipt of 4s. or 4s. 6d. per week from the Miners' Permanent Relief Fund. The Shincliffe houses, valued at 300l., were given to the committee by Mr. J. H. Love (Messrs. Ferens & Love, colliery owners). Three sites in the western part of the county have also been secured by the committee, and upon these it is intended to start similar colonies. A letter was read from the Bishop of Durham apologising for his absence, and wishing the scheme every success. Mr. John Wilson, M.P., who presided, said the Government required to be shown the way to deal with the problem of poverty in old age, and the Durham miners were giving them an object-lesson. For twenty-five years they had given the old men 4s. 6d. a week from the relief fund, but they now desired to add a house to it. Canon Moore-Eede, who is treasurer to the Association, and the Dean of Durham also spoke, wishing the scheme every success.

SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, November 4, Mr. Charles Mason, president, in the chair, a paper was read on "The Main Drainage of Ilford," by Mr. Roger Gaskell Hetherington, M.A.

The author first observed that the population of Ilford had increased by 35,000 during the last fifteen years, which necessitated considerable additions to the sewerage. The first drainage scheme was prepared by the late Mr. Brundel in 1882, when the population was only 7,500. The present scheme has been designed for a population of over 100,000 by Messrs. John Taylor Sons & Santo Crimp, and the old system has been

incorporated with it. The drainage area is such that one portion of it only can be drained by gravitation. The various lines of sewers and their functions were described, and details of the construction of the main sewers were given. The general screening and pumping arrangements on the low-level sewers were also described.

The outfall works as first constructed became in time inadequate, and they were greatly enlarged in 1898 and the present system of dealing with the sewage was then started. This method consists of treating the crude sewage with milk of lime and ferrous sulphate, and then passing it through settling tanks. From the settling tanks the effluent is taken into coke breeze bacteria beds, and from thence to the river Roding, the sludge left in the tanks being pressed by sludge-pressing machinery. Owing to the works being required to deal with a considerably larger flow than that for which they were designed, the effluent has become unsatisfactory, and other modifications in the works are now being undertaken. The chief of these is the construction of an entirely new outfall to the river Thames. This effluent pipe will discharge into the Thames below the London northern outfall at Barking. As this outfall pipe, which is 30 inches in diameter, passes through a large tract of land lying below high-tide level, elaborate precautions have had to be taken to prevent tidal water being admitted to this low-lying land by any failure of the pipe. The scheme as a whole presents some interesting points as regards meeting the ever-recurring problem of treating the sewage of a district with a rapidly increasing population without discarding the existing system, which was never designed for great enlargement.

THE new Roman Catholic schools in South William Street, Workington, which have been built in consequence of the lack of accommodation at the old schools at Banklands, were opened last week. The school is a brick building of two storeys, and will hold 650 to 700 scholars. On the ground-floor is a schoolroom 25 feet by 90 feet, and two classrooms 26 feet square, besides lavatories and cloakrooms. Above these is a similar schoolroom and classrooms, while the staircase is of stone and fireproof. The architect is Mr. James Howes, and the sole contractor Mr. Beattie Towers, both of Workington.

HEATING AND PLUMBING IN GERMANY.

ACCORDING to a report by the United States Consul in Brunswick on heating and plumbing arrangements in Germany, improved methods of steam or hot-water heating, sanitary plumbing and elevators have not been widely adopted in Central and North Germany. South Germany is said to be more advanced. In the city of Brunswick there are a large number of hotels, but as far as the Consul knows only one can boast of an elevator and steam-heaters. Last year steam-heating was introduced for the first time in four newly-built houses, and the apparatus was furnished by a firm in Geneva, N.Y. With a conservatism that is remarkable, the people adhere to the old system of heating by "Kachelofen," or stoves encased in tiles. These huge arrangements, standing in the corner of a room, look as if they would heat a whole house, but when their modest iron interior is examined one is convinced that they do not suffice to heat a room. There is no word in the German language for furnace, and this method of heating is known here as "central heizung," or central heating. Lately there has been introduced in a new flat a method of heating through steam or hot water, the apparatus standing in the hall or corridor of each storey. This system has not been tested yet. Most people in Germany live in flats, there are but few private residences. The difficulty in heating an apartment building from the basement has been the distribution of the expense, as each family must pay for its own fuel. This expense is not assumed by the landlord. As to plumbing, the kitchen ranges are without water backs, and when hot water is required for a bath a fire must be made under a stove surmounted by a boiler in the bath-room. There is unquestionably, adds the Consul, a large field which has not been adequately worked for American enterprise. Manufacturers and dealers in elevators, heating apparatus and plumbing materials who desire to introduce their goods should have advertising matter in the German language. Probably the best way of introducing goods of these kinds is to establish an agency or store where the articles can be inspected.

NEW ARCADES, BIRMINGHAM.

PERHAPS the most important improvement scheme which has been carried out in central Birmingham since the great Corporation Street scheme of the city authorities is that for the

construction of the City and Midland Arcades, which intersect the extensive block of business premises lying between Corporation Street, High Street, New Street and Martineau Street. These new arcades are rapidly approaching completion. They are, in fact, complete, and many of the 200 shops and offices provided are occupied, with the exception of one branch of the City Arcade, which is to provide a second outlet into New Street. The scheme has been planned and executed upon liberal lines, a sum approaching a quarter of a million sterling having been devoted to the work. The main arcade runs from High Street to near the junction of Union and Corporation Streets, and has two branches running off into New Street. The façades presented to the public streets are handsome terra-cotta erections in the Renaissance style, and the prevailing tone inside the arcades is green, the balustrading which fronts the balconies and the pilasters of the shop fronts being highly ornamented on Moresque designs with green faience, shaded to imitate malachite. All the shops have basements, and a subway runs underneath the thoroughfares to facilitate the delivery of goods. By means of the scheme a large area in the centre of the city, which has been almost derelict for business purposes, has been developed, and much space opened up in the principal shopping centre. The extension of the Grand Louvre has accompanied this work, as the City Arcade runs for some distance alongside the Louvre premises, and now provides a number of additional attractive shop fronts and entrances to this important drapery house. The undertaking has been carried through by Mr. E. J. Charles, contractor, on the designs of Messrs. Newton & Cheetham, architects.

INSTITUTION OF JUNIOR ENGINEERS.

AT the inaugural meeting of the twenty-first session of the Institution of Junior Engineers, Sir Lowthian Bell, F.R.S., the retiring president, occupied the chair during the first part of the proceedings, and announced that the Northcott prize had been awarded to Mr. William Powrie for his paper on "The Mutual Relations of Employers and Employed," and the Institution premium to Mr. Samuel Cutler, jun., for his paper on "Carburetted Water Gas."

Mr. P. Marshall moved, and Mr. L. H. Ruigg seconded, a vote of thanks to Sir Lowthian Bell, and this was carried unanimously.

Sir Lowthian Bell briefly acknowledged the compliment

and introduced his successor, Sir John Jackson, whom he invested with the badge of office.

Sir John Jackson then took the chair, and proceeded to deliver his presidential address, in the course of which he said that fortunately contractors for public works, of whom he was one, had not been so much troubled by differences between employers and employed as their friends who were interested in the building of ships, manufacture of machinery, mining, building and otherwise. They now lived in the times of great factories, where so many men were employed that the employer or his chief representative came little in personal contact with the workpeople individually; hence they could not expect the same good feeling to prevail as if they were in the old days when factories were small, when men did not change their locations so often, and when master and man saw more of one another. In some trades one certainly saw with much regret on both sides a great lack of that mutual confidence and sympathy which should prevail between employer and employed—the men through their unions taking every advantage they could, and the employers, on the other hand, combining and doing likewise. He could find no fault with trade unions so long as they were conducted as they once were, only as benefit societies and as legitimate combinations of workmen for enabling them to sell their labour at the best prices; but when, as was the case now, unions not only tried to dictate to the employers as to the management of their business, but also interfered with the liberty of non-unionists, and intimidated with a view of bringing every workman under the control of their so-called leaders and of preventing a man's dealing with his labour—his own property—as he thought best, then he had to say everything against them. He was very pleased to read of the very satisfactory meeting of the Free Labour Association, which held its ninth annual congress in London the week before last, as a movement against the absurd pretensions of present-day trade unionism. The National Free Labour Association had now registered many thousands of men, who had been sent into almost every department of industry—a serious menace to the domination of the trade unions, whose claim, as one of the daily papers had very well put it, was to allow no working man to get his living except upon their terms and with their high permission, one of the most monstrous despotisms which was ever erected. The judgment of the House of Lords in the Taff Vale Railway case was very well described by one of the speakers at the meeting as a "charter of freedom to British industry." In the

name of freedom Mr. Chandler, the president, said "working men were bound hand and foot," and it was the fault of the leaders of the unions that in some trades employers have been forced to form a fighting organisation of their own. If the leaders of these unions had their way the non-union men would be doomed to compulsory idleness, and this, forsooth, in this grand old country of ours in the name of liberty. It had been said that in consequence of the Taff Vale decision some of the unions had proposed to dissolve; but if properly carried on there could be no just reason for this, but they must be made to realise that in free England every man should have the right to live and to sell his labour as he thought best. The ambition of the young workman of the old days was to excel not only in the quality of his work, but in the quantity. The ambition of the disciple of the present-day trade unionism, under which, it was argued, all men, competent and incompetent, should be paid alike, was to think and contrive how he could get the most money for the least work possible. If this spirit was to continue, he feared our nation as a nation of workmen would soon go to the rear. Why, he heard only the other day of an American ironmaster who explained that the reason why his people could cut us out, although they paid higher wages, was that the unions in England so restricted and held back the energy of the best of our workmen that these men emigrated to the States, where men were paid more in accordance with their capabilities, the result being that the American iron masters were getting into their works the very pick of the English and Scotch workers. Speaking of Americans, we had recently heard much of trade rings and combinations among producers in the States with a view of controlling certain raw materials and industries. This policy he could not agree with. For his part he had no sympathy with, but was altogether against what he might term any cut-throat competition among producers or manufacturers, which he was sorry to see so much of among contractors, but, on the other hand, he would look upon such combines as we had recently seen set up in the United States and suggested in England as combinations against the public weal, which should be prevented so far as possible by all legitimate means. Speaking more particularly to those who might be at some time engaged on the staff of a contractor, or even be contractors themselves, he would remind them of the great loss of life which, sad as it had always been, was unavoidable on public works, in the hope that they might realise how all-important it was, in whatever position they might be

placed, to use their very utmost endeavours to reduce this loss of life to a minimum. He thought he was right in stating that, according to the insurance companies' returns, the lives of no less than three men were lost by accident for every 100,000*l.* value of work carried out; and he was told the mortality from accidents in coal and other mines where explosives were used was even higher than that on public works. The strange thing in regard to contractors' accidents was that they did not so often happen to men engaged in work that was known to be dangerous as with work of a more ordinary nature. For instance, during the twenty-five years he had been a contractor he had employed many men as divers, and yet he could not recall to mind one single fatal accident to a diver in his employment. The calling was *prima facie* a dangerous one, and consequently those engaged in it were cautious and took every care; while with other work, such as excavating in timbered trenches, traffic work on railways, quarry work, and so forth, where the dangers were not so apparent, men got careless, and often, with no doubt commendable anxiety in their work, ran risks which were unnecessary and ended in the loss of life. Before concluding he would like to ask them all, each one, in whatever line of business he might be engaged, to do his best to uphold the old-fashioned high character of the English engineer.

A vote of thanks was passed to Sir John Jackson for his address.

PROPOSED UNDERGROUND TRAMWAYS IN LONDON.

THE following report of the highways committee of the London County Council was submitted to the Council, but the consideration of the recommendations must, however, be deferred, according to the standing orders relating to any proposed expenditure over 5,000*l.*, for one week:—

We have given further consideration to the resolution passed at the conference held on June 29 and November 7, 1900, between representatives of the Council, of the City Corporation and of the then existing vestries and district boards as follows:—"That this conference is of opinion that in all new leading thoroughfares subways should be constructed in which the water and gas mains, pipes, &c., could be placed." We may state that inquiries have been made by the Secretary of State for the Home Department as to what action the Council

proposes to take to give effect to this resolution of the conference, so that it may be presumed that the Government considers the matter of importance. The improvements committee reported on July 2 last that the resolution affirmed a principle which has been pursued by the Council for some years; but we think that, having regard to the enormous amount of inconvenience to the public and loss to the trading community by the continual breaking up of the public thoroughfares by companies and others having statutory rights, the time has arrived for the Council to seek power to construct subways in existing thoroughfares, where it may be deemed advantageous to do so, for the reception of gas and water mains and other pipes and wires connected with the various services of London. In this connection we have also considered the question of the desirability of the adoption for London of a system of shallow underground tramways, which was referred to us by the Council on June 13, 1899; and we are strongly advised by the tramways manager and electrical engineer, as the result of their observations during their recent visit to New York and Boston, where the system is in operation, that it is extremely desirable that an endeavour should be made at the earliest possible moment to introduce a similar system for London. They state that the adoption of the system of underground tramways in the cities above specified has relieved to a large extent the congestion, which was previously very serious, of the traffic on the surface of the streets, and that owing to the shallow depth at which the tramways-subways are laid, there is little or no difficulty as regards entrances and exits, which are provided by means of short flights of steps, and thus the expense of constructing and working lifts, which are necessities of the deep-level railways, is avoided. Moreover, we are informed that the atmosphere in these subways is preferable to that of the deep-level railways.

We think, therefore, that it is advisable that the Council should seek to obtain powers for the construction under the streets of such tramways-subways as may be considered desirable for the purpose of linking up the various surface tramways north and south of the Thames, and by this means of providing cheap and badly needed facilities of communication, and make the whole of the London tramways into a compact system of transit. We suggest that the tramways-subway should in each instance occupy the centre of the thoroughfare, and that a subway for pipes, &c., should be constructed on each side of it. We are fully aware of the fact that the con-

struction of such a system of subways as we propose would be costly; but, even taking that into account, we are of opinion that in view of the public convenience which they would provide, and of the fact that not only would the tramways in them prove a source of profit, but that the placing of the pipes and wires in subways would remedy the great and crying evil of the continual breaking up of the public thoroughfares, it is desirable on all grounds that the system should be carried out.

It appears to us that at the present juncture an admirable opportunity presents itself of ascertaining whether the scheme would be, as we fully anticipate it would, a complete success. Under powers conferred upon the Council by Parliament, an important new thoroughfare between Holborn and the Strand is in course of construction, and in addition to the subways already authorised for the reception of the gas, water and other pipes and wires, it appears to us that this would be an ideal route for the trial of a first experiment of the shallow underground system of tramways. One of the termini of the Council's northern system of tramways (leased to the North Metropolitan Tramways Company) is at Theobald's Road, and the Council will apply next Session for powers to construct tramways along the Victoria Embankment. Our proposal is that a tramways-subway should be constructed from the level of the Victoria Embankment, under Wellington Street, across the Strand and through the new street thence to Holborn, under Holborn and Southampton Row, and that the tramway should be taken up an incline to Theobald's Road or to Rosebery Avenue, if that should be found more convenient. The estimate of the cost of construction of such a subway, and of the tramway for a system of electrical traction is 282,000/. If our proposal should be carried out the eastern parts of London served by the tramways converging upon the Theobald's Road terminus would have the advantage of being enabled to travel to the Strand and through to Westminster, and also to within an easy distance of Charing Cross. The Council will perceive from the above that, after having given the greatest consideration to the matter, we are convinced that it is desirable that, even taking into account the amount of the first cost, the experiment should be tried, and that the proposed underground tramways would not only be a means of improving the facilities of communication between the tramways systems north and south of the river Thames, but would prove a great success from a pecuniary point of view.

We have, in accordance with the standing order with reference to proposals for new legislation, consulted the

solicitor, who has expressed the opinion that the above proposal would come within the meaning of section 14 of the Metropolis Management Act, 1855, and that the Council would have power to spend money in promoting a Bill on the subject. The recommendations which we have to submit are as follows:—

(a) That the standing orders of the Council relative to applications to Parliament for powers be suspended in order that the Council may consider the following recommendation:—

(b) That the Council do apply, in the next session of Parliament (1) for powers to make subways in streets for the reception of pipes, wires and other things where desirable, and for electrical traction and other purposes of locomotion; and (2) powers to construct a subway and to construct tramways therein for electrical traction from the Victoria Embankment, along Wellington Street, across the Strand, through the new street, thence to Holborn, under Holborn and Southampton Row, and to take such tramways by an inclined plane to the tramways terminus in Theobald's Road, or to the tramways authorised to be constructed in Rosebery Avenue, as may be considered most expedient.

SANITARY ARCHITECTURE.*

THE subject of my remarks is the art of planning and constructing buildings, and therefore the title "Architecture" would have sufficiently described what I am about to say; but with the immense growth of populations and the concentration of people in cities, with the busy lives we all live in consequence, it is often desirable to emphasise a simple description by the use of an appropriate adjective, hence I have made the title of my address "Sanitary Architecture." The architect is the chief workman, and as an architect speaking to clerks of works, builders' foremen and others, who have or hope to have to deal with the construction of buildings, I desire to speak as

from one workman to others, and shall be pleased in that relation to discuss with any of you, at the close of my address, any points I may have raised or which may occur to you in connection with the subject we are about to consider.

Design is our starting-point, and in this the planning should be our primary consideration. With regard to site and aspect I do not propose to deal. Both are large questions, and every separate case must be dealt with on its own merits. In cities there is often no choice, and even elsewhere the situation, contour of the land, &c., often make it necessary to vary planning in relation to the points of the compass.

Given the site, and having the aspect of our building settled, the first consideration therefore should be to so design the plan of our building that it may best serve the purposes to which it is to be devoted. Doors for access at all convenient points, windows to secure ample light and ventilation, well-lighted corridors to separate and give access to the different apartments, will always give an irregular outline which will lend itself to architectural effect. This irregular outline, so desirable from an artistic point of view, will be accentuated where the water-closets, lavatories and sinks are so placed that disconnecting ventilation between these arrangements and other parts of the building is secured by means of lobbies with windows in opposite walls, which is the only method by which a through current of air can be obtained without complicated devices beyond the control of the ordinary residents. In this and all other matters connected with a building, it should always be our aim to so contrive that when it is handed over to those who are to occupy it, there shall be as little need as possible for the intervention of greater skill than the ordinary occupants may be reasonably expected to possess. In so far as specially skilled workmen may be necessary to insure a continuous satisfactory condition of the building, in just so far have those responsible for its construction proved their want of skill either in design or workmanship.

Having planned our rooms, corridors, &c., we proceed to design our elevations, sections and roofs, and here again the uses to which the building is to be put should be the first consideration. As the human face is an index of the character of the individual, so should the elevations of a building indicate the purpose for which the building was erected. There should be no attempt at deception. Where a rain-pipe is necessary the intelligent man desires to see that it has been provided, and is annoyed with a façade erected as if a rainy season never existed. He will also know that the pipe buried in the wall

may prove a source of danger to the building at any moment, and only through necessity would he make such a structure his place of abode. If this is important in the matter of rain-pipes, it becomes doubly important with pipes from sanitary fittings, despite the retrograde action of the London County Council in the matter of soil-pipes. Until this year the by-laws of the London County Council provided that all soil-pipes should be outside the building. It is not within my province in this address to consider the question as to whether it is desirable that the state or the municipality should have power to make and enforce such a by-law as the one to which I have referred, but I have no hesitation in saying that sanitary architecture requires all such pipes to be outside, and, further, it maintains that these pipes being necessary should be provided for in and form part of the design of the elevation of the building to which they are essential.

For some years the by-laws of the London County Council, under the Public Health (London) Act, 1891, provided that every soil-pipe in connection with a new building should be outside the building. This definite by-law has now been repealed, and with the approval of the Local Government Board, another has been substituted under the Metropolis Management Act, 1855. This new by-law runs as follows:—"A soil-pipe in connection with a new building or an existing building shall, whenever practicable, be situated outside such building." Of course there is nothing more practicable than the fixing of a soil-pipe in the open in connection with any building, new or old, where the will exists, but the words "whenever practicable" in the new by-law must be read in connection with the rescinding of the old by-law which was imperative and insisted on every soil-pipe being fixed outside. But, none the less, the absurdity of the present regulation may be illustrated by suggesting a by-law on similar lines with regard to open spaces at the back of buildings. Imagine the London Building Act amended by rescinding section 41, wherein it is enacted that "There shall be provided in the rear of every building an open space exclusively belonging to such building, and of an aggregate extent of not less than 150 square feet." Having rescinded this definite regulation to follow the example of the London County Council, Parliament would enact a section in the following terms:—"An open space in connection with a new building shall, whenever practicable, be provided in the rear of such building." The permission such a regulation might give for the erection of back-to-back dwellings would not be taken advantage of by anyone concerned in the

erection of buildings which could be described as claiming to be in any way associated with sanitary architecture, and it is to be hoped that the by-law which permits buildings to be so designed that it is impracticable to fix a soil-pipe outside of them will not be taken advantage of by any who may be looked upon as worthy workers in the art and craft of building.

Our design must provide for secure foundations, for reliable damp-proof courses at suitable levels, and on all the lower floors it is desirable to have solid floors bedded on concrete. Externally care should be taken to provide for the underside of all projections being throated to protect the walls from wet. Copings, sills, tops of cornices and other projections should be weathered, *i.e.* sloped to drain water off, and where the material is not impervious it should be covered with lead or other metal, or with slates, tiles, or a rendering of cement trowelled to a smooth face. String-courses must not be considered as merely ornamental. When properly constructed they serve to protect the walls from wet.

The wood sills of window frames should be sunk and weathered, and where bedded on stone sills should have metal tongues to keep out wet. Cased window frames with double-hung sashes should have a rail between the sill and the lower bead as protection from rain driven under the sash and to admit of the lower sash being raised some inches, to secure ventilation without draught in the lower part of the room through the meeting rails of the two sashes. This is a better method than the practice of putting in a slip of wood below the bottom sash. Solid frames with casement sashes are best with the sashes hung to open outwards, and for purposes of ventilation it is always desirable to have opening fanlights above the casement sashes.

On the upper floors great care should be taken in the construction of the hearths for fireplaces, and perhaps the best plan to adopt is to fix a steel or wrought-iron cambered box with solid concrete to receive tiles or other facing to the hearth. The box to have a flange screwed to the trimmer and to have a bearing between two courses of brickwork in the chimney-breast.

To secure a water-tight roof attention must be paid to the inclination where slates or tiles are used, and where flat roofs are constructed especial care must be taken that the structure is of sufficient strength to prevent sagging or settlement, whether finished with concrete or asphalt or covered with lead or other metal. A slight sagging or settlement with pitched roofs covered with slates or tiles might be of little or no detri-

ment to the building, but would be very serious with all kinds of flat roofs.

With detached houses all drains should be external to the building. In cities where houses are in terraces and the sewers in the public roadways, the drains are often of necessity under the buildings, but in no case should there be junctions under the building, and there should be an inspection chamber on each side of the building in the open air, to admit of ready access for examination and testing the drain under the building. Inspection chambers are also desirable at all points where it would be necessary to have access to the drains for a thorough examination and test.

Drain-pipes are made of stoneware, concrete and iron. Except where a reliable foundation cannot easily be secured stoneware must, I think, always retain its superiority over concrete or iron, as when well-glazed and of sufficient strength, it fulfils all the requirements of a perfect drain. It is impenetrable by air or water; it permits of perfectly air-tight and water-tight joints being made between pipe and pipe, so that the drain when finished may be practically one pipe; it is imperishable in use, and can only be destroyed by breakage. The floors of inspection chambers should be entirely of stoneware where the drains are of stoneware, and of iron where the drains are of iron. Good work, however, may be done where the channels only are of stoneware or iron, as the case may be, with the benchings formed in cement, but it is better for the entire floor, channel and benching to be of the same material as the drain.

All connections with house drains should be outside the house, and the only pipes which should be directly connected to house drains are soil-pipes and ventilating-pipes. Rain water, waste water, and surface drainage should pass into the house drain through some kind of trap, of which there are many varieties.

Arrangements for providing a free passage of air into drains on the house side of outfall traps, to form an air brake or disconnection between sewers and house drains, are now admitted to be necessary by all sanitary authorities; indeed, the principle involved in their use is the cardinal principle of modern sanitary architecture. By means of the outfall syphon trap, with an air inlet which when near to buildings should be above all windows, and outlet ventilation above the roof, a building is thoroughly protected from the ingress of sewer air. That it is important that the admission of sewer air to our dwellings should be prevented is universally admitted, even

THE MAY-OATWAY FIRE ALARM

Simple, Inexpensive, and Reliable.

Licensed by H.M. Postmaster-General.

St. Dunstan's Church has just been seriously burned, and it may be the turn of St. Paul's or Westminster Abbey next. Serious injury by fire is now unpardonable. The May-Oatway Fire Alarm insures discovery in time to prevent loss or fatal consequences. It detects the fire, calls the nearest Fire Brigade, and all helpers, and points out the seat, extent, and course of the fire automatically, whether the building is occupied or not. Architects and builders invited to inspect. SIR EYRE M. SHAW (late London Fire Brigade), Chairman. SIR W. H. PREECE, Consulting Electrical Engineer. 53 New Broad Street, E.C.; 40 Victoria Street, S.W.; and Merryweather's, Limited.

when no infectious disease germs are present in the sewers, but it is often a matter of life and death. Who, indeed, would be bold enough to assert that the miles of London sewers into which every house is supposed to drain in this great Metropolis, with its five millions of inhabitants, are ever free from infectious disease-germs? These sewers drain alike the palace and the worst tenement-dwelling in which poverty and ignorance breed disease and invite death. With perfect house drains, properly disconnected from the sewer, the inhabitants of a town-dwelling may enjoy the blessings attendant upon cleanliness; but without such disconnection from the public sewer the cleanest possible household must share the dangers resulting from the sins of others against the laws of health.

In ordinary practice the ventilation of house drains can be effectively secured by continuing the soil-pipes up to the roof full bore. As I have already said, wherever practicable—and in all new buildings, of course, it is practicable—soil-pipes should be fixed outside the building; for ordinary buildings, where economy in cost is specially to be considered, strong iron pipes have an advantage over lead, inasmuch as that, while for all practical purposes they are as good, they are less expensive, and are less liable to be injured by ladders, &c. In cases where the first cost is not one of the principal considerations, of course, strong lead pipes should always be used. All iron used in sanitary work should be protected by galvanising or by a coating of Dr. Angus Smith's solution.

Sanitary authorities are not agreed about the use of cowls in connection with drain-ventilating pipes; while some recommend them, others dispute their use. There can be little doubt, however, that whether cowls are or are not useful in special cases, they are not necessary for the ventilation of house drains. A 4-inch ventilating pipe, open at top, well above the roof, with the sides perforated near the end, is a simple and effective outlet ventilator.

To those who may be entrusted with the duty of supervising the erection of buildings it is important to secure the intelligent co-operation of the whole of the workmen. The supervisor should regard each man as an intelligent craftsman, responsible for the quality of his work, and in a measure for the success or failure of the structure on which he is engaged.

How important the work of sanitary architecture is to the community I cannot better emphasise than by quoting some words of the late John Erichson, F.R.S., president of the Royal College of Surgeons, when addressing a meeting of the Sanitary Assurance Association.

Mr. Erichson said:—"We all know that the sound mind in the healthy body is the greatest of all blessings; but in order that the mind may be sound the body must be healthy, and for the health of the body it is necessary that the body should in its daily occupations be surrounded by influences that are, at all events, not detrimental to health. These truths are so self-evident at the present day that they scarcely justify repetition, for if there is any one circumstance which appears to me more specially to distinguish modern civilisation, it is the attention that is being paid by the educated classes to the laws and to the study of hygiene. There is nothing, I take it, that more distinguishes the civilised man from the savage, or the educated man from the man who is unenlightened, than the scrupulous attention that the civilised and educated man pays to what is, after all, the first law in hygiene—cleanliness in all the actions of his body and all the surroundings of his home. The culture of the civilised man inclines him to it. It becomes almost instinctive. The knowledge acquired by the educated man compels him to it, for if there is one truth that is more determinedly established by modern science than another it is this—that a vast number of those diseases which devastate mankind are preventable, and being preventable and not prevented, they are self-inflicted. And it is not only those more fatal diseases—the typhus and the typhoid and the plague and the diphtheria—that are so preventable, and that constantly, by want of prevention, we inflict upon ourselves; there is also a vast host of the minor diseases that tend to sap greatly the strength and to diminish the happiness of existence."

On the same occasion as that on which the late President of the Royal College of Surgeons made the remarks I have quoted, Sir Joseph Fayrer, M.D., F.R.S., said:—"I have become aware of what a great and crying want this sanitation of dwellings has become. I know and see constantly how people suffer from the want of it, and it has been always a marvel to me, in the present state of culture, intelligence and education, how people can have remained so blind as they do remain to the evils that surround them. My firm belief is that it is from want of appreciation of the nature of the causes that produce these evils that proper remedies are not applied. Many people, not seeing in their own household what is happening, therefore do not believe it. It is consequently necessary that knowledge should be spread abroad. If people came really to understand that foul emanations come from drains, and that the water we drink, if connected with that

with which we flush our sewers, will cause typhoid fever, sore throat and all the train of diseases, they would insist on sanitary architecture."

In conclusion, let me express the hope that what I have said on some of the main principles of sanitary architecture will be of service, will lead to thought on matters of detail connected with the design and construction of sanitary buildings for all sections of the community, and do something to raise the sanitary standard in the homes of the people.

BITUMINOUS PAVEMENTS.*

ALL forms of bituminous pavements, whether manufactured from natural or artificial asphalt, are in fact artificial stone pavements. The industry started with the use of the natural rock asphalt from the mines in the Val de Travers, Canton Neuchâtel, Switzerland. The mines were discovered in 1721, but it was in 1849 that its utility as a road covering was first noticed. The rock was then being mined for the purpose of extracting the bitumen contained in it for its use in medicine and the arts. It is a limestone found impregnated with bitumen, of which it yields on analysis from 8 to 14 per cent.

It was observed that pieces of rock which fell from a waggon were crushed by the wheels, and under the combined influence of the traffic and heat of the sun a good road surface was produced. A macadam road of asphalt rock was then made which gave very good results, and finally in 1854 a portion of the Rue Bergère in Paris was laid with compressed asphalt on a concrete foundation. In 1858 a still larger sample was laid, and from that time it has been laid year by year in Paris. From Paris it extended to London, being laid in Threadneedle Street in 1869 and Cheapside in 1870, and in successive years in other streets. It has also been extensively used in Berlin and other cities on the Continent.

The early success of the asphalt pavement in European cities led American contractors to seek the manufacture of an artificial asphalt which would have similar qualities, and the first idea was to utilise the tar produced at the gasworks, which was then almost without value. The result was about twelve to fifteen compounds, varying only in detail, being all essentially composed of tar or coal-tar pitch and sand, forming an

* A paper read before the League of American Municipalities by Fred J. Warren, Boston.

artificial sandstone. Large quantities of these pavements were laid in Washington and other cities between 1870 and 1874, the stone pavements on Fifth Avenue, New York City, being surfaced in this manner. A large number of cities, especially in New England, use this artificial mixture successfully on sidewalks, and the coal-tar sidewalk continues to be in greater use in Massachusetts than all other forms combined.

The result on street work was a general failure, and the impression has since generally prevailed that coal tar or its products are entirely unsuitable for roadway construction. The work was done at ridiculously low prices by contractors who had no previous familiarity with the construction of bituminous pavements or incentive to improve, and, in fact, at the time the pavements were laid no one in this country or Europe had any accurate knowledge of the requirements necessary to produce good work. A few of these pavements, however, are in use to-day even on roadways, and have been in use longer than any asphalt pavements in existence in this country or in Europe. I think all failures can be traced to the use of inferior grades of coal-tar, improper methods of preparing the cement and the use of improper sand in the wrong proportions.

The early failure of the artificial asphalt pavements put them almost entirely out of use in roadway construction. A German chemist, Professor de Smedt, had secured a patent on a formula for making a bituminous surface, using natural asphalt as a cementing material. Experiments were made with Mexican, Cuban and Trinidad asphalt; the so-called Albertite, Gilsonite and other bitumens found in this country were also tried, but generally without success. Small samples of the Trinidad Lake asphalt pavements were laid in Newark, N.J., and in New York City in 1870 and 1871, respectively, but it was not until 1876 that a pavement was laid on a large scale.

Chemists generally knew that there were physical properties in asphalt which made it impossible for them, by any chemical test, to determine the durability or utility of any given asphalt, and no city could be induced to adopt this form of pavement until, from actual test, it had stood in Fifth Avenue in New York, with an average daily traffic of 13,000 vehicles, for several years.

In 1876 Pennsylvania Avenue, in Washington, was in an almost impassable condition, being covered with a rotten wooden pavement. Congress directed its repaving, and appointed a commission consisting of General H. C. Wright and General Q. A. Gillmore, of the Corps of Engineers, and

Ludgate Circus, London, E.C.

Edward Clark, architect, to have supervision of the work. The terms of the law directed them to lay the best-known pavements. They advertised for proposals, making no restriction as to materials. They received forty-one proposals, for every variety of stone, wood, macadam and bituminous pavements. Out of them all the commission selected two, and laid these respectively on two-fifths and three-fifths of the avenue. These were the natural rock asphalt from Neufchatel and the Trinidad Lake asphalt mixture. Both pavements were completed in the spring of 1877. The Neufchatel pavement lasted ten years, while the Trinidad Lake mixture was not resurfaced until 1890.

After 1876, under the present permanent form of government, the asphalt pavement has become the recognised pavement of Washington. It has spread from Washington to many other American cities, Buffalo taking the lead, with something over 300 linear miles, Philadelphia and New York City also laying large quantities each year.

Many other forms of asphalt have from time to time come on the market, and have been laid with more or less success. The physical differences which existed in the new varieties of asphalt have made it necessary for their promoters to develop new formulæ, and to endure many poor pavements laid during experimental stages and under close competition.

It seems to be a fact that the early asphalt pavements caused as much annoyance to the promoters as did the early coal-tar pavements, but they were generally laid at a good margin of profit, under a guarantee system which justified and encouraged the most careful methods and immediate repair of defects; and considering the complications presented in the manufacture of the bituminous surface it is to the credit of the established paving companies that they have succeeded in laying asphalt pavements so satisfactorily.

As late as 1885 some of the pavements laid by the most experienced companies were complete failures when first laid, and the cost of repairs during the first five years sometimes amounted to twice the original cost of construction of the wearing surface, while the average cost of the most experienced companies for the maintenance of pavements laid since 1890 will hardly average 5 per cent. of first cost of surface during the first five years, and the pavements are frequently in perfect condition without repair at the end of that period. When it is considered that a slight variation from the proper proportions of ingredients brings about disastrous consequences, the improvements are quite remarkable.

Probably the greatest failures were due to improper selection of the sand or mineral grain. Sands which careful analysis show to be very different are frequently so closely alike in appearance that the most expert eye could not detect the difference. There was no record kept of the nature of the sand until recent years, almost any sand being considered suitable.

The bitumen is used to surround the grains of mineral matter for the purpose of cementing them together. In the Richardson patent formula, used in the Trinidad Lake pavement, the mineral grain is so fine that the aggregate surfaces of the grains to be coated approximate 1,000 square inches to each cubic inch of the wearing surface, and the coating of bitumen around each grain is about one four-thousandth of an inch in thickness.

If the sand is not of such graded sizes that the voids are approximately filled by the bitumen used, then on exposure in such minute particles early failure is quite certain, on account of evaporation and decomposition. A slight variation in the size of the grains makes a great difference in the area of grains to be coated with bitumen, and in turn, in the thickness of the coating when a given proportion of bitumen is used, and consequently upon the length of time which it would take to change its physical condition on exposure. So great is the difference that a given bulk of sand, of an even size, passing a No. 200 screen, contains about thirty times as much surface to be coated as does the same bulk standing between a No. 10 and No. 20 screen, and about 1,000 times as much surface to be coated as does the same size of grain passing a 2-inch screen and standing on a 1-inch screen. In the effort to duplicate the Neufchatel pavement, the entire development and practice has been to exclude from the bituminous mixture all mineral grains coarser than about 1-20 inch in diameter.

A form of bituminous roadway known as tar macadam has been used in England with very variable results for more than thirty years, and also in a few American cities. The process employed is defective in principle and does not accomplish uniformity. I feel that there is little permanent merit in the use of crude tar, or in coating stones of even sizes laid in courses, with an effort to roll the several courses together, as the very life of the bitumen depends upon its proper selection, preparation and use, in proper proportions, with a dense mineral mixture.

Considerable investigation has convinced me that both practices are wrong, and that the future development of bitu-

minous pavements will be along the line of using a coarser mineral aggregate than is used in the asphalt pavement, and more modern methods than employed in tar macadam.

The advantages of a coarse grain are:—First, the coarse grain gives rigidity in itself not acquired by fine grains, and also gives a surface that will not wear slippery. Second, it is, therefore, possible to use a softer cement, which will have longer life. Third, a heavier coating will be secured around each grain, which will tend to increase the life of the bitumen if exposed. Fourth, the voids can be greatly reduced, thereby avoiding exposure of bitumen in minute particles. Fifth, lower temperatures can be used in mixing, and consequent saving in fuel and labour. Sixth, less danger of injuring the bitumen by overheating in the process of making cement or mastic.

The mixture to be used in any particular piece of work should always be determined by experts who will recognise the conditions present and the special treatment necessary, as the complications are many. Under proper instruction failures should be reduced to a minimum.

A pavement constructed on above principles would be a bituminous-concrete pavement, as distinguished from the bituminous-mortar surface of the asphalt pavement.

Owing to the nature of the mixture, I think the best forms of coal-tar, properly treated, will furnish the best form of bituminous cement for such a pavement. The coarse stone used should be the hardest procurable, and I can see no reason why, under proper development, the bituminous cement will not bind the mineral matter together until the stone itself wears out, under moderate traffic. I should not advise placing such a pavement on the heaviest-travelled streets of large cities at the start. It would be best to develop perfection under more moderate usage.

I think the term bituminous macadam is a suitable name for such a pavement, as it contains all the good points of a first-class macadam road, with durability and cleanliness added, and owing to the coarse grain it is not as slippery as other forms of bituminous pavements.

An equipment of 3,000 dols. to 4,000 dols. in machinery would be sufficient to lay 300 to 1,000 square yards per day of bituminous macadam, and municipalities under proper supervision could do the work themselves much cheaper than by contract. The largest sample of pavement laid on this plan is in the city of New Bedford, Mass. Lowell, Mass., has also borrowed a plant to construct 5,000 yards or more, and Holyoke, Mass., has tried a block, and seems well pleased.

The city of Pawtucket, R. I., was the first Eastern city in recent years to try the use of tar on its streets, doing the work itself under an old formula, but has recently had a sample of bituminous macadam laid on the above plan. Mr. Carpenter, the city engineer, was not satisfied with the lack of life of his first work, but he accomplished better results than others who have experimented on their own account.

PERSIAN CARPETS.

IN the last report of the British Consul-General at Tabriz on the trade of the province of Azerbaijan, he refers to the local manufacture of Persian carpets, and says it is a most interesting sight to see the looms at work. Eight or nine boys, whose ages range from eight to twelve, sit in rows at the looms, and with the wool, which they pull from reels suspended above them in their left hands, and a flat knife, crooked at the point, in their right, dash, with three movements, the thread through the web strings, hook it into the desired knot, and cut off the surplus ends, starting another knot before the spectator has realised what has been done. Having been shown the design and colouring of the carpet they are to work for the first 2 or 3 feet, these boys rely on their memories for the remainder of their task, for on only two or three looms is the design of the carpet to be seen affixed, and then only in plain pencilled drawing. When nearing complicated parts or medallions, a boy aged from twelve to fourteen, the foreman of the loom, who has the design seemingly imprinted on his mind, walks up and down calling out in a quaint sing-song manner the number of stitches and the colours of the threads to be used. A copy of the famous carpet from the Mosque of Ardabil, which is now at the South Kensington Museum, is being made in Tabriz. The design, flowering and colouring of the original are said to be unique, and here, although the boys were working without the design and at the rate of from thirty to thirty-five stitches a minute, a careful comparison of the hand-painted copy of the original showed the most minute attention in every detail. Nothing but handwork is employed in the manufacture of Persian carpets and rugs, and none but natural or vegetable dyes are used, and it is to this that Persian carpets and rugs are supposed to owe their reputation and lasting colours, although it is said that the secret of the beautiful dark-blue dye used in the older days has been lost. The dyes in general use in Persia are cochineal, madder-root, indigo, yellow-berries, yellow-root, walnut, and pomegranate husks and gallnut.

The Architect.

THE WEEK.

Two important decisions have been given by the Court of Appeal in respect of the 30-feet height which somehow has found its way into the Workmen's Compensation Act, and the measurement of which there is no determining by any instructions contained in the clauses. In both cases the appellants were builders. One occurred in London, the other in Manchester. Messrs. CUBITT & Co. had contracted to take down a house in William Street, Knightsbridge, and to alter one adjoining it. For the demolition a sub-contract was entered into with a housebreaker, one of whose men was killed in the operations. When the accident occurred the walls were only 11 feet in height with the exception of the party wall, which was over 30 feet. The action was taken against Messrs. CUBITT & Co. by the widow of the man who was killed, and she was awarded 273/. Messrs. CUBITT appealed. Their counsel contended that the demolition was no part of their trade or business, and at the time the building was no more than 11 feet in height. The Master of the Rolls in giving judgment held that it was part of Messrs. CUBITT's business to demolish buildings, although for their own convenience they might employ a sub-contractor, and they were consequently undertakers in the sense of section 4 of the Act. As to the height of the building there was no doubt a substantial part of it, viz. the party wall remained, and was over 30 feet in height. There was consequently evidence in favour of the award of the county court judge.

THE second appeal was brought by Messrs. NEILL & SON, of Manchester, and turned on the question whether the height was to be measured from the level of the street or from the footings. At the time of the accident in question the height of the brick building from the bottom of the footings above the concrete foundations to the top of the building was 33 feet 2½ inches; from the top of the footings to the top of the building, 31 feet 2½ inches; from the basement floor to the top of the building, 29 feet 10 inches; and from the level of the street to the top of the building, 23 feet 5¾ inches. The judge of the Manchester county court considered that the proper measurement was from the bottom of the footings, which gave a height of 33 feet 2½ inches; he therefore awarded compensation to the applicant. The Master of the Rolls considered that all the mischief contemplated by the Act might arise though the greater part of the building was below the level of the ground or street. The fact that part of a building was below the level of the ground did not prevent it being over 30 feet in height. Probably the footings were covered in, but he could see no evidence that there was more than a flooring at the top of the footings. The presumption was that the flooring at the time of the accident had not got beyond that stage. In his opinion therefore the height of the building must, in this case, be measured from the top of the footings, and being so measured, the building at the time of the accident exceeded 30 feet in height. The judgment will remove some serious doubts. Hitherto it has been decided that measurements shall be taken from the floor of the basement, but some lawyers have considered that the outside ground level was contemplated by the Act. In neither case will the Manchester building be found to be within the prescribed height. Whether the new judgment is to be taken as generally applicable it would not be prudent to assert.

In the proposal of the County Council to apply for Parliamentary powers to make subways under the new street from the Strand to Holborn we have a recurrence to the example of the Metropolitan Board of Works. Indeed, one of the causes of the disfavour which attended the Board arose from the apprehensions of shareholders of the gas and water companies that their property was about to be seized. The lawyers contended that if the pipes were once placed in the subways the Metropolitan Board of Works could exercise proprietary rights over them. Consequently there was no compulsory power given to the Board by Parliament, and the money expended on con-

structing subways beneath Garrick Street and Southwark Street was wasted. It remains to be seen whether Parliament will in the next session take a broader view of the necessities of London and will not permit the companies to place their pipes near the surface, a position which allows of continual meddling with the roadway and interruption of the traffic.

AN appeal has been issued by the treasurer of Guy's Hospital for the sum of 180,000/., which is required for a renovation and building fund. "Guy's" was established in 1724 by a London bookseller, and he was able to secure a lease for 999 years of the land on which the hospital stands at a rent of 30/. On his death he bequeathed to the governors 210,499/. The appeal of six years ago produced 250,000/., one-half the sum that was then required for re-endowment. The buildings, however, which served in an earlier age are now insufficient and unsafe. Moreover, with 230 nurses a special home is required. It has been estimated that no less than 180,000/. is needed for the completion of the nurses' home, laundry, the provision of a central heating and lighting system, the extension of the casualty department, provision of open-air balconies and sanitary blocks to surgical wards, the renovation of wards and other works (not including the remodelling of the out-patient departments). None of the proposed works can be considered as more than essential requirements, but although the plans for them have been prepared they cannot be undertaken until a liberal response is given to the treasurer's appeal.

THE picture entitled *The Duchess of Devonshire*, and which in parts, at least, is the work of GAINSBOROUGH, can now be seen at Messrs. AGNEW'S gallery in Bond Street, with some other works. The sums received for admission will be given to the Artists' Benevolent Institution. Those who can recall the picture as it was exhibited a quarter of a century ago must admit that its escapade has not improved its appearance. The canvas has been shortened by about 16 inches in length and 18 inches in width, and it has not in consequence the suggestion of a gallery picture which it retained when put up for sale at CHRISTIE'S. When first seen in public it was accepted as the Duchess of DEVONSHIRE, but since then doubts have arisen. It does not recall any other likeness of the lady, who was as famous for beauty as for eccentricity, and no record of works by GAINSBOROUGH has been discovered by which it can be verified. In that respect, however, it corresponds with many famous pictures, and its value as a work of art is not diminished because there are doubts about the subject.

AN interesting report on explorations in the city of Mexico has been sent to the Anthropological Society of Vienna by Dr. EDWARD SELER. The city stands in an extensive plain, a part of which consists of large lakes, one of which is only about 3 feet lower than the Great Square of the city. Some of the lakes are brackish. The town was at one time liable to inundations in winter, and dykes were erected for protection. When CORTES and the Spaniards attacked the old Aztec capital it was situated on small islands, which were connected by large dams. CORTES destroyed the houses of the inhabitants in order to fill up some of the canals, and, in fact, no more regard was given to buildings and their contents than to the lives of the natives. No one of the ancient cities of the world was more thoroughly destroyed than Tenochtitlan. Care has been taken by the authorities that in modern exploration nothing will be broken or stolen which has archaeological interest. The scene of the operations is in proximity to the cathedral. The ruins of what appears to have been one of the towers of a temple have been found. From the quantity of human bones it is evident that sacrifices were offered on a fearful scale, with men as the victims. A figure of the god QUETZALCOVATL, in the form of a caryatid, and also a crouching figure of a fire god, with several other deities which remain to be identified, have been met with; vessels of clay and copper, golden plates and other examples denote the skill of the metal-workers. Altogether the results are creditable to the Aztecs, and form evidence of the civilisation they had attained.

THE SOCIAL POSITION OF ARCHITECTS.

ALL who have read Mr. ROBERT HICHENS's "Flames" are likely to have concluded that the writer was one with a brilliant career before him as a novelist. He could not be described as a master of character-drawing and development, but success of that kind sometimes only arrives after long practice. Where Mr. HICHENS was happiest was in the representations of the surroundings amidst which his people lived. In other words, the furniture, pictures, decorations and properties in general were more suggestive of the true artist than his men and women. It was easy to suppose that with sufficient money such a luxurious flat as that in Victoria Street was possible, and could be altered according to the varying moods of the occupant; but the reader was not convinced that the occult scenes which took place in the room, with the exception of the illuminations, were historically true. A writer with so much ability as Mr. HICHENS possesses is liable to the temptation to produce the class of work which is easiest for him, and in his last tragic extravaganza we have an example of what we may call his system carried to excess. There is no doubt that the reader's risibility is seized and he is compelled to enjoy the ridiculous occurrences in spite of himself. In that way the "Prophet of Berkeley Square" resembles its predecessor "The Londoners." In both if we seek for amusement we must allow prominent parts to be taken by furniture and other accessories, and they are in fact of more importance than the human dramatis personæ.

Like the Needy Knife-grinder, Mr. HICHENS can say he has no story to tell, but we may outline how some of the misadventures arise. The prophet, who is a Mr. HENNESSEY VIVIAN and about thirty-eight years of age, lives with his grandmother in No. 1,000 Berkeley Square. He has taken up astronomy, but prefers the practical to the mathematical interest of the science, and he has succeeded in foretelling a fall of snow. Then he attempts to study the horoscope of his aged relative, and finds she is destined to meet with an accident which he announces to her. He is so much alarmed that he writes for an interview with Mr. MALKIEL, the inspirer of the marvellous prophetic almanac, in order to have the conclusions verified. He meets that gentleman in a back room in Shaftesbury Avenue. Under the influence of the creaming foam of 4s. champagne MALKIEL becomes communicative to his brother prophet. He informs Mr. VIVIAN that his name is SAGITTARIUS, and that he lives in Sagittarius Lodge, at Crampton St. Peter, in the northern postal district. He cannot be known under his true name, because secrecy is indispensable for a prophet, but he has become tired of his false position or double life, and he resolves to go out of prophecy in a few years. His son and heir CAPRICORNUS is not destined for the prophet's vocation, but is to be an architect. According to the author:—"As MALKIEL pronounced the last words he flung his black overcoat wide open with an ample gesture, thrust one hand into his breast and assumed the fixed and far-seeing gaze of a man in a cabinet photograph. He seemed lost to his surroundings and rapt by some great vision of enchanted architects, busy in drawing plans of the magic buildings of the future ages."

To Mr. HICHENS it appears, we presume, no abrupt transition from prophecy to architecture; but an architect will be inclined to ask why the young genius was not to be made a writer of extravaganzas, a clergyman, soldier, doctor or lawyer? The reason is that Mrs. SAGITTARIUS had gathered round her "a very pleasant and select little circle, composed of architects and their wives." But the architects were not entrusted with the secret of how the funds were obtained for keeping up the establishment and its festivities. Mrs. HARRIS was not a more potent influence in Mrs. GAMP's experiences than the architects and their wives are in those of Mr. SAGITTARIUS. They are continually referred to. When he is told that his usual morning costume, including spats, is not exactly the dress for a dinner in Berkeley Square, he refers to the numerous dinners at which the architects and their wives were present, by whom no impropriety was seen in a frock-coat, and even the spats gained their approval. The unlucky VIVIAN is at last compelled to say that he will go mad if architects and their wives are again mentioned.

But he is still doomed to hear the expression under a variety of circumstances. If the architects were allowed to visit Sagittarius Lodge, it was because the owners, being in a false position, could not expect to attract a higher class of guests. But no sooner does the almanac-maker's wife discover that society has a weakness for prophets than "the architects and their wives began to seem to her uplifted fancy little better than the circle that frequented Hagglin's Buildings or appeared at the paltry entertainments given by the inhabitants of Drakeman's Villas."

All this is very silly, still, as in an old-fashioned pantomime, there are occasional if distorted glimpses of truth. It cannot be concealed that speaking generally architects are less favoured visitors in what is now called society than writers of romances, painters or sculptors, and one of them is not thought to impart professional dignity to a drawing-room like a physician or a barrister. Architects are usually believed to be wealthier than the majority of painters and sculptors; but there is less attractiveness about them, and although their knowledge is of use it has not the mystery of the physician's or the gravity of the lawyer's. Only a few days or nights ago we find the President of the Irish Institute of Civil Engineers pleading for the recognition of architecture as a learned profession. Whatever may occur in Ireland, it will require a great many after-dinner speeches to bring about that consummation in England.

If we ask how is it that such a state of things exists, the answer may not be readily forthcoming, but some of the causes can be indicated. What have been called "the classes" take summary and prejudiced views about the qualities of those intervening between them and the masses. They hear that architecture is taught in art schools, mechanics' institutes, polytechnics, &c., and they arrive at the conclusion that an education which is to be obtained at nominal charges, if not gratuitously, is hardly deserving to be accepted as professional, and does not of necessity make gentlemen. A magistrate or a county court judge who listens to lawsuits in which a few pounds are claimed as fees cannot help believing that an architect is on a level with the humblest class of medical practitioner. Men who have to be satisfied with such petty rewards as are revealed in the majority of actions for the recovery of fees must expect to be taken by the world in general as only fitting to participate in such gay and festive scenes as arise in places like Sagittarius Lodge.

Judged from the financial point of view, which in our time is regarded as the most important, the architect cannot compete with the civil engineer. Architects rarely obtain commissions outside their own country, and English architects least of all, while the civil engineer is treated as a cosmopolite, and sometimes he can claim the credit for colossal works costing millions of money in all parts of the world. He may belong to foreign Orders, and be accepted as the technical adviser of foreign Governments. In comparison with a power of which the influence is felt thousands of miles away, the architect with his modest villas and village churches and shops and schools must seem only a humble person in the eyes of society. Every thing with him appears on a small scale. On that account people who are acquainted with engineers, or who invest in foreign enterprises on the strength of an engineer's name, must be amazed at the outcry which arises whenever any public building is proposed, for it is supposed to be no more than the clamouring of competitors for the work. Engineers do not express their apprehensions whenever a railway or a harbour is contemplated, and what is still more remarkable, builders do not attempt to vindicate indirectly their individual claims to a contract. Architects alone exhibit their grievances when they are not assured of a commission, not thinking of the interpretation which is placed on their appeals and the injury consequently inflicted on the whole profession.

It was long ago pointed out by Sir GILBERT SCOTT that the bane of architecture was the mutual scorn of those who practised it. In the years which have passed since he delivered the address containing those words, it cannot be said there is any alleviation of the consequences of the relations which are peculiar to architects. It is only when a man receives a gold medal from the Institute or after his death that any words in praise of his works are heard. His friends may pay a tribute to him as a good fellow, but that

is merely to suggest the difference between the man and the architect. The criticisms get abroad, and a country reporter when he describes a building generally considers it is wiser to omit any reference to its designer. Need we wonder if under those circumstances authors of tragical extravaganzas employ architects for purposes for which men of no other class are supposed to be so suited, by lowering them to the level of the MALKIELS and other worthies of the same class?

ENGLISH BUILDINGS, 1725-32.

THE diffusion of knowledge by means of books, newspapers, engravings, photographs and other modes of illustration has been fatal to a class of correspondence which used to be prized. In the seventeenth and eighteenth centuries scions of the leisured classes, when they travelled for pleasure, prepared a kind of diary for the benefit of relatives or friends. The information conveyed in it would of course depend on the character of the writer. The story of "Eyes and No-Eyes," which at one time was popular, suggests a lesson which was exemplified by those old-fashioned diaries. Some writers preferred to relate what they heard, and the tittle-tattle with which they filled their communications still forms entertaining reading. Other writers, however, described what they saw which possessed interest for them. Lord HARLEY, who was the son of ROBERT HARLEY, first Earl of OXFORD, belonged to the latter class. His father, who was the associate of BOLINGBROKE, and afterwards his rival, acted for several years as Queen ANNE's Prime Minister and Lord Treasurer. After the Queen's death, OXFORD and BOLINGBROKE were impeached, but the latter fled to France and HARLEY was compelled to stand his trial alone. He was acquitted by the House of Lords, but ever afterwards—that is from 1717 to 1724—he lived in retirement. He was a great collector, and his son, having been brought up among books, pictures and other objects which were thought to be evidence of good taste, could hardly fail to have more interest in buildings and art than the majority of the fine gentlemen who were his contemporaries. The first tour by Lord HARLEY, who was afterwards to be the second Earl of OXFORD, consisted of a journey from London to Canterbury, while a second journey, undertaken in 1725, extended from London to Scotland and back. A third diary relates to travels in 1732. We have, consequently, in the diaries much information about churches and other edifices at a time which is a blank for most topographical writers.

His first journey commenced on August 26, 1723. His lordship with his friends and servants were mounted. Although the party consisted probably of fifteen men the route to be taken was kept secret, owing no doubt to fear of highwaymen. The servants with the horses left Dover Street and turned down by Buckingham Wall towards the Horseferry. The palace at Lambeth was visited, but was not much appreciated. HOLBEIN's portrait of Bishop VAREHAM was characteristically declared by the cicerone to be 800 years old. The route then lay by Greenwich to Dartford. In the church at the latter town they saw many monuments of antiquity, but most of the brasses and their inscriptions had been stolen. Lord HARLEY, who appears to have made a study of heraldry, was often disappointed through the vandalism of brass hunters. The interior of the church had been repaired, and was said to be very neat and handsome. Outside Dartford they saw a cricket match, a game "which of all the people of England the Kentish folk are most renowned for, and of all the Kentish men the men of Dartford lay claim to the greatest excellence."

On entering Rochester they were struck with "one of the neatest bridges across the Medway," which had been erected at the expense of Sir ROBERT KNOLLES. The cathedral was thought to look very poorly and desolate. As usual, the brass plates had been removed from the tombstones. They also visited WATTS's Charity, the interest in which was revived by CHARLES DICKENS. It offered bed and board for one night and a groat in the morning to all needy travellers, except to those who were contagiously diseased, rogues, or proctors. The roads of the district

in those days barely sufficed to allow two single horsemen to pass without very great inconvenience, and the narrowness was said to be required "to make amends for the great havoc that is made of their soil all along the banks of the Thames by the dealers in lime, who convey it in great quantities from hence for the support of the London builders, so that in this sense those traders may be said as properly to carry 'Cantium in Londinum,' as ÆNEAS did 'Ilium in Italiam.'" Near Ospringe they visited Jugg's Folly, so-called because the big residence was so costly, it was the cause of the ruin of the owner of the powder-mills at Faversham. The town of Faversham was reached at half-past seven, so the journey from London was rather slowly performed. The town, we are told, sent no members to Parliament, but "seems as factious and as full of discord as if it did." In the church they saw the Isles Monument, which was erected by a man who was once a poor boy in the town, and who left 20s to the sexton, who had to expend two bottles of oil every year upon the railings of the monument. The party safely arrived at the Red Lion in Canterbury, but the account of the visit to the cathedral and other churches of the city is not forthcoming.

In May 1724 the second Earl of OXFORD succeeded to the title, and on April 10, 1725, his lordship set out on a new journey northwards. The party went by Caxton, Huntingdon, Stilton, Stamford, to Belvoir Castle. The Derbyshire marble seen in some tables was much admired. It was described as chocolate colour, interspersed with white. In Ancaster Church several ancient flat stone monuments were irreverently utilised for the coping of the churchyard wall. One bore the inscription, "Priez pur le Alme Sire Joh. Dolman, Chivaler." The lettering was in a metal resembling brass, and fixed into the stone by nails. In the neighbourhood of Lincoln oxen as well as horses were at that time used for ploughing and the drawing of conveyances. The cathedral was found to be "in a very poor condition, and has all the tokens of entire ruin approaching. They told us Mr. GIBBS [the architect of the church of St. Martin-in-the-Fields] had been lately there to view it, in order to think of some method of securing it against an utter desolation, and that the first thing the chapter designed to do was to pave it, which I thought but an odd conceit to prevent the tumbling down of the tottering roof and pillars. The chief spire was blown down in Queen ELIZABETH's time, and has never since been put up again; the other two were blown down of later years. There have been some new ones put up in their places, but are very ill-proportioned and much too small for the height they are placed at." The palace was reported to have been burned down by OLIVER CROMWELL in 1643, and a few weeks before Lord OXFORD's arrival an old organ-blower was living who remembered the building previous to the destruction. The city in 1725 must have been in a wretched state, for ruin and desolation met the eye everywhere throughout it. The diarist writes:—"Though the ruins are so many here that one would think it could hardly suffer more, yet they find means every day of letting matters go further to wreck, and there is a parish church, St. Michael's, very lately fallen to pieces and so much neglected that nobody will so much as take care of the bells which lie in the ruins, and the very cathedral itself, if not immediately taken care of, may not improbably be seen converted into a heap of rubbish by some who are already born."

After visiting Sherwood Forest, Clumber, Welbeck and Worksop, the travellers came to Doncaster. The parish church, on which Lord GRIMTHORPE so vigorously operated at a later time, was considered to bear some resemblance to St. Mary's at Oxford; the inside was well fitted up. The writer adds:—"The tower stands about the middle, has no spire, and on the angles of it all the way up are some juttings out in the similitude of horns, as if meant for people to climb up by them on any emergent occasion, or perhaps they may have been meant by the architect for a mere ornament which I do not understand." The travellers bear testimony to the good order in which they found the cathedral at York. A man was employed cleaning the outside walls, who was said to have devised a chair for that purpose which he could fix wherever he pleased. The nave was used for promenading in after

evening service in summer time as the substitute for a park, and to meet the public convenience a benefactor had the stone seats covered with wood. A building of another class was inspected with interest. It was not until 1775, or fifty years afterwards, that JOHN HOWARD began his crusade for improvements in prison life. But in 1725 what is called a very handsome, commodious building, which had been lately erected, was to be found within the precincts of the castle. It is described as so "very open and convenient that it must doubtless very much contribute to the health of the poor creatures who have their dwelling-place there, and it were to be wished that all the counties in England would be induced to follow this example, which would be a very great piece of public charity, and would redound to the health of all those who are near them as well as of the prisoners themselves." The next remarkable building noticed is Castle Howard. One of the wings had not been completed, but it was said "the whole may be easily known to have been under the direction of VANBRUGH. There has certainly been great expense laid out here, and is generally thought not to have been less than four score thousand pounds. There is some Derbyshire marble spread up and down the house, which looks very well, and a great deal of stuccowork that looks very ill and mean." Lord OXFORD does not appear to have been an admirer of VANBRUGH, and he could hardly have enjoyed the friendship of SWIFT and POPE without being adverse to the architect and his works. Subsequently we read of the arrival of the party at Durham. In spite of the wealth of the princely see the cathedral was said to have made only an indifferent appearance, as the stone had been worn away by the weather. The interior had been recently whitened when the visitors saw it.

After passing through the Border country, the travellers were disappointed with their first experience of Scotland. But the notes confirm what is often asserted in SCOTT'S novels about the excellence of the wine which was to be found at the inns. In Haddington, for instance, the host is stated to have been a surly, scolding, drunken, peevish sort of man, but had "admirable good claret." At Dunblane the cathedral struck them as a very handsome church. "The west part of it lies now all in ruins, excepting the walls and pillars, which are still standing. The east part of it is covered in, and makes the 'paroch kirk' for the Presbyterians." Over a century and a half had to elapse before this fine building was secured against destruction. Scotland in 1725 must have been very bare, but the owners of the ground had shortly before commenced to plant, and the difference between the planted and unplanted parts was very striking. The travellers were surprised by the appearance of Perth, and especially by the new Free School, with its upper master who received a salary of 30*l.* a year sterling, an under master paid 20*l.*, and two ushers who received 10*l.* each. The boys were evidently kept in awe, for, unlike those in English schools, not the least hacking or scratching by them could be seen on the benches. St. John's was as much of a puzzle to the travellers as it is in our time. The diarist says:—"The church here was designed for a much larger building than it is at present, but how the progress and finishing of it came to be interrupted I do not learn. As it is at this time it contains two distinct preaching places under its roof; that at one end of it is very lately fitted up, and contains a much less space than that at the other end, but those new seats will hold a very large congregation, being so contrived as to have no room for those that sit in them to kneel at their devotions, which is thought to be too great a compliment to be paid to the Almighty in this part of the world, as likewise to be uncovered in any part of their devotions."

At the period of Lord OXFORD'S visit many of the Scottish proprietors were absent owing to the troubles which followed the rebellion of 1715. One was the Earl of MAR, who had proposed to convert his old house into as excellent a habitation as could be found in Scotland. We are told that "his gardens which he designed and laid out himself are at this time kept in tolerable good order, and in them we walked upon gravel which was brought thither from the pits at Kensington; it was taken in at London for ballast, and ships of a considerable burden (perhaps 500 tons) sailing up the Forth just by the end of his garden made

the expense not so very material as one would imagine, upon barely hearing that Kensington gravel was conveyed hither purely to make up the walks." It seems hardly credible that in Edinburgh in 1725 there were no inns, as in English towns, which could receive mounted travellers. It was the custom for people of fashion, if they remained in the city no more than a night, to lodge in one house, have their meals in another, and to allow their horses to be accommodated in a third place. The Earl of OXFORD and his friends accordingly supped at Mrs. DON'S, commonly called "Lucky Donne," in the High Street, an eating-house of good credit; lodged at Mrs. SCOTT'S in the same street, and their horses were put up at stables. The travellers were surprised at seeing houses from ten to fourteen storeys high; but in Parliament Close the fourth or fifth storey was occasionally on a level with the street. Holyrood was described as being very handsome and noble, and very fit for the residence of a prince "were it completely furnished." The time was not favourable to see Scotland at its best, for after ten years the effects of the insurrection were to be found in neglected estates and farms. It must have been with satisfaction they found themselves again in England.

The eighteenth-century archæologists somehow gained for themselves a notoriety for carrying off relics, and it is not surprising to find it stated that a Dr. MANGEY, a prebendary, conveyed from the wall near Hexham several stones with Roman inscriptions, which were the property of Lord OXFORD, to Durham. At the time the parish church of Hexham, which once was the choir of the old cathedral, was in a ruinous state, but 700*l.* had been collected towards its restoration. The monuments suffered violence equally with the church, and Dr. MANGEY was again mentioned in connection with the destruction. There were some who believed he made no scruple to beg, borrow or steal whatever he could lay his hands on, but he had a rival in the Bishop of ELY. Carlisle Cathedral was described as being in no better condition than the church at Hexham; the part converted to a parish church was in wretched disorder. At Penrith an inscription was seen which recorded the numbers of the deaths from plague, which were:—Penrith, 2,260; Kendal, 2,500; Richmond, 2,200; Carlisle, 1,196—terrible figures if we take into account the thinness of the population.

In 1738 we find the Earl in Chichester, and mention is made of the ancient cross and the spacious and noble cathedral. "Some ancient paintings behind the screen" were not worth his notice, for they are no more than copies of a pseudo-Germanic version of the early history of the building. In describing Winchester Cathedral, it is stated that the building, library and school were preserved from plunder by Mr. LOVE, who commanded under CROMWELL. He was educated at the school, and had then taken oath to preserve and defend it, and he had honestly kept to his word.

The Earl of OXFORD was severely critical upon some of the fashionable architects of his time. In writing about Rainham, the property of Lord TOWNSHEND, which is believed to have been designed by INIGO JONES, KENT'S alterations are condemned in the following words:—"The rooms are fitted up by Mr. KENT, and consequently there is a great deal of gilding; very clumsy over-charged chimney-pieces to the great waste of fine marble. KENT has parted the dining-room to make a sort of buffet by the Arch of Severus; surely a most preposterous thing to introduce a building in a room which was designed to stand in the street." Houghton, which was the seat of Sir ROBERT WALPOLE, the rival of the first Earl of OXFORD, is also judged with rigour, for we read:—"This house has made a great deal of noise, but I think it is not deserving of it. Some admire it because it belongs to the first Minister, others envy it because it is his, and consequently rail at it. These gentlemen's praise and blame are not worth anything, because they know nothing of the art of building or anything about it. I think it is neither magnificent nor beautiful; there is a very great expense without either judgment or taste. The two best rooms are the hall and the saloon, which take up just the depth of the house. The measure of the hall, as well as the plan of the house, are exhibited in that ignorant rascal's book called 'Vitruvius Britannicus,' the editor COLIN CAMPBELL; there is some small alteration, as the roofs of the towers, else it is exact."

It is further said "that the house after an alteration by GIBBS" is a composition of the greatest blockheads and most ignorant fellows in architecture. As the owners of Rainham and Houghton had been enemies of his father it would be expecting too much magnanimity if he were absolutely impartial in his criticisms. But in other places there was less reason to be biased, and what is said about the condition of cathedrals and churches can be taken as possessing more than the average amount of accuracy.

THE SURVEYORS' INSTITUTION.

THE first ordinary general meeting of the session 1901-02 of the Surveyors' Institution was held on Monday at 12 Great George Street, Sir John Rolleston, M.P., the president, in the chair.

The President, in the course of his opening address, said that the two distinguishing characteristics which marked the period of his professional career were commercial and urban prosperity and agricultural and rural adversity. The results of the prosperity of the towns had been, concurrently with good trade and employment, a considerable rise in value and an abundant market for those wares in the exchange of which the surveyor was so largely concerned. There seemed, moreover, every prospect of the continuance of this condition of prosperity. On the other hand, the man of the country had a different story to tell. The wave of prosperity, the flowing tide of progress which had swept over the country had not only passed him by, but had left him wrecked amongst the shoals, and for his parlous state the man of the city had neither pity nor concern. From the prince to the peasant the people of this country had ceased to consume, as a matter of course, the food products of the country; and his point was that the landowner and farmer, being deprived of the home market to so large an extent by the foreigner, and no other market being open to him, must begin to consider whether the production of food, on any extensive scale at least, was worth his while, and whether under the circumstances the land could not be turned to some other use, such as the extended cultivation of timber and possibly textile materials which were once grown to a considerable extent in this country. All schemes for the improvement of agriculture appeared to be devoted to the greater production of food which the people did not want when it was produced, and he could only suggest that the inventive faculties of mankind might in the future be directed to the discovery of some other purpose to which land might be profitably applied. He referred, of course, to agriculture as a trade, as a calling pursued with the expectation of gain, for the purpose of producing articles for profitable sale, and not to that class of agriculture which was followed merely for the sake of hand-to-mouth sustenance, and which afforded little or no saleable surplus. We had always been accustomed to hope for something better for the land than to see it become the mere habitation of colonies of needy squatters. Our ambition had been to see its cultivation a great and prosperous industry, employing vast numbers of people, breeding a sturdy and healthy race, and, with the aid of science, furnishing a maximum of production most useful to mankind. This would be progress, the other reaction. He saw no sign of progress, but had come to the conclusion that the prospects of British agriculture, so far as the production of food was concerned, were well-nigh hopeless, and that, while the consumer was content with comestibles which were not British, which were not the same as British, but which satisfied the appetite, there could be no improvement in the market for home products. But if the prospects of agriculture were gloomy they had to be faced, and there was double reason for the removal of any injustice which might lay upon the land. In this connection he discussed the Agricultural Rating Act of 1896, and dealt with the criticism raised against it. He expressed his approval of the Act, which he had always regarded as the first advance in the path of a great reform, although in itself it was but an act the barest and most meagre justice. If the Act needed any defence this might be supplied by the fact that two Royal Commissions, before the first of which he gave evidence, had reported on its principle, and that both had approved and recommended it. Among the Commissioners who indicted the words "That their statement will show that the policy of the Act of 1896, whereby land is rated at one-half, and which has been the subject of so much misrepresentation, was only a measure of justice which had been too long delayed," was the town clerk of one of the largest cities (Mr. H. Clare) and the town clerk of another large town (Mr. Stuart). It might, therefore, be supposed that the report had been sufficiently considered from the urban point of view, and that it needed no defence. The measure brought to the front at once the inequality in the incidence of rates as between real and personal property, and singled out the most glaring instance for adjustment. The

reference to the rating of personal property was, in his opinion, the weakest part of the otherwise excellent report of the Rating Commissioners. The Commissioners did not recommend the taxation of personal property. The investments of this country abroad probably amounted to three thousand millions sterling. This huge capital had been employed in the enrichment of other countries, and the possessors of the colossal income from it lived, most of them, in this country, used our roads, received the protection and the security which the country afforded and took houses in country parishes where the rates were low, and where under our system of local taxation the farmer paid the rates for them in a preponderating proportion. Their contribution to the local rates bore no proportion to their incomes, while the farmer's did, and he paid rates on an assessment which was largely in excess of his gross income. Was it to be wondered at that there was a growing feeling amongst rural ratepayers that property which was invisible and hidden away in safes and strong rooms should be brought out to bear its share of local taxation in a more equal degree with that which was visible and spread out before the eyes of every one? He pointed out further, that the liability of the rural ratepayer was by no means limited. The tendency for town people to settle in rural parishes raised the local rates, and in this and other ways the town sponged upon the country. He contended that if the adjustment or readjustment of the burden of taxation took the weight off a back on which it had been wrongly placed the effect of its redistribution could not be a subject of justifiable complaint. One of the chief causes of offence against the Act had been the claim of one of the great political parties and their supporters in the country that the money intended for the relief of the tenant went instead into the pocket of the landlord, contrary to the intention of Parliament. He believed such a contention to be absolutely unfounded. After a reference to the cultivation of timber as a valuable product, the President discussed among other subjects the nationalisation of the land, which he said would never appeal to surveyors as an object worthy of accomplishment; the nationalisation of water, which might commend itself more to their consideration; the establishment of small holdings, labourers' housing in the country and pure beer.

A vote of thanks was accorded to the President for his address, and the proceedings closed.

NATIONAL MEMORIAL TO QUEEN VICTORIA.*

THE following description accompanied the design by Mr. R. Rowand Anderson, LL.D.:—The plan of the Mall prepared by the Board of Works and sent to architects along with the instructions seems a good one, and I follow it generally.

Avenue.

The centre avenue on this plan is shown to be 70 feet wide. I increased it to 80 feet, with a 10-foot footpath on each side. The first line of trees and shrubs, where the statues are placed, I make 33 feet wide, then a secondary avenue on each side 27 feet wide, with a second line of trees and shrubs 20 feet wide, then the park railings. The total width is 260 feet, the same as on the Board of Works plan.

Preservation of Trees.

The two southernmost of the three centre rows of trees shown on the Ordnance Survey plan must be removed. The trees and shrubs on the north side can be preserved, and also most of the trees and shrubs on the two lines on the south side of the Mall.

Position of Monument.

On the Board of Works plan the centre of the monument to Queen Victoria is 345 feet from the palace wall. I make it 437. This admits of a freer exit and entrance for carriages from and to the palace.

York Stairs and New Avenue.

The only important alteration I suggest on the present lines of road is opposite the York Stairs. The present line of traffic curves round to the Horse Guards Parade. The position, plan and dimensions of these stairs suggest an avenue as a continuation. What I propose is shown on the general plan, and the result on a small, coloured, perspective view. As this is no part of the scheme, it is therefore only put forward as a suggestion.

Architectural Treatment of Monument.

In working out the architectural treatment of the project, I felt that the monument to Queen Victoria must be the keynote of the whole scheme. I have therefore given much study and thought to the production of a design worthy of so great a subject. After preparing a number of drawings, I found that they so inadequately expressed my ideas of such

* See Illustration.

a monument that I decided to prepare a sketch model which I submit along with my other drawings. In this design I have endeavoured to express something of the moral grandeur of the Queen's reign, and also the great national event which culminated at its close in the consolidation of the Empire. The Queen is the crowning feature. At her side is the British Lion, and her left hand is placed on its head, typical of the confidence between the throne and the nation, the result of the wisdom and noble life which characterised her long reign. On a stage immediately below the Queen is a circle of young lions typifying the growing colonies and dependencies of the Empire. On a stage below this are four female figures supporting a continuous wreath. These symbolise India, Canada, Australasia and South Africa. The background of these figures is covered with a suggestion of heraldic decoration. On the short stage below this are four bronze panels for inscription, which should have reference to her wise and beneficent rule and thought for all her people. Immediately below this is a space for the dedicatory inscription. This must be regulated by the space available, and must be easily read. The suggestion I make for this is:—"Erected by the Empire to commemorate the virtues and the greatness of Victoria, Queen and Empress, 1901." On the lowest stage of this part of the monument are four large panels, which I suggest should be filled with representations of the great Naval Review at Spithead and the Jubilee Procession of 1897, when representatives of the whole defensive power of the Empire assembled in London and swore allegiance to the Throne.

All this part of the monument is placed on a podium, with four projections serving as pedestals for four groups of figures. Two of these represent the defensive power of the Empire, the Navy and the Home and Colonial forces. They are treated, not in an active attitude of defiance, but in a calm attitude of defence. The other two groups illustrate the peaceful occupations of the nation. One is science, art and literature, the other agriculture, commerce and the industrial arts. The monument is then surrounded by a balustrade, with four

entrances to the space round it. The pedestal on each side of the entrance carry symbolical figures representing Fortitude, Justice, Truth, Temperance, Mercy, Concord, Prudence and Peace—qualities which may be taken to represent leading features of Her late Majesty's character, and also the characteristics of a great, powerful, but peace-loving nation, whose leading maxim is liberty and equal justice to all under her flag.

Dimensions of Monument and Materials.

The total height of the monument is 60 feet, and the diameter at the base 75 feet. The architectural part of the monument should be constructed of Pentelic marble, Istrian marble or Portland stone, and all the figurework in bronze. Pentelic marble, which is very durable and tones beautifully, would be the preferable one to employ.

Space in front of Palace.

The architectural treatment of the open space in front of the Palace is dictated, first, by the position and shape of the Victoria Monument; and second, by the two lines of traffic to and from Constitution Hill and the Mall.

The coloured bird's-eye perspective view of this shows the general arrangements in front of the Palace. The enclosing architectural features of this space might be varied. A colonnade is a possible treatment, but I do not feel that this would harmonise well with such a building as Buckingham Palace, and that it would diminish the importance of the monument, and the great cost of it would limit the expenditure on the other features of the scheme. I have, therefore, adopted the balustrade with larger pedestals at intervals for statues, and smaller intermediate ones for electric lamps. On each side of the Victoria Monument an enclosed space is formed in the centre of which I show a fountain. Alternatives to this would be a canopy over the fountain or a group of statuary.

Seeing that there are a number of statues on the line of the balustrade, I feel that fountains would give more variety and

play to the design. The statues on the balustrade should represent men of the Victorian period.

Berlin Processional Avenue.

In Berlin the Sieges Allee is laid out in the same way as is proposed here, a centre avenue and two side ones, separated from the centre by lines of trees. The architectural treatment at Berlin consists of sixteen semicircles on the outer side of each of the two side avenues. They are all of one size and plan, spaced at equal distances, the arrangement of the statues is the same in each, and they are all made of white marble. The effect is monotonous, and the marble used is so white that it does not tone with the surrounding foliage. In the plan I submit, I place the statues and other architectural features next the centre avenue, so that they may contribute to the general effect of a procession passing to and from the Palace. The architectural treatment of these statues would be varied, and would be either single ones or in groups.

I take advantage of Clarence and Marlborough Gates to introduce special features.

Historical Statues.

The arrangement of the statues between Marlborough Gate and the Palace illustrates historically the title of the present royal family to the throne. At Clarence Gate I place a statue of Alfred as representing the line of Saxon kings. On the other side of the road I place an equestrian statue of William the Conqueror, who, over and above his title by right of conquest, was a kinsman on his father's side of Edward the Confessor, eldest son of Æthelred, by his marriage with Emma, daughter of Richard the Fearless, Duke of the Normans. To the east of William the Conqueror I place Edward I., as representing the Plantagenets, who came to the throne through Henry II., son of Geoffrey Plantagenet and Matilda, the granddaughter of William the Conqueror.

To the west of William the Conqueror I place the House of Lancaster, as represented by Henry V., the victor of Agincourt, grandson of John of Gaunt, the fourth son of Edward III. of the House of Plantagenet.

Opposite Edward I. I place a group of statues representing the origin of the Stuarts, namely, Robert the Bruce, his daughter Marjory, and Walter the Steward, who married Marjory.

Opposite Henry V. I place a group representing the alliance of the royal families of England and Scotland—Henry VII. of the House of Tudor, his daughter Margaret, and James IV. of Scotland, who married Margaret.

Between this group and the Victoria Monument I place a statue of James VI. of Scotland and I. of England, as marking the period when the crowns of England and Scotland were united in one family.

Opposite this is a statue of George I., as representing the House of Hanover, who came to the throne through his marriage with the granddaughter of James I.

Opposite Marlborough Gate I propose a large semicircle representing one of the greatest periods of English history. In the centre of the semicircle is an equestrian statue of Queen Elizabeth, at the two ends of the semicircle are Burleigh and Shakespeare, the four intermediate statues representing Sir Philip Sidney, Sir Walter Raleigh, Howard of Effingham, and Drake.

Electric Lights at Marlborough Gate.

At this part of the Mall I set up four great electric lights, forming a square, and on the top of them I place the emblems of St. George, St. Andrew, St. Patrick and St. David.

Between this and the east end of the Mall I show where a number of statues, either single or in groups, could be placed, but it does not seem necessary in the meantime to name them.

Arch.

I place the great arch at the Spring Gardens entrance to the Mall, and at the corner of the Admiralty buildings. It is at this point that the roadway is deflected, and by placing the arch here the change will be masked.

In designing this arch I have avoided the Roman form, of which there are already examples in London, and have adopted the English type of Italian architecture. The upper stage of this arch is designed to provide a place for a royal and equestrian statue.

Electric Lighting.

All the balustrading at the Palace end of the Mall is provided with electric lamps, and four are shown round the base of the Victoria Monument. When all lighted up the effect would be very fine.

Along the Mall I place electric lamps on each side of the Central Avenue next the roadway, and one row of lamps in each of the side avenues.

At Marlborough Gate four great lamp pillars, already noticed, and on the Elizabethan semicircle electric lamps between the statues, and a large one at the dividing of the road opposite the York Stairs.

The Society of Arts will hold their first meeting on Wednesday next. Before Christmas papers will be read, "Leather for Bookbinding," by J. Gordon Parker; "The Identification of Wood and its Application to Scientific and Commercial Purposes," by Herbert Stone; "Aluminium," by Professor Ernest Wilson; December 18, "Range Finders," by Professor George Forbes, F.R.S.

The Committee of the Land Law Reform Association propose to hold a conference on Tuesday, December 3, at the Westminster Palace Hotel, to consider the questions of town and country housing in their widest aspect.

NOTES AND COMMENTS.

THE discoveries which have been made at Molino Fienzo, in the neighbourhood of Pompeii, would appear to be of unusual interest, especially as it is easy from the remains to imagine one of the incidents of the catastrophe of A.D. 79. The owner of an estate near the mouth of the river Sarno, being incited by the recent discovery of gold plate in another part of the district, decided to undertake excavations. It was not necessary to sink deeply before the ruins of a building were found. Whether it was simply a residence of some proprietor who carried on a variety of businesses or was a collection of shops has yet to be ascertained; but there is proof of the existence under the same roof of a dealer in wine, a joiner, a vendor of fish and a baker. Near the house was the road leading to the Porta Stabiana in Pompeii, and along which many of the scared inhabitants must have fled from the city. Between seventy and eighty skeletons, evidently those of a poor class of people, have been exhumed; the only coins they possessed were of copper. Under the verandah about twenty skeletons of men, women and children were discovered, and they all appear to have belonged to a better class, judging by the necklaces, wristlets and rings which they bore. On one was a chain of sixty-four links, two armlets and a heavy gold signet-ring, besides a dagger with an ivory handle in a fine sheath. Near the figure were some household gods. Up to the present no photographs have been allowed to be taken of the discoveries, and as the ground is private property there is difficulty in obtaining information. It should, however, be the duty of the Italian Government to obtain records of all the stages in the exploration and to preserve remains which must add a new interest to Pompeii.

A CURIOUS case has arisen under the Metropolitan Building Act. A Mr. ELLIS was lately summoned for having erected a new building beyond the general line of frontage in the street. He was convicted by Mr. D'EYNCOURT, and the demolition of the new building was ordered. The magistrate was asked to state a case, but declined on the ground that there was no question of law involved on which to seek the opinion of the High Court. Application was then made to a divisional court for a rule *nisi* for a writ of mandamus directing Mr. D'EYNCOURT to state a case. This was also refused. An application to the Court of Appeal was, however, successful. At the hearing which followed an objection was raised that the Court of Appeal had no jurisdiction to consider the matter because the proceeding was a criminal cause or matter. The Court allowed the objection as there was no jurisdiction, and the rule *nisi* which had been granted was accordingly discharged. The magistrate's order for demolition remains in force.

THE decision which was given in the Court of Appeal on Wednesday in *WARREN v BROWN* will help to remove one of the uncertainties relating to ancient lights. The plaintiffs owned a factory in Leicester which was erected in 1860, and was lately used for the production of hosiery. The defendant owned a building on the opposite side of the street, to which in 1899 he added some storeys, and, as was alleged, in that way diminished the light which entered through plaintiffs' windows. The action taken by the plaintiffs, in which they claimed to be entitled to the amount of light enjoyed for twenty years, was tried by Mr. Justice WRIGHT. His lordship found that the plaintiffs had suffered substantial damage, and he assessed that of tenant at 100*l.* and that of the owners at 200*l.*; but as the plaintiffs had an abundance of light left for all ordinary purposes of inhabitancy or business, he considered they were not entitled to the mandatory injunction claimed by them on the ground that their extraordinary use had not been interfered with. This conclusion was arrived at partly through consideration for public convenience. As his lordship said:—"Unless, indeed, there is some such limitation of the right to light

for ancient windows, it is difficult, as Lord HARDWICKE observed in *Fishmongers' Company v. East India Company*, to see how the ordinary extensions and improvement of towns could be carried on. If every house which has existed for twenty years is entitled to have all or substantially all the same light come to its windows as during the twenty years, no new houses could be built opposite to old ones unless at a distance which would impose on servient tenements an unreasonable burden, and might involve great public inconvenience." The plaintiff appealed, and the Court of Appeal reserved judgment until Wednesday. Their lordships said that Mr. Justice WRIGHT appeared to consider there was a standard of light, and that there might be interference with light so long as it was not brought below the standard. That was an erroneous view. Some houses became extremely valuable through having particularly advantageous ancient lights, and any substantial interference with them would cause great damage to the house. Lord Justice MELLISH had stated it was impossible for the law to say there was a certain quantity of light to which a man was entitled and which was sufficient for him. Their lordships therefore decided for the plaintiffs. The case exemplifies two theories which have their supporters among lawyers, and which turn on the extent to which general interests are to be admitted. If the case could be taken to the House of Lords, as it ought to be, there might be a confirmation of Mr. Justice WRIGHT's opinion.

THE Temple in Paris is not one of the places which of late years were comprised among the monuments or curiosities which every visitor was bound to see. It acquired notoriety in the First Revolution, which it is not well to have perpetuated. It will soon, however, pass away, like the great order of Christian warriors who once inhabited the fortress which stood on the site, and which was as large and important as the Louvre. The Municipal Council have at last determined on its demolition. Like all places where old clothes are exposed for sale without undergoing a process of disinfection, it became a possible source of danger, and even poor people kept away from the gloomy arcades. The ground would be well adapted for one of the magasins which are believed to bring happiness to the womenkind of Paris. The Municipal Council, knowing that apartments are still required in Paris, have resolved that the property shall not be sold in one lot, but in several. In case one company might purchase all the lots and then erect an immense building on them, it has been stipulated that under no pretext whatever is any communication to be formed between the buildings on the different lots, and the walls between them are not to be pierced for doorways.

FOUNTAINHALL CHURCH. MAY FIELD, EDINBURGH.

BUSH LANE HOUSE, CANNON STREET, E.C.

THIS block of professional and commercial offices is situated a few yards from Cannon Street station. The elevation has been carried out in red bricks with Portland stone dressings; while the entrance, which forms the subject of the illustration, has been executed entirely in Portland stone. The building has a frontage to Bush Lane of about 115 feet, and comprises six floors, containing ninety-six rooms, served by a stone staircase and a passenger lift. There are ranges of water-closets and lavatories on each half-landing, and the whole of the floors are fire-resisting and the entire building is lighted by electricity. The contractor was Mr. HENRY LOVATT, and the architect Mr. DELISSA JOSEPH, F.R.I.B.A.

STAINED GLASS IN ENGLAND SINCE THE
GOTHIC REVIVAL.INCLUDING SOME ACCOUNT OF ECCLESIOLOGICAL
PROGRESS, FROM 1860 TO THE PRESENT TIME.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays
among The Glories of France," &c.

(Continued from page 266.)

THE parcelling out of the old unwieldy parish of Haggerston into more manageable districts, and their provision with churches, originated with several munificent persons. Mr. Richard Foster, at that time resident in Upper Clapton, always to the fore in the cause of church extension, "floated" the scheme with several thousand pounds, while Robert Brett, then churchwarden of St. Matthias, Stoke Newington—a church founded by his devotion and completed on so grand and com-

ST. CHAD, HAGGERSTON, FROM THE N.E.
(James Brooks, Architect, 1867-69.)

plete a scale by his indomitable energy and perseverance—executed the work very considerably, not only by the proceeds of such manuals as "The Doctrine of the Cross" and "The Churchman's Guide to Faith and Piety," but by issuing appeals recorded in such a manner as only he knew how. The result, then, of these joint efforts was the completion in 1865 of St. Michael's, Shoreditch, and of St. Saviour's, Hoxton, in the year following; of St. Augustine's, York Street, Hackney Road, in 1867; of St. Chad's and St. Columba's, Haggerston, in 1869; and of St. Stephen's, in the same parish, in 1872.

Although St. Michael's, Shoreditch, and St. Saviour's, Hoxton, should, as earlier works of their architect, be examined before his two Haggerston examples, the latter may be more conveniently visited first on leaving St. Mary's, assuming the ecclesiologist to have made that interesting early effort of Mr. Brooks's skill his *point de départ*.

St. Columba's and St. Chad's having several features in common, it may not be inappropriate—confining our attention to the most prominent points in these two remarkable buildings—to describe them in face of each other, indicating the

points of strong likeness and equally strong dissimilarity existing between them.

Their construction in red brick, a material to whose exigencies their design is in a great measure subordinated, and the employment of a very Early Pointed of a French type, are perhaps the two most striking points of resemblance these churches bear one to another. Both are cruciform, but their transepts projecting little, if at all, beyond the line of the aisles, neither St. Columba's nor St. Chad's appears so on the ground plan.

Externally this is not detrimental to the general effect, the transepts being sufficiently dimensioned to insure an air of simple quiet dignity, while inside they impart an appearance of grandeur and spaciousness without appearing mere useless excrescences.

In the two churches under review the cross form has, however, been differently worked out.

At St. Columba's the crux is groined for a central tower, which, as may be seen by reference to an illustration of this church in *The Architect* of February 15 last, rises but little above the roofs.

Here the four tower arches, carried on slender banded shafts, constitute one of the most telling internal features of the church; but at St. Chad's they are absent, provision being made for the bell at the intersection of the four limbs in a timber turret of open character, having a short quadrilateral spire of slates.

Probably the extreme awkwardness attendant upon roofing the crux when the central tower is absent led Mr. Brooks to minimise the cruciform character of St. Chad's by prolonging the nave roof across his transepts, while permitting them to open into the nave by graceful arches on slender attached shafts, which, reaching as they do almost to the top of the clerestory, detract somewhat from the length of the church.

The late William White, in his remarkable church of All Saints, Notting Hill—described, it will be remembered, at some length in an earlier number of these papers—carried the nave arcade boldly across the transepts, superimposing it with an open arcade. In this instance, however, the transept roofs gable out from that of the nave at a much lower level, whereas, as at St. Chad's, they are equal in dimension.

The two-bayed chancel of St. Chad's terminates in a semi-circular apse of graceful sweep, the whole being vaulted in red brick. At St. Columba's—the most noble and imposing of this group—the tower forms the chancel, the eastern limb which "gives" so grandly upon the Kingsland Road being used exclusively as a sanctuary.

This is square ended, but by giving its brick vaulting a double cell, and by causing its ribs to start from a slender shaft between the two eastern lancets, Mr. Brooks imparted to it a quasi-apsidal character somewhat after the style of St. Cross at Winchester or St. Honorine at Gravelle, near Havre. The lierne vaulting, both in St. Columba's and St. Chad's, is very peculiar, in that carrying out the idea of stilted the architect did not commence his vaulting till a height of from 10 to 15 feet above the wall-plate had been reached, thus gaining so much additional height. To counteract the thrust of this vaulting thickness of wall was alone relied upon, no buttresses being used either to chancel or nave, even in cases where, as at St. Columba's, there is ample unoccupied space on the site, and where many architects would have used them, if only to break up the long unfenestrated aisle walls.

The form of vaulting used in these two churches requiring but little centreing, there was a considerable saving in the cost of groining, and the face of the spandrels being, as observed just now at St. Columba's, slightly curved, each course of bricks forms a kind of arch from rib to rib.

The extremely domical section of the sanctuary vaulting at St. Columba's causes the central boss to totally disappear when the visitor is but a short way down the nave, and this, together with the size of the cells, contributes to diminish the appearance of length about this portion of the church. Here the whole space eastward of the nave is groined, the transepts barrel-wise, with stone ribs sprung from slender attached shafts. Of great beauty is the vaulting of the south chancel aisle at St. Chad's, which, having an apsidal termination

forms a spacious chapel for the daily offices. This, one of the earliest examples of a most useful and nowadays indispensable appendage to a large town church, does not appear at St. Columba's, which, from its size, would appear to have had greater claims upon its employment, but conditions of site doubtless stood in the way.

A small chapel fitted up beneath the organ loft in the south transept having, it is presumed, felt to be inadequate to parochial needs, a third altar has been erected at the west end of the south aisle immediately opposite the principal entrance to the church, which is through a transept commensurate in width with the last bay of the nave, a feature serving not only to break up the outline of the church very agreeably but also the purpose of a baptistery. Besides this, it constitutes a very dignified approach to the interior, creating that effect of space at the west end so desirable in a large town church. The trellis-like pattern formed of brickwork on the western wall is characteristic of its architect.

St. Chad's is entered from the west by a lean-to narthex with inner doors placed eccentrically, outer ones north and south, and small foliated circlets in its western wall.

Coming now to the feature that imparts such character to a church's interior, the nave arcade, we find that in St. Chad's having an inner order of stone, perfectly simple, and an outer one of brick, springing from low cylindrical columns, rather stout, but with very thin capitals as yet in the block. In the chancel the arches are entirely of stone, and rise from massive circular columns with sculptured caps—a strange square block with an incised cross on each face occurring just at the spring of the former.

At St. Columba's the five nave arcades, moulded entirely in red brick, are of the most graceful curve, and agree happily with the stone piers which, suggested probably by those in St. Pierre aux Corps at Bourges, are of the "compound" type. Their four slender shafts, disposed around a cylinder, are just detached from, though connected with it, by bands cut from a single stone, all the capitals being as yet *en bloc*. Mr. Brooks's treatment of his responds was an extremely clever and graceful, and at the time of the inception of St. Columba's, nearly forty years ago, a novel one, composing them as he did of red brick, and crossing them at the intervals marked out by the rings on the slender attached shafts with stone bands. The nave aisles of both churches are destitute of windows, being spanned, at St. Columba's, by half arches of brick brought down upon corbels and spacing out panels destined for pictorial enrichment. Light, therefore, is depended upon from the clerestory, which in both instances is an exceedingly grand feature, the windows being large ones of two uncusped lancets, with a large foliated circle treated plate-tracery wise. At St. Columba's the clerestory windows are placed regularly above the arcades, the most western window on the north side being unglazed, so as to look into the transeptal narthex above alluded to with captivating effect. At St. Chad's, where the clerestory windows are grouped into two pairs, but not ranging with the voids or supports of the three bays below, a pair of the same type of window lights the west front above the narthex, St. Columba's being closed westward by two tiers of lancets. Composing a fenestration of much grandeur, they are not a little reminiscent of some Early Pointed Yorkshire work.

For either transept at St. Chad's a triplet of lancets surmounted by a plate traceried rose is employed, while the northern arm of St. Columba's derives its light from a triplet of windows, miniatures of those in the clerestory, and surmounted as at St. Chad's, by a rose.

Throughout the chancel of both churches the large single lancet prevails. Of these there are nine in the clerestory of St. Chad's, the three serving for the apse being filled with remarkably fine stained glass by Clayton & Bell. The Session in Majesty within the central lancet—rivalling in its tinctures and ensemble some of the finest productions of the thirteenth century—was in position at the consecration of the church in April 1869. The effigies of the Blessed Virgin to the left—inserted by the Marys of England in response to an invitation from the daughter of the late venerable vicar, Rev. W. R. Sharpe—and that of St. Chad to the right are both

later insertions and equally meritorious. All these windows, to which the size of the figures filling them imparts a much more striking appearance than a multitude of small subjects treated medallionwise, must be seen to be appreciated.

At St. Columba's, the stained glass in the pair of lancets at the east end is by other hands and not satisfactory, the best vitreous decoration in the church being in the small circle which surmounts the two tiers of western windows and in the two lancets which light the north-western transept above the doorway—all by Clayton & Bell. The iconography of the glass filling the latter, and setting forth the Fall and the Atonement, is curious.

Thus, commencing at the bottom, in the left-hand lancet we have the Creation of Eve—a somewhat difficult subject—paralleled by the Nativity. Eve offering the forbidden fruit to Adam typifies the Temptation. The Expulsion from Paradise is placed side by side with the Procession to Calvary, while the Sacrifice of Abel balances the Crucifixion. The manner in which the groups composing this interesting series are arranged in squares, and not within foliated or vesica-shaped medallions, is worthy of notice—treatment which, while it has the merit of novelty, diminishes to a considerable extent that idea of verticality which the old mosaic arrangement invariably secured for

ST. COLUMBA'S, HAGGERSTON, INTERIOR LOOKING EAST.
(James Brooks, Architect, 1867-69.)

windows of this age of Pointed. Be this as it may, the bold employment of grisaille, the brilliancy of the tinctures, and the clearness with which the groups stand out, give these two lancets at St. Columba's greater claims upon the admiration than many a more ambitious work in which colour has been lavishly supplied.

Those who take the trouble to study these two striking and abnormal churches will easily discern that the qualities mainly insisted upon in their capacity of town churches have been solidity of construction and a general air of religious impressiveness. Upon elaborate detail, either inside or out, little has been expended, yet, despite their dignified severity, the architect contrived to infuse into them just the right spirit of originality which enabled them to appear neither commonplace on the one hand nor bizarre on the other.

With regard to their fittings, a bit at a time and done well has been the order both at St. Columba's and St. Chad's, starving the roof-tree to gild the altar being in either case apparent.

Tall, light chancel-screens and parcloes are, however, in both churches desiderata, though preparations for the former have in either instance been made in the shape of a low wall, pierced at St. Columba's with rather large quatrefoils, and faced at St. Chad's with trefoil-headed arcades, the upper parts of which have a species of tracery formed of three small circles, and the lower strips of coloured tile. From insufficiency of data, it is not possible to say whether the surmounting portion in each case is to be of wood or metal, though the substantial character of the bases seem to point to the latter. In the former material Mr. Brooks has given us several interesting specimens of his ideas respecting this important item in a church's furnishing, and in a style quite *sui generis*, as for instance in the two churches presently to be passed in review, St. Andrew's, Plaistow, and that of the Annunciation, Chislehurst. The screen in St. Matthias, Stoke Newington, imparting the fifteenth-century idea of a *cancellum* with paintings on its base and doors, translated, so to speak, into the Pointed of two centuries earlier, was, if I mistake not, Mr. Brooks's earliest work of this kind, but it labours under the fault of being a little too early for the style of the church, while the upper portion not being sufficiently "ouvert au jour," as our vivacious neighbours across the Channel would say, is perhaps open to criticism.*

At St. Chad's the reredos is completed, at St. Columba's only partly so. In either instance it is raised upon a stone base relieved with that species of trelliswork in thin strips of green tiling which was so favourite a method of decoration with the architect. In this portion of the reredos at St. Chad's a trefoil-headed niche is introduced comprising piscina and credence, thus obviating a good deal of passing to and fro on the part of the server, besides being very convenient for the celebrant should he by any chance be deprived of such assistance at the holy table.

The St. Columba reredos is in two stages, the one immediately above the altar presenting a series of small trefoil-headed niches, and the upper one five rather wide compartments also trefoiled and gabled. These latter are intended for pictorial enrichment, the application of which will do much to modify the somewhat heavy appearance at present worn by the composition.

In the reredos at St. Chad's—a most graceful but modest work, illustrated in *The Architect* of June 21 last—sculpture takes the place of painting, its stilted central compartment being filled with a group of the Crucifixion, flanked by effigies of those present at it, viz. Joseph of Arimathea, the Centurion, St. Mary Cleophas and St. Mary Magdalene. This and the reredos in the neighbouring church of St. Augustine may be taken as examples of how differently architects and sculptors of eminence can manipulate such a feature.

EGYPT EXPLORATION FUND.

A GENERAL meeting of the Egypt Exploration Fund was held on the 7th inst. in the rooms of the Society of Antiquaries. The president, Sir John Evans, was in the chair.

The treasurer's report stated that while in the last two years there was an excess of expenditure over income in the case of the fund proper, this year there was a very substantial balance. This was due to the generosity of friends on both sides of the Atlantic. First, in the exploration fund the total disbursements had been 2,351*l.* 1*s.* 8*d.*, which was made up as follows:—By the expedition account 1,443*l.* 2*s.* 10*d.*. This amount was incurred on the work alone at Abydos, under Professor Petrie, as M. Neville was unable to carry out his proposed task at Deir-el-Behri. By publications they had spent 565*l.* 1*s.* 11*d.* The total receipts over the same period had been 3,788*l.* 11*s.* 8*d.* Next came the archaeological survey. The total disbursements of the survey during 1900-01 had been 523*l.* 6*s.* 5*d.* The next account was that of the Græco-Roman branch, in which the payments had amounted to 1,016*l.* 16*s.* On the three funds there was thus an increased

balance on last year's account of 1,791*l.* 1*s.* 1*d.*, the relative figures being 5,597*l.* 6*s.* 4*d.* as against 3,806*l.* 5*s.* 3*d.*

The President in his address said that losses by death had not been so numerous as in previous years. They were, among others, Sir John Henry Greville Smyth, of Ashton Court, near Bristol, who contributed most liberally to the Fowler Fund for excavations at Tunis, and was for many years a subscriber to the Exploration Fund; Mr. Arthur Cates, the well-known architect and architectural adviser to the Woods and Forests; and Mr. Joseph John Tylor. The scene of operations had during the past season been in the main the same as last year—near Abydos, on the site of the royal tombs. There, notwithstanding the previous researches of M. Amélineau and other explorers, Professor Flinders Petrie had been able to reap an abundant and valuable harvest. It should be added that two royal tombs of the third dynasty had also been explored, and that Mr. MacIver had found much of pre-dynastic and first dynasty remains at El-karab, while Mr. A. C. Mace had continued his work among eighteenth-dynasty tombs at Abydos. Mr. J. Garstang, working for the Egyptian Research account, had found in a cemetery of the sixth and seventh dynasty some fine alabaster vases, a gold chain and other interesting objects. The share of the spoil which was allowed to come to England was, in accordance with former precedents, exhibited during the month of July at University College. They had reason to be thankful to the museum authorities at Cairo for the equitable if not, indeed, liberal manner in which the produce of their excavations had been divided between themselves and the fund. The whole collection exhibited last summer at University College had now been divided mainly between the United Kingdom, including her colonies and the United States of America, but portions had also been assigned to some European States, the principle of division adopted being that each country should, so far as possible, share *pro rata* in accordance with the amount that each had contributed to the fund. In addition to Part II. of the royal tombs a special extra publication of the fund had been produced by Professor Flinders Petrie, with some little assistance from Mr. A. C. Mace. It was entitled "Diospolis Parva, the cemeteries of Abadiyeh and Mû," and gave an account of their examination in 1898-99, illustrated by nearly fifty plates, among which there are several of the highest importance. Another publication of the fund, which would now shortly appear, was "The Temple of Deir El Bahari," No. IV., which would comprise plates 87 to 110, relating principally to the Temple of Hather and the Southern Hall of Offerings. The wall-paintings were of great interest and the long religious texts subsequently incorporated into the Book of the Dead were worthy of notice, especially as M. Neville had offered a translation of one of them which somewhat differed from that of other authorities. The Archaeological Survey had, during the past year, produced two volumes, one of which, however, was only on the point of being issued. The first of these, "Ptah-hetep," Part II., was presented to subscribers to that branch in June last. The second was a detailed account of the rock tombs of Sheik Said, prepared by Mr. N. de Garis Davies, though the spot had already been visited by Professor Petrie, Mr. Griffith, Messrs. P. and J. Newberry and Mr. Carter, whose works are mentioned and some of them utilised. The tombs, according to the list, were 102 in number, and belonged in the main to the ancient kingdom. With regard to the Græco-Roman branch, the report was less satisfactory, though the volume of Fayoum papyri had for some time been in the hands of subscribers. The examination and publication of Lord Amherst of Hackney's fine collection was a grave undertaking, and the editors, Messrs Grenfell and Hunt, were to be congratulated on the completion of their work. It was to be hoped that ere long the work on the Oxyrhynchus papyri would be resumed. There was, he was informed, a large fragment of a lost comedy, very likely by Menander, among those that were still unpublished which was sure to prove of the highest interest. Messrs. Grenfell and Hunt would probably return to the Fayoum in the course of next month with the view of making further discoveries of papyri. He wished incidentally to mention the remarkable discoveries of new forms of extinct mammalia that had been made in the lower tertiary deposits of Egypt by Captain H. G. Lyons and his staff. He was glad to say in conclusion that Messrs Thomas Cook & Son had most kindly and liberally agreed to insert a prospectus of the fund in every ticket that they issued to travellers in Egypt. The Society of Biblical Archaeology had also issued their prospectus to all their members. Apart from America, subscribers last year were 700 in number; this year they were 721. Might they still increase, and even in larger proportions.

The Hon. Secretary said that from an administrative point of view the chief feature of the past year had been the strengthening of their connection with the United States. The two old affiliated branches of Philadelphia and Chicago were now both represented on the committee by Americans—Major Cassatt, military attaché at the Embassy, and Mr. Louis Dyer

* The writer once heard that this screen in St. Matthias, Stoke Newington, was originally designed for St. Stephen's, Lewisham—a graceful Early Pointed work of Sir Gilbert Scott's in a Northern French edition of that epoch—and to which it would have been better suited. An illustration of the screen at Stoke Newington appeared in *The Architect* of November 3, 1899, and of that in the Church of the Annunciation, Chislehurst, in the number for June 21 of the present year.

who was as well known at Oxford as at his original University of Harvard. From the Boston office they had received this year the equivalent of 10,000 dols., instead of 6,000 dols. last year. It must always be borne in mind that these liberal contributions from America were frankly sent in view of a return in the form of antiquities and papyri for American museums and libraries. In accordance with their rule of following strictly the proportion of local contributions, the American share had been divided between five great museums—at New York, Boston, Philadelphia, Pittsburg and Chicago.

Professor Petrie then delivered the following address:—
This year we have the satisfaction of completing the most important historical work that has yet come into our hands. The continuous order of seventeen kings has been established, and the very foundations of Egyptian history have been settled in a manner which had hitherto seemed entirely beyond hope. The royal cemetery of the tombs of the kings at Thebes, belonging to the eighteenth-nineteenth dynasties, and that of the pyramid builders at Memphis, of the fourth-sixth dynasties, were the only series of royal tombs yet known; and neither of those had added anything to the history which was already fixed by other monuments. But the recovery of the royal tombs of the earliest dynasties has given us not only another royal cemetery, but has provided the only contemporary history of their time, and completely vindicated the historical character of the lists which had been preserved by later ages. The criticism of myths had told us that Mena, the founder of the Egyptian monarchy, was but a form of Mena, the law-giver of India, and of Minos, the hero of Crete; and to hope for tangible monuments of his time was but seeing castles in cloud-land. Now the long line of a dozen kings back to Mena is clear before us; we have seen and handled the gold, the crystal, the ivory, with his name and engravings, and even the kings which went before him are better known to us by actual objects than are half the Saxon kings of England. No such complete materialisation of history has been obtained at one stroke from any other country or age. And such a result was least to be expected from ground which had been pronounced exhausted, the last clearance of which unhappily had just been made before our work there. That previous clearance had not restored a single detail of the succession of the names, nor identified the historical position of a single king. It had only swept away the great part of the materials, and left a chaos of destruction behind it. The whole of what we have covered by our work was from the overlooked residue which had escaped all the plunderers; that invisible margin was the total of what we had to use, and that hundredth of all that had existed there has sufficed to reconstruct the historic fabric. So difficult is it to really destroy history that we may now say that our methods—which will doubtless be improved—can resuscitate knowledge of a period of which the remains have been destroyed time after time by zeal and greed. By the use of a trained body of workmen, who had been taught in past years to notice and preserve the objects in their work, we recovered a far larger amount of material than we had hoped for. The splendid bracelets of gold and jewels, the gold bar of Mena, the gold sceptre, the gold-capped vases were beyond all expectation; and the more instructive remains include about twenty engraved tablets and dozens of fragments, five royal tombstones and 150 private tombstones, over 200 different sealings, nearly 100 inscriptions on stone vases, 800 stone vases restored and many hundreds of small objects of the greatest interest as illustrating the civilisation. Altogether in the two volumes issued to you there are over 500 photographs, over 2,000 drawings, and nearly 2,000 marks, beside the full and detailed plans and sections of the whole of the tombs. None of this mass of material, which alone has enabled us to restore the earliest dynasties, would ever had been known had we been content to leave the subject where the common routine of excavation had already abandoned it. You see before you on the largest scale an object-lesson on the futility and destructiveness of a mode of work which was no worse than the greater part of what has been perpetrated in Egypt in the name of excavations during the last 100 years. Now there awaits us yet the great temple site of Abydos, the ground of the earliest temple, that of Osiris. It has been largely dug over for earth, and some monuments have been removed, but the lower levels of it are yet untouched. It seems that this was probably the burial-place of the head of Osiris, the great relic which drew around it the burials of the historic times, and probably also was surrounded by those of the earliest dynasties, as one such grave has been found there by accident. The site is a very large one, about 500 feet by 1,000 feet, or three times the size of the whole of Trafalgar Square and its roads, and it will have to be turned over 12 feet deep. If we get a third of that, or as much as Trafalgar Square, turned over in the course of a season, that will be as much as one can expect, so that some three years will be occupied in undertaking this great site. It is in that ground that we may hope to find tombs of the earliest historic time, and carvings in stone and ivory of the primitive kings, like those

from Hierakonopolis. Our treasurer must appeal to you to insure that this most promising site of all Egypt is thoroughly and finally explored. It is now twenty-one years since I first began work in Egypt; Mariette then ruled and this fund was yet unborn. In these days the pyramid of Khufu was our boundary of history, nothing whatever was known of the archaeology of Egypt as a comparative science, and no trace of Europe in Egypt was thought of earlier than the Ptolemies. The situation now is completely different. The monumental history has been carried back to the very beginning of the written record, which has been entirely confirmed, and beyond all that, the whole course of the prehistoric civilisation has been mapped out for perhaps 2,000 years more completely than has been done for such ages in any other land. The archaeology is better known than that of the most familiar countries, not a vase nor a bead, not an ornament or a carving, but what falls into place with known examples and can be closely dated. The connection with Europe has been led back to the beginning of Greek records, then to the Mycenaean times, next to the twelfth dynasty, and now even to the first dynasty, and Egypt is the sounding-line for the unmeasured abysses of European history. No such opening of new fields to the mind has come to pass since the days when the Renaissance scholars burst into the world of lost classic authors; even the surprising unfolding of Assyria and Babylonia lacks the historic completion of the Egyptian record, and is still almost untouched in its archaeology and development. We cannot expect the next twenty-one years to be as potent as that which we have seen, for the great outlines are now laid down, but many a dim passage in the long course of the history yet awaits the light, and it will be the duty of the new century to fill in, as far as possible, the details of the picture which has been sketched in the last few years.

AMERICAN OFFICE-BUILDING ELEVATORS.*

WITHOUT an efficient elevator service the office building is a failure; yet, notwithstanding the many elevators which have been installed, the elevator service causes the operating engineer and the manager of the building more anxiety than any other single item of the installation.

Each tenant of the building must be carried at least four times a day, and provision made for the outside public. The transportation should be as rapid as possible within the limits of safety.

The number of passengers carried in some large and densely populated buildings amounts to from 10,000 to 20,000 per day.

In the Drexel building, Philadelphia, ten storeys high, and having 120,000 square feet of office space above the first floor between 1,500 and 1,600 passengers were carried in one hour.

After the building is completed it is always difficult, and sometimes impossible, to modify the elevator installation, so that the proper number and size of the elevators is an important question to determine.

The speed and size of the car, the height and office floor area of the building and the method of operating must be considered. In tall buildings where more than four cars are installed, the service may be improved by running some of the cars to stop at all floors and others to run "express" beyond the lower floors and "accommodation" above.

TABLE NO. 1.

Building.	Storeys.	Office-area above first-floor.	No. of cars.	Square feet per car.	Area car, sq. ft.
St. Paul Building, New York .	25	83,200 sq. ft.	6	13,900	23'6"
Empire Building, New York .	21	150,000 "	10	15,000	42'0"
N. American Building, Philadelphia .	18	90,500 "	5	18,100	27'6"
Real Estate, Philadelphia .	17	151,650 "	10	15,160	23'7"
Bowling Green, New York .	16	222,000 "	9	24,700	—
Land Title, Philadelphia .	15	66,400 "	5	13,300	29'6"
Stephen Girard, Philadelphia .	13	67,000 "	4	16,750	29'6"
Drexel Building, Philadelphia .	10	130,000 "	6	21,700	21'1"

The writer has attempted to formulate a rule, based upon the operation of elevators in various buildings, by taking factors in the calculation the office floor space, the number of trips per hour and the size of the cars, which is subject to modification for "express" service.

An idea of the practice in elevator installations may be obtained from Table No. 1, which gives the storey heights, the approximate area of office space above the first floor, the number of cars, the office area per car and the area of each car.

To determine the number of trips and car-travel per

* Extract from a paper by Mr. Charles G. Darrach read before the American Society of Civil Engineers and published in the *American Architect*.

hour, observations were made at four office buildings in Philadelphia:—

Drexel building, ten storeys high; Stephen Girard building, thirteen storeys high; Land Title and Trust building, fifteen storeys high; Real Estate Trust building, seventeen storeys high.

TABLE NO. 2.

Building.	Storeys.	Height, feet.	Travel per trip, feet.	Trips per hour.	Average feet per minute.	Miles per hour.
Drexel Building	4	40	80	60	80	.910
"	5	50	100	52	87	.984
"	10†	108	216	35	126	1.431
"	10†	108	216	35	126	1.431
Stephen Girard Building	13	130	300	30	150	1.704
Land Title Trust Building	15	180	360	27*	162*	1.840†
"	15	180	360	24†	144†	1.636‡
Real Estate Trust Building	17	200	400	25	167	1.894

From these data the following are estimated:—

Bowling Green	16	190†	380	26	164	1.87
Empire	21	250†	500	22	183	2.08
St. Paul	25	300†	600	20	200	2.273

In the Drexel building, which has six elevators, one elevator ran from the first to the fourth storey, one elevator from the first to the fifth storey, two elevators from the first to the tenth storey, stopping, if required, at any of the floors, and two elevators ran to the fifth storey "express," and served all the storeys above.

At the Stephen Girard building there were four elevators, which ran "accommodation" through.

At the Land Title and Trust Company's building there were five elevators which ran on schedule time "accommodation" to all floors except the second

At the Real Estate building all the cars ran "accommodation" through.

Table No. 2 shows the results obtained, and also an approximate estimate of the running time for the Bowling Green, Empire and St. Paul buildings, New York City.

From observations at the Drexel building in 1897 during the noon hour, the up-travel from the first floor reached 800 passengers, with a maximum of twelve to thirteen passengers in the car. The cars were also overtaxed all day, from 10 A.M. until 4 P.M.

At the Land Title building, running twenty-four trips per hour, the service was very satisfactory. There was a slight crowding during the noon hour; this, however, can be remedied by the use of the improved car-signalling apparatus.

At the Stephen Girard Building the cars are crowded during the noon hour, and also between three and five in the afternoon

All three of these buildings are well filled.

The Real Estate building is not fully occupied, so that the elevator service there cannot be fairly judged. At present the installation is very satisfactory.

Using the trips per hour as observed and estimated, and equating the car area by the formula—

a = A / (T x 22)

a=square feet of car area.
A=square feet of office area.
T=total trips per hour.

TABLE NO. 3.—EQUATED CAR-AREAS.

Building.	Storeys.	Number of cars.	Sq. ft. of office-area per car.	Actual car-area in sq. ft.	Equated car-area in sq. ft.	Estimated trips per hour.
St. Paul	25	6	13,900	23.6	31.5	120
Empire	21	10	15,000	42.0	31.0	220
Real Estate	17	10	15,560	23.7	28.3	250
Bowling Green	16	9	24,700	—	43.1	234
Land Title	15	5	13,300	—	22.4	135
"	15	5	13,300	29.6	25.0	120
Stephen Girard	13	4	16,750	23.0	25.4	120
Drexel	10	6	21,700	21.4	28.2	210

At the Drexel building, the two cars which ran "express" to the fifth floor, and the two cars which ran "accommodation" through, made the same number of trips, and carried practically the same number of passengers. It would be interesting to know whether similar results are obtained in any other buildings, and the advantage gained in arranging the travel of the various cars to serve "accommodation" through the entire trip "express" part way, or providing separate service to different heights in the building.

Using the same formula, and equating to obtain the square feet of office space per car, with given sized cars, and the

number of through trips heretofore used, we have the following results with cars of 25 and 30 square feet area:—

TABLE NO. 4.—SQUARE FEET OF OFFICE-AREA PER CAR.

Storeys.	Car-area=25 sq. ft.	Car-area=30 sq. ft.
25	11,000 sq. ft. per car	13,200 sq. ft. per car
21	12,100 " " "	14,500 " " "
17	13,750 " " "	16,500 " " "
16	14,300 " " "	17 160 " " "
15	14,850 " " "	17,820 " " "
1	16,500 " " "	19,800 " " "
1	19,250 " " "	23,100 " " "

The style of elevator will depend upon the kind of power adopted, the space which can be provided for the operating machinery, and the location of the elevators in the building.

The lifting machinery is driven either by electricity or by water under pressure.

Electric elevators are operated by a motor revolving either a drum carrying a hoisting cable, or a screw with a travelling nut connected with a system of multiplying sheaves and cables.

In another type of electric elevator two independent motors are connected by endless ropes which run over travelling pulleys suspended from overhead sheaves, the hoisting cable being connected with one of the travelling pulleys. The direction and motion of the car is regulated by varying the speed of the driving motors.

Hydraulic elevators are operated by water from a tank at the top of the building, or from a pressure tank containing compressed air, or by pressure obtained by weights. The car is moved either by a vertical ram or hoisted by cables attached to the car and running around overhead sheaves to pistons in horizontal or vertical cylinders, the length of the cylinders being reduced by multiple power transmission in the hoisting cable.

The elevators descend by their own weight and the cars are counterbalanced so that they may descend empty at the required speed.

The water is pumped either directly by steam-engines or by electric motors

The apparatus should be as simple in construction as possible, to obtain speed and efficiency, with economy in power and cost of repairs, and should be so devised that the failure of the principal parts of the machine, or even of some minor part or safety device, will not be the cause of accident.

Increased economy in power by complicated mechanism may be more than counterbalanced by the cost of the machine and by repairs and supervision.

To provide against accident each hoisting machine should whenever possible have a speed-governor to prevent the car from running faster than the maximum required running speed, and in addition the car should be provided with independent automatic safety clutches to clamp the car to the guides should the speed-governor fail or the car fall. The clutch should stop the car gently, without jolt or jar, and should be under the control of the operator

The power-operating machinery should be automatically cut off and stop the cars gently at the top and bottom landings.

The overhead sheaves and beams should be sufficiently high to prevent the counterweights striking them when the car is at its lowest limit of travel, or to prevent the car from striking when at its highest limit of travel. Clearance should be provided at the lowest landing of sufficient depth to prevent the car striking when at the lowest limit of travel.

A device should be provided to prevent the opening and closing of the hatchway doors, except when the car is at the landing, so arranged that the doors must be closed before the car is put in motion, and opened only when the car is stopped.

The hatchway should be kept clear of all operating machinery, and the machinery should be placed where it can at all times be conveniently inspected and repaired.

The cars in electric elevators are controlled by electric contact, in hydraulic elevators by either a hand-wheel or lever operating the starting valves. The lever arrangement requires a pilot valve, which controls a small hydraulic motor operating the main valve. The lever and pilot valves reduce the labour of the car attendant, but add extra mechanism to the apparatus.

The car doors are operated either directly by hand or by a pneumatic apparatus controlled by the foot or by the starting lever.

Where a large number of elevators is installed, a successful signalling device, operated by electricity, is in use. Two push buttons only are placed on each floor, one signalling the cars going up and the other those going down. When the push button is pressed a light is shown in the next arriving car, and notifies the attendant in time to stop at the proper landing. Other lights are located over the hatchway door notifying the passenger, a white light for the up trip and a red light for the down trip.

The hydraulic elevator, unless complicated with a differential

* Actual. † Estimated.

water-supply, uses the same amount of power for light as for heavy loads.

The hydraulic ram elevator is limited in speed and range.

The electric elevator uses power in proportion to the load, and is more economical than the hydraulic machines.

The objection to this form of elevator has been the difficulty in controlling the large starting current, which makes the lamps fluctuate when the elevator is operated from the same source of electricity that serves the lamps.

With this defect remedied, all the machinery in the building, including that serving the electric lights, may be driven by electricity from the same source.

In addition to the transportation of passengers from the street to the various floors, special elevators are frequently installed to serve several storeys occupied by the same tenant.

Provision must also be made to carry freight and heavy safes to all the floors.

Elevators must also be provided for furnishing supplies to and removing ashes and wastes from the basement.

THE "HANGING BRIDGE," MANCHESTER.

A MEETING of the Lancashire and Cheshire Antiquarian Society was held on Friday in the library of Chetham's Hospital. Professor W. Boyd-Dawkins presided. Mr H. T. Crofton read a paper in which he discussed the various theories as to the origin of the name "Hanging Bridge." He quoted from old records to show that the name, and that of Hanging Ditch, were of considerable antiquity. Discussing the theory that "hanging" was derived from the shape of the place owing to the lofty and suspended appearance of the bridge at the edge of a shelf of table-land, as it would appear in early times, Mr. Crofton said there was nothing to show that the word hanging was in local use to describe such a position. On the contrary, the Lancashire usage was in favour of "bank" or "brow" for such a declivity. It was pure conjecture to suppose that the name "Hanging Bridge" as applied to the existing stone structure was a survival of the name given to a previously existing drawbridge. There was no evidence of such a drawbridge, nor of any fortifications such as were usually connected with bridges of that character. The existing stone bridge was probably built about 1420 to provide a convenient access on foot for the inhabitants resorting to their parish church, which was rebuilt at that time, or perhaps the bridge was built when the old bridge over the Irwell was erected, namely, in 1368. Mr. Crofton went thoroughly into the claims of the ditch and bridge to have derived their names from the alleged circumstance that capital punishments were carried out in their vicinity. There was no explicit mention in the old records, he said, of any definite place for executions, but they showed no restriction on the sheriff as to the place where executions were to take place. If sentences were carried out in Manchester, this part of the town would be as likely as any for the purpose, on account of the junction of highways thereabouts, where criminals and suicides were buried, and its nearness to the only prisons in the Salford Hundred, namely, the old prison at Hunt's Bank and the dungeon on the old bridge, which was built as an oratory in 1368, and was converted into a prison in 1580. The county session of the Manor Court was also held in a building in Market Street, which was within a stone's throw of the bridge and ditch. It was clearly proved that the Lords of Manchester had power to inflict the death penalty, and the whole evidence pointed to the conclusion that the ordinary meaning of the word "hanging" had the strongest claims to acceptance.

TESSERÆ.

Influence of Roman Methods of Building.

CIVIL and military construction preserved something of Roman art even when the last traces of this art had long since been abandoned in religious architecture. There were then two quite distinct modes of building dating from the end of the twelfth century—the religious and the civil—and this state of things lasted until toward the middle of the sixteenth century. The monasteries even use both of these methods together; their domiciles have no relation so far as construction goes with their churches or their chapels. Nevertheless, one of the principal attributes of construction at the moment when it abandons Roman traditions, daring, is found also in civil as well as ecclesiastical architecture; but it is evident in civil architecture that the positive ideas, the daily needs, the inherited habits have a more direct influence on the methods adopted by the builder. Thus, for example, rock-faced rubble is used in civil architecture for a long time after all religious constructions were made of cut stone; horizontal arches of stone were everywhere applied to dwellings in the twelfth,

thirteenth, fourteenth and fifteenth centuries, at a time when no trace of them was longer to be found in churches.

Repose in Egyptian Art.

In all the relations of life the sentiment of death was present in some form or other to the Egyptians. In this manner the straight line, the natural expression of eternal repose, in contrast to the wavy line, which represents the animal and vegetable movements of life, became the motive and spirit of their art. The anomaly of death in life was present in every development of the creative faculty, and no architectural or decorative feature could be so slight and unimportant as not to be thoroughly permeated with this sentiment. The tender and graceful lines of the lotus became sublime and monumental under the religious loyalty of Egyptian chisels. Whether used in construction or decoration, these lines, so stiffened and formalised, seem to bring us into the presence of a strange phase of human life and thought long since passed away from any other contact with living creatures. When applied to the rendering of the human figure, especially in the heroic forms of Egyptian art—in the statues and portraits of kings, in the sphinxes, in the colossi of Memnon and the royal tombs—these solemn and fateful lines appear in effect to overwhelm the idea of human mutability and movement in the awful repose of immortality. It seems sufficiently evident that this process of formalising the lines of the human figure in Egyptian art was not the result of the limitation of the powers of the artist to express movement and life, but rather of a consecration of his art to the service of a fundamental religious dogma. "Solid set and moulded in colossal calm," all the lines of this lost art thus recall the sentiment of endless repose, and even the necessary curves of its mouldings are dead with straightness.

The Pedestal.

In Egyptian and Assyrian architecture the columns generally stand upon the ground, or where they are raised upon a stylobate (as, for example, in the small temple at Philæ, commonly called the Bed of Pharaoh) the latter is of a height which gives it rather the importance of a leading feature than an accessory. The pedestal, properly so called, belongs altogether to a later and more complete style of art, and seems a natural step in the development as well of sculpturesque as of architectural composition. Even with the Greeks this feature is but rudimentarily treated in the earlier works, the stylobate of three steps being the only approach to the idea of a pedestal until the introduction of the Ionic order. The Temple of the Giants at Agrigentum is supposed to be the only example in which a base is applied to the Doric order. This and a greater number of steps in the stylobate seems to show marked progress in the development of the principle involved in the use of the pedestal. As in the earlier architecture, so in the sculpture, there is an entire absence of what may properly be called a pedestal. The sphinxes of the Sacred Way at Philæ have only a low square plinth without architectural features of any kind. The colossi of the plain of Thebes, of the rock-cut temple of Ipsamboul, and many other examples are treated in the same way. It should be observed, however, that in none of these examples is the secret of scale—namely, the subordination of parts and gradation of dimension—entirely omitted, though it is not applied by means of architectural accessories. The colossi are surrounded by smaller figures of nymphs and divinities, and the sphinxes and caryatid figures have hieroglyphics and incised ornaments upon the square plinths, which assist materially in giving importance to the principal object.

St. Sernin, Toulouse.

The most noble monument of Romanesque art in Toulouse—and, indeed, of the South of France—is the celebrated church of St. Sernin. It is built of brick and stone, as a three-aisled Latin cross basilica, with a semicircular apse and five apsidal chapels. There is a west entrance, with two north and two south ones. The general character is large and massive, the ornament pure and good Romanesque, and the brickwork very careful, judiciously relieved by courses and dressings of warm-coloured stone. The whole is surmounted by a peculiarly fine brick tower of five tiers of arcades, with which we are so familiar through engravings and photographs. The church is stated to have been finished and consecrated A.D. 1090. The best sculpture is to be found on the doorway, and the south porch (nave entrance) is an excellent example. The cornice of the projecting wall shows the peculiar ornament and patera of Nîmes Cathedral, combined with the brackets of Notre-Dame du Port, at Clermont. The archway is semicircular, and in the centre is the Saviour in glory, attendant seraphim and angels, and the twelve apostles beneath. The angle corbels of doorway are formed by David seated on a lion's back playing the viol, on one side; on the other, two men seated cross-legged and caressing lions. The capitals of the columns are carved with subjects from the life of the Saviour, monsters, foliage, &c. There are two columns

on each side; the mouldings are the plain, hollow and round; the corbels of the cornice show in succession a monkey with a lion's head in his paws, a bunch of grapes, a lion, a monster vomiting his own legs, a young woman's head with wild dishevelled hair, a matron hooded, a goat, and an animal too much broken to be made out. It would be difficult to explain the two saints carved on each side of the portal with allegorical sculpture above and beneath. But however interesting the exterior may be, the interior is equally remarkable, and the marble slabs of the Saviour and the Apostles on the choir wall, stated to be saved from the old church built by Charlemagne, particularly merit notice.

Kant and Art.

"Nature was found beautiful," says Kant, "when it looked at the same time as if it were art; and art can only be called beautiful if we are conscious that it is art, and it yet appears to us as if it were nature." The words hint, but scarcely express, the relation between the beauty of nature and the beauty of art. Kant, while contending that an interest in the beauties of art is no evidence of an attachment to moral goodness, declares that it is always a sign of inward loveliness to take an habitual and immediate interest in the beautiful forms of nature. But the reason of the distinction is not germane to the matter, for the superiority of the taste for natural beauty is merely founded on the circumstance that, by showing itself where there is no admixture of social and other extraneous interests, it displays more unequivocally the susceptibility to beauty for its own sake. And we may therefore, as Kant seems to imply, consult the analysis of the conditions of art production to throw some light on the beauty of nature. Whereas taste, or the faculty of æsthetic criticism, only contains part of the secret, genius, or the faculty of æsthetic production, gives the true key. Art realises the beauty of nature.

German Sculpture.

When from the primordial moulds of architecture, that mould which is common both to painting and sculpture, there issued the statue, the living figure complete in itself, an event took place in the world of art similar to that which was witnessed in the world of reality, when man, free and master of himself, emerged from the bosom of nature. In the one as in the other creation, form, in the highest degree of abstraction and power, disengaged itself from the envelope of matter and the vague depths of space. Painting, which is the common offspring of architecture and sculpture, is involved in relations more complex, and has ever remained in a state of dependence, which the fictions of art have been unable to conceal. Now sculpture being, of all others, the art of form, has, for this very reason, always been difficult of access to the German race. We may account for this, compendiously, but not the less truly, by observing that the Teutonic migration was accompanied by the system of Oriental pantheism—a system which, in multiplied diversities of form, and varying with every phase of human circumstance, is peculiar to the German mind, and seems destined to reappear at the completion of each cycle in its intellectual existence. This system merges all distinctions of form in the mysteries of a unity eternally changing and eternally persisting. The monuments that have been bequeathed to Germany by the remoter epochs of the Middle Ages show no traces of national sculpture capable of rivalling the originality or power the schools of painting that then flourished in that country. The sculpture of the Byzantines, that of the French, that of the Italians, each in its turn, has exercised an influence almost sovereign over the ancient conaternities of German artists. The revival, indeed, gave to some of those who succeeded the ancient statuary a certain particularity of character; but it was not national, and the artists themselves remained, in their sphere, far behind their countrymen who achieved immortality by labours of the pencil. Looking, then, at what was done of old, the conclusion would be irresistible that a German sculptor will have more trouble in overcoming the difficulties of his art and gaining celebrity than will a German painter not his superior in talent.

Architectural Taste.

The taste intellectual as well as the taste organic is more materially affected by habit than perhaps by any other agency, and habit in this instance is only another word for association. The palate may be trained to a relish of the most nauseous substances, as every one must know who has had the resolution to overcome a quid of tobacco. The Greenlander is in like manner brought to relish a feast of train-oil, though he probably could turn with aversion from the choicest of our viands. As it is in the physical so it is in the spiritual man, for here, as rarely, taste may be elevated or degraded by the nature of the culture it may happen to receive. Some men there are whose æsthetic taste has been so quickened by use, or, in other words, by cultivation, that they are enabled to detect the minutest differences between the most nearly identical flavours—such, for example, as the wine of different vintages, and the quantity

of tea of one particular kind in a mixture of different samples. In literature, again, and indeed in the whole of the fine arts, a similar delicacy of taste or rather of perception, is occasionally to be met with; and those powers, which to ordinary observers appear well nigh miraculous, are traceable altogether to a careful cultivation. A taste in architecture is to be acquired by the same arduous and persevering toil as a taste in more vulgar things, and there is no man, if his heart be only warm and his intelligence of ordinary quality, who, if he only resolve, may not arrive at a fine taste in the particular walk in which he aspires to renown.

Roman Roads.

Vitruvius does not disdain to give directions for making roads; he recommends that the engineer should choose solid ground and level it, and upon this lay his first covering, and that if there be any looseness in the soil he must consolidate it by means of wooden piles, "*Fistucationibus cum magnâ curâ solidetur.*" We should hardly imagine that this is a subject for poetry, but yet it is from a passage in the poet Statius that we chiefly learn how a road was commenced. First they cut two parallel furrows, to indicate the width of the road, and then they cut down between those until they came to the hard bottom, and then began the levelling. As the construction proceeded the road assumed a slight convex shape; the middle or top was called the *dorsum*, or backbone of the way, or, as it is called in Virgil, "*in aggere viæ*;" roads that were left in the rough material were said to be "*munite*," but when covered with rough polygonal blocks it was a "*via strata*," from whence is derived the Italian "*strada*." Specimens of this "*opus stratum*" are still existing on the *Via Ostiensis* and the *Via Appia*, in the neighbourhood of Rome, but a piece in the best preservation is on the *Via Albana*, the triumphal way that led up to the Temple of Jupiter Latialis, on the Alban Mount; the letters V.N (*Via Numinis*) may still be read upon this pavement, which has kept its place for near 2,000 years. All these remains, and many others that might be enumerated about the hills of Frascati, Præneste and Tivoli are of the same description, being composed of large polygonal blocks of basaltic lava, found in many places near Rome, particularly in the quarries near the Lake Regillus, under the Capuchin convent, near Bovillæ, also near the sepulchre of Cecilia Metella. This sort of stone was called by the ancient Romans "*silex*," or "*lapis siliceus*," and the places where it was got were called "*lapidicina siliceæ*." The Roman *viæ* were edged by a step on each side; these were called *crepidines*, margins or umbones; they were about 9 inches in elevation. The other materials used in roads were a mixture of broken fragments of all sorts, called "*rudus*," which we should call in plain English, rubbish; *terra-cotta*, called *testa*; and that most plentiful of materials used in the works of Rome, *tufa*.

Liverpool Cathedral.

SIR,—The thanks of the entire body of architects are due to the Press for its powerful help in the cause of architecture generally, even more than in that of the Liverpool Cathedral in particular. By opening its columns to a discussion of the original conditions of competition issued by the Liverpool Cathedral committee, and to the protests made by architects against the committee's claim to prevent freedom of thought and expression amongst those who should submit designs for the cathedral, it has done much to obtain a better appreciation of architecture. The withdrawal by the Liverpool Cathedral committee of their first conditions of competition, and the issue by them of amended conditions wherein the word "*Gothic*" is omitted, is a great act of moral courage, which will have far reaching effects. Indeed, it would not be surprising if, from that act of the cathedral committee, there should date a very general recognition of what architecture truly is, viz. the art of building, not the science of reproduction.

But the committee must take a further step if the Liverpool Cathedral is to be all that it might be. They must, in fact, boldly abandon all idea of using the cheap and makeshift site of St James's Mount, and they must stake their all upon the site first selected, viz. that of Monument Place. They are already possessed of sufficient funds to secure the latter site, even if not to also commence building operations; but even as a magnificent site would inspire architects to magnificent architecture, so would it inspire those to do so who are able to provide the means for its realisation.

The relative merits of the two sites are well understood in Liverpool, and, as they were referred to in my letter in the *Times* of the 8th ult., it is unnecessary for me to add references

thereto. But that a very strong opinion is rapidly growing throughout the country, as well as in Liverpool, in favour of the adoption of Monument Place site there is no doubt whatever, and the cathedral committee must be fully aware that such is the fact from the practical cessation of contributions towards their St. James's Mount site scheme. The committee would therefore only be far-seeing and wise to note the trend of popular opinion, and to launch a new and bolder scheme without delay. It would perhaps require some greater moral courage than the committee have already evinced to issue further amended conditions of competition; but the success of the competition nevertheless demands that even this step should be taken, as an analysis of the existing position will show. For under the present conditions there will be held a competition for a cathedral to be erected upon an unknown site, upon unknown foundations, with unknown levels to be dealt with, and for unknown accommodation. And the drawings in explanation thereof may be working drawings or mere sketches; may be drawn to various scales or not to scale; may be in ink or pencil, coloured or uncoloured, and may be further illustrated by perspective views or by photographs, and, moreover, the designs may represent ideals or accomplished facts. From this heterogeneous mass of information, to which the whole world is permitted to contribute, the cathedral committee undertake to decide which of the competitors, whether one or more, is to be adjudged by them worthy to submit further designs for the cathedral. And the committee will pay the sum of three hundred guineas to one or more competitors, if they decide to hold a second competition, for work which, if it is to be efficiently performed, would involve an expenditure by each competitor of from eighteen months to two years of time and thought and some 500*l.* to 600*l.* of expenses. Surely it must be very obvious that such a form of competition will not only fail to call forth the best possible design, but will also result in a hopeless imbroglio, from which even their professional advisers would be quite powerless to extricate the committee.—I am, Sir, your obedient servant,

T. MYDDELTON SHALLCROSS.

6 Dale Street, Liverpool:
November 8, 1901.

The Date in Roman Characters.

SIR,—There seems to be no general consent as to how to express the present year of grace.

On clocks and watches we see IIII written for four, but I have seen an early Florentine mosaic picture on which is a clock dial for six hours only, and on that four is expressed by IV; the present method may be due therefore to the convenience of teaching children the time or to having a balance to the 8 opposite.

Nowhere else are four indicators used. VIII, LXXX, DCCC may each express the power of nine, but the Roman method was IX, XC, and presumably CM for these.

For nearly two years now MCM or MCMI has been the reasonable Roman method of expressing the year current, and it is confirmed by penny table-books, and at my instigation was cut in stone, although, sad to relate, the chairman of committee thought it must be wrong because he did not understand its signification, and asked, "What does it mean?"

MDCCCLXXXVIII, for 1888, takes 13 indicators; when another unit was added IX represented it, and later XC disposed of the L, and now that another century is turned the indication of fifth power disappears. In 2888 they will all be back again. There is no law to compel any to use Roman indicators, but it must be bad antiquarianism to use them otherwise than in the Roman method.—Yours faithfully,

H. W.

Re Broad Street Place.

SIR,—As the architect for the new building on this site, I have read with much interest the letter of your correspondent, Mr. Funston, in your last week's issue, but fear he has misread the third paragraph in the description given on October 18, which does not suggest that previous to 1817-20 there was any building on the site. In fact, I have in my office evidences of the marsh ground which have been recently brought to the surface, together with a map one hundred years old showing the open space. The object of the paragraph in question is simply to endeavour to trace, if possible, the previous home of the Catholic community before it settled at St. Mary's.

The other statements referred to are extracted from a treatise by the Rev. William Fleming, who resided in the house adjoining the chapel. I was fortunate enough to obtain a copy of this small pamphlet at St. Mary's, and I considered that that gentleman could be relied upon in compiling a history of his own church and its site. He distinctly states on page 5 that the Moorfields congregation met in "a large house in White Street (where the present City of London College stands) from 1780-1820," and not in "a chapel in White Street," as your correspondent suggests, and on the same page Mr. Fleming affirms that the site was purchased from the

Fishmongers' Company as a result of subscriptions in response to a circular dated June 20, 1816, issued by the rector, the Rev. Joseph Hunt, and no mention is made of the Corporation as the vendor.

Your readers must, nevertheless, thank Mr. Funston for kindly going to the trouble of investigating these little points affecting so important a site, and I am now informed that he is correct in saying the new chapel is not in Ropemaker Street but in Eldon Street.—Yours faithfully,

G. D. MARTIN.

3 Pall Mall East, S.W.: November 13, 1901.

GENERAL.

The First Ordinary Meeting of the Society of Architects fixed for Thursday, November 21, is unavoidably postponed to Thursday, November 28, at 8 P.M., when the president, Mr. Silvanus Trevail, F.R.I.B.A., will give his inaugural address.

The New Students of the French school at Athens were invited by M. Loubet to a déjeuner at the Elysée prior to their departure.

The Corner-stone has been laid of a new church at Peter sham Lodge, to be erected at a cost of 10,000*l.*, with seating accommodation for 600 people. The building is Romanesque in style, with a nave, two aisles and a tower. The architect is Mr. John Kelly.

Mr. Fredk. Bristowe, engineer, announces that his present address is Albany Buildings, 47 Victoria Street, S.W.

The Great Pyramid will probably be reproduced at the St. Louis Exposition. It is declared that the structure could be duplicated with a steel framework and stiff covering at comparatively small expense.

The Nave of St. John's Church, Gainsborough, Lincolnshire, is to be lengthened by three bays, the cost being estimated at over 2,000*l.*

The Liverpool Architectural Society will hold the first members' meeting of the session on Monday in the Free Library, William Brown Street, by permission of the city librarian, when the valuable collection of books on architectural subjects will be on view.

The Berlin Municipal Council have rejected a proposal that the Council should build dwelling-houses for the officials and workmen in its employ, as also a proposal to establish a municipal bureau for furnishing information as to suitable dwellings free of charge.

The Windsor Rural District Council claim to have jurisdiction over the new stands on the Ascot racecourse and buildings on Crown land, except those for the use of the Royal family.

A Factory in Newcastle has collapsed through the falling in of an old pit shaft which had been covered up and forgotten since 1842.

Sir William Forwood, the chairman of the executive committee of the Liverpool Cathedral, says that the site has been definitely fixed at St. James's Mount, and no alterations will be made. The foundations have been proved, the levels are now being taken, and in due course a plan will be at the disposal of architects.

M. Georges Picard, who has already adorned the cupola of the Galerie Lobau in the Paris Hôtel de Ville, has received a commission for paintings in four of the panels in the gallery.

The London County Council have decided that the name "Little Dorrit's Playground" be applied to the open space at Falcon Court, Southwark, near the site of the Marshalsea Prison.

Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, will read a paper on "Fireproof Construction" before the Royal School of Military Engineering at Chatham on November 21, the date being selected as near as possible to the anniversary of the great Cripplegate fire of 1897, which, it will be remembered, took place on the afternoon of November 19. Mr. Ellis Marsland, district surveyor of Camberwell, and chairman of the committee's testing station, has similarly consented to read a paper on the committee's work at Glasgow before the Insurance and Actuarial Society of Glasgow on December 9. Mr. Marsland is the master of the Tylers and Bricklayers' Company for the current year.

At the Monthly Meeting of the Council of the Sanitary Assurance Association held at No. 5 Argyll Place, Regent Street, W., on Monday last, Mr. Andrew Stirling in the chair, the death of General H. K. Burne, C.B., was reported, and the motion of Sir Vincent H. Kennett Barrington, seconded by Mr. W. S. Halsey, and supported by Dr. Willoughby and Mark H. Judge, the following resolution was adopted: "Resolved, that the Council of the Sanitary Assurance Association, recording the death of General H. K. Burne, C.B., desire to acknowledge the services which he rendered to the Association during the seventeen years he was a member of the Executive Council, and the loss the Association has sustained by his lamented death."

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BARNSELY.—Nov. 22.—Competitive drawings are invited for the adaptation of property situate in Pitt Street, Barnsley, for union and relief offices, &c. A premium of 20*l.* will be awarded for the accepted design. Mr. C. J. Tyas, clerk, 7 and 19 Regent Street, Barnsley.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive designs for laying-out about 12½ acres of land for ornamental grounds. Premium of 20*l.* offered for the selected design. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BEXHILL.—Nov. 23.—The Bexhill Urban District Council invite competitive plans for an isolation hospital. Premium of 50*l.* offered. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

BURSLEM.—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100*l.* and 50*l.* will be awarded for the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

DARTMOUTH.—Nov. 20.—Plans are invited for offices and dwelling-house, to be erected on the South Embankment, Dartmouth. All particulars may be obtained from the Channel Coaling Co., Ltd.

GLASGOW.—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL.—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

KINGSTON-UPON-THAMES.—Nov. 14.—Designs are invited for a new public library. Mr. Harold A. Winsor, town clerk, Kingston-upon-Thames.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

CONTRACTS OPEN.

ALDERSHOT.—Nov. 19.—For repairs to machinery of the steam road-roller. Mr. W. E. Foster, District Council Offices, Aldershot.

ARGENTINE REPUBLIC.—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

ASHTON-UNDER-LYNE.—Nov. 18.—For extension of the mechanics' shop and erection of a new engine and boiler-house. Messrs. Thos. George & Son, architects, Old Square, Ashton-under-Lyne.

ASKAM-IN-FURNESS.—Nov. 23.—For erection of two houses in Dale Street, Askam, Lancs. Mr. Cowley, 10 Marsh Street, Askam-in-Furness.

ASKAM-IN-FURNESS.—Nov. 28.—For erection of new Primitive Methodist Sunday schools, and heating same and existing chapel. Rev. W. Carr, minister, Slater Terrace Dalton-in-Furness.

AYLSHAM.—Dec. 2.—For conversion of dormitories into sick wards at the workhouse at Aylsham, Norfolk, installation of a hot and cold-water supply, heating by hot water, construction of invalids' lift and iron emergency staircase. Mr. John B. Pearce, architect, 15 Upper King Street, Norwich.

BAMBURGH.—Nov. 29.—For erection of new coastguard buildings, consisting of quarters for two men and a look-out house, at Ross Links, near Bamburgh, Northumberland. Particulars may be seen at the Coastguard Station at Bamburgh, and at the Director of Works Department, Admiralty.

BARROW-IN-FURNESS.—Nov. 18.—For erection of a block of five shops and dwelling-houses in Vickerstown, Isle of Walney, Barrow-in-Furness. Plans and specifications can be seen at the offices of the Isle of Walney, Estates Company, Limited, Walney.

BARROW-IN-FURNESS.—For wiring the new technical school for between 500 and 600 lamps. Mr. C. F. Preston, town clerk, Town Hall, Barrow-in-Furness.

BETHNAL GREEN.—Dec. 10.—For water-supply works at the workhouse and for the infirmary, comprising—(1) Enlarging the existing well and lining with iron cylinders; (2) supply

Fig. 9.

and fixing of two gas-engines and pumping machinery; (3) erection of water-tower; (4) supply and fixing of cast-iron tank, about 70,000 gallons capacity; (5) supply and laying of 6-inch mains, &c. Mr. G. H. Hughes, engineer, 97 Queen Victoria Street, E.C.

BIRKENHEAD.—Dec. 11.—For laying a 14-inch pumping main, spigot and socket, lead joints, from Station Road, Hooton, to the reservoirs on Prenton Hill, Birkenhead, a distance of 6½ miles. Mr. W. Martin Jones, secretary, Cheshire Water Co., 9 Hamilton Square, Birkenhead.

BLACKBURN.—Nov. 18.—For alteration to shed roof at the Witton outlet works. Mr. William Stubbs, borough engineer.

BOLTON.—Nov. 19.—For erection of a cotton and machinery shed and re-erection of a timber gantry at Halliwell goods yard, Bolton, for the Lancashire and Yorkshire Railway Company. Mr. R. C. Irwin, secretary, Hunt's Bank, Manchester.

BOURNEMOUTH.—Nov. 18.—For erection of engine and boiler-houses and chimney-shaft. Mr. F. W. Lacey, borough engineer, Municipal Offices, Bournemouth.

BRADFORD.—Nov. 19.—For erection of four houses at Great Horton. Mr. Horace E. Priestley, architect, 17 Bertram Road, Manningham, Bradford.

BRENTFORD.—Nov. 20.—For erection of an isolation hospital, with administrative buildings, &c., at Clayponds Lane, Brentford. Mr. Arthur Ramsden, surveyor to the District Council, Town Hall, Chiswick.

BRENTWOOD.—Nov. 20.—For construction of bacteria beds, tanks, engine-house, &c., at the sewage works, Nag's Head Lane, Brook Street, Brentwood, Essex. Mr. Hall Jones, Parliament Mansions, Victoria Street, Westminster.

BRIGHTON.—Nov. 25.—For supply of electricity meters for one year from January 1. Mr. Francis J. Tillstone, town clerk, Town Hall, Brighton.

BURY.—Dec. 17.—For construction of sewage-disposal works, comprising circular precipitation tanks, bacteria beds, channels, sludge tank and roads at Livsey Fields. Mr. John Haslam, town clerk, Corporation Offices, Bury.

BURY.—Nov. 18.—For supply and delivery at Bury, Lancashire, of fourteen 69-passenger electric trams and fourteen 48-passenger electric trams. Messrs. Lacey, Clirehugh & Sillar, engineers, 78 King Street, Manchester.

CAMBERWELL.—Dec. 2.—For providing and fixing steam boilers, economiser, feed-water apparatus, steam and condense mains, cold-water storage tank, mains and branches, hot-water storage heater, mains and branches, waste-pipes and branches to slipper-baths, slipper-bath valves and all connections, laundry apparatus and machinery to public and establishment laundry, and heating apparatus, &c., complete, to the new public baths, laundry and library now being erected in Wells Street. Mr. Maurice B. Adams, architect, Clement's House, Clement's Inn Passage, W.C.

CANTERBURY.—Nov. 20.—For erection of three cottages in the Martyrs' Field Road. Mr. A. H. Steele, architect, 1 Effingham Lawn, Folkestone Road, Dover.

CHESTERFIELD.—Dec. 13.—For construction of a storage reservoir upon the Bar Brook, between Totley and Baslow. Mr. R. F. Hartwright, clerk to Rural District Council, Chesterfield.

CLITHEROE.—Nov. 30.—For excavating and building two new settling tanks, with channels, sluice valves, &c., on the sewage farm at Henthorne, Clitheroe, Lancs. Mr. Arthur R. Bleavard, borough surveyor, Church Street, Clitheroe.

CONISBOROUGH.—Dec. 10.—For erection of an isolation hospital near Conisborough, York. Mr. J. H. Morton, architect, 50 King Street, South Shields.

CORNWALL.—Nov. 18.—For erection of school buildings and alterations to chapel premises, reseating, &c., at the Foundry Wesleyan chapel, Hayle. Mr. Sampson Hill, architect, Green Lane, Redruth.

COVENTRY.—Nov. 27.—For supply and erection of a triple-expansion low-speed vertical marine-type engine and a 400-kw. direct-coupled alternator and exciter in one specification. Mr. J. A. Jeckell, Corporation Electricity Works, Coventry.

CROYDON.—Nov. 18.—For construction of an underground electricity sub-station in Addiscombe Grove. Mr. E. Mawdesley, town clerk, Town Hall, Croydon.

DARLINGTON.—Nov. 20.—For enlargement of the head post office, Darlington. Particulars and forms of tender may be obtained at H.M. Office of Works, &c., Storey's Gate, S.W.

DARTFORD.—Dec. 3.—For erection of refuse destructor. Mr. W. Harston, surveyor, High Street, Dartford.

DUNGENESS.—Dec. 2.—For erection of a new lighthouse, fog-signal house, &c., at Dungeness. Mr. E. G. Verity, 7 Great Marlborough Street, W.

WARWICK.—Dec. 5.—For erection of a union infirmary and appurtenant buildings to accommodate 151 inmates and staff at Warwick, and the supply of steam, hot-water, cooking and other apparatus and fittings for the infirmary. Mr. F. P. Trepess, architect, 8 Jury Street, Warwick.

WEST HAM.—Nov. 26.—For erection of thirty-six double-tenement houses for the working classes in Invicta and Rendel Roads, Canning Town, E. Mr. John G. Morley, borough engineer, Town Hall, West Ham, E.

WIMBLEDON.—Nov. 20.—For construction of new concrete sewage precipitation sludge and storm-water tanks, sludge pumps, cast-iron mains, valves, floating arms, penstocks, &c., at the sewage works, Durnsford Road. Plans and specifications can be seen and bill of quantities obtained at the Council Offices, Broadway, Wimbledon.

WINNINGTON.—Nov. 25.—For erection of a caretaker's house at the sewage outfall works at Winnington, Northwich. Messrs. H. Bancroft & Sons, civil engineers, 88 Mosley Street, Manchester.

A SPECIAL meeting of the Blackpool Town Council was held to settle finally the question of widening the Promenade. It was decided a short time ago to widen the Promenade by a hundred feet, and the only other point to be dealt with was that of the style of the hulking. The borough surveyor's report, based on visits he has made to some of the chief seaside resorts of this country and of the Continent, was fully discussed, and, by twenty-nine votes to seven, his recommendation that an upright concave sea-wall be adopted was passed. The contention of the South Shore representatives was that a sloping hulking was the better one for that part of the town. The borough surveyor, however, pointed out that this meant an additional expenditure of 50,000*l.*, besides further encroachment on the sands. The work will be commenced at once. One small section has already been done to the south of the Victoria Pier, with a slight slope. Now the big section between Victoria Pier and Central Pier, over a mile in length, will be put in hand. The chief substance to be used is black basaltic rock from the Rhine valley.

TENDERS.

ABBOTSKERSWELL.

For erection of a house. Mr. S. SEGAR, architect, Union Street, Newton Abbot, Devon. Quantities by architect.

THE MAY-OATWAY FIRE ALARM

Simple, Inexpensive, and Reliable.

Licensed by H.M. Postmaster-General.

St. Dunstan's Church has just been seriously burned, and it may be the turn of St. Paul's or Westminster Abbey next. Serious injury by fire is now unpardonable. The May-Oatway Fire Alarm insures discovery in time to prevent loss or fatal consequences. It detects the fire, calls the nearest Fire Brigade, and all helpers, and points out the seat, extent, and course of the fire automatically, whether the building is occupied or not. Architects and builders invited to inspect.

SIR EYRE M. SHAW (late London Fire Brigade), Chairman.

NEW CATALOGUES.

MR. VINCENT ROBERTS, of Cherry Row, Leeds, sends us an excellently turned out illustrated and priced catalogue of the various boilers, radiators and appliances of which he makes a specialty. The book, which is handsomely bound and printed on very high grade paper, contains, in addition to the useful information alluded to, some interesting photographic views of Mr. Roberts's offices and extensive works, and of public and private buildings in which his heating apparatus has been installed.

A HANDSOMELY illustrated catalogue of ornamental glass which we have received from Messrs. O. C. Hawkes, Ltd., contains a large and varied selection of suggestive designs for all classes of Ecclesiastical and Domestic stained-glass work, French and English embossed glass, French embossed and brilliant cut glass, &c. Many of the designs, of which there are some hundreds, are reproduced in chromo-lithography, with highly satisfactory and artistic results. In addition to the Ecclesiastical and Domestic work shown, some excellent specimens of business labels, fascias and letters are given, with their respective prices.

IN a series of four catalogues issued by Messrs. Robert Boyle & Son, Ltd., of 64 Holborn Viaduct, their system of ventilation as applied respectively to hospitals and asylums, churches, schools and domestic purposes, is fully and lucidly described in its latest developments. This system as applied to buildings consists of Boyle's patent self-acting air-pump ventilator, for which it is claimed that it removes the pressure of the external air from the top of the outlet shaft, and creates under every condition of the weather a continuous and powerful exhaust at the higher parts of the building; combined with Boyle's improved air-inlets fixed at the lower levels, admitting the air directly through the walls in an upward direction at a low velocity, purified and warmed or cooled as required, insuring a constant change of air and perfect diffusion of the fresh air supply in strict accordance with the natural laws which govern ventilation.

PRINCESS CHRISTIAN visited Leatherhead on Wednesday for the purpose of laying the foundation-stone of a new School for the Indigent Blind, which is to replace the old institution in Southwark.

TRADE NOTES.

THE new cottage hospital, Cranleigh, is being warmed and ventilated by means of Shorland's patent Manchester stoves and grates, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. COUSLAND & MACKAY, ventilating engineers, 150 Hope Street, Glasgow, are carrying out the ventilation of the combination poorhouse, Hamilton, by means of Mackay's patent direct-acting ventilators, of which they are the sole makers.

THE warming of the new Stratten Hall, Hull, is to be by Spencer's patent "Ventilo" radiators, of which the patentee and sole maker is W. F. Spencer, Cross Bank Works, Oldham, and 145 Queen Victoria Street, E.C., who is installing the apparatus.

ELECTRIC NOTES.

THE Dover municipality has decided to apply for powers to purchase the electric-light works for the borough, the electric trams being already the property of the ratepayers. The price agreed is 129,000/.

THE Rhyl Electric Light and Destructor Works were opened on the 7th inst. They are the largest in North Wales, and cost 30,000/., including provision for electrical traction. Sixteen miles of cable have been laid.

THE contract which the London County Council gave on Tuesday to Messrs. Dick, Kerr & Co. for the generation plant for the first section of the new electric tramways from Kennington to Balham is the largest ever placed in this country, approximating as it does to 20,000 horse-power. Orders for this kind of machinery have always heretofore gone abroad, no English firm being in a position to undertake them. Foreign competition in this particular case was very keen, 372 tenders in all having been sent in, of which about half were from German and American firms. The whole of the work on the present contract will be British.

THE ceremony took place last Saturday evening of switching on the electric light for the illumination of the streets of Cowdenbeath, N.B. Cables extending to 11,000 yards have been laid from an engine and dynamo-house at the Fife Coal Company's No. 7 Cowdenbeath pit, and there are 200 pillar lamps, each carrying two incandescent lights of 16 candle.

power in the main thoroughfares, and 8 candle-power in the side streets, brought up from the top of the pillar on the swan neck principle. The cables are laid at a depth of 2 feet from the surface of the roadway. The total cost of the work is about 1,800*l*. Simultaneously with the laying of the electric cables, the Cowdenbeath Gas Company have been erecting mains and laying gas mains for the supply of gas to shops and dwelling-houses.

IN connection with His Majesty's birthday a number of electric illuminating devices were executed on the E.L.B. system, a notable scheme being the decoration of the Grosvenor Mansions, which have some 200 feet frontage in Victoria Street. The whole front was illuminated with festoons and large electric devices. Mottoes were also provided for the Drury Lane Theatre, and at the Royal Opera House, Covent Garden, where the principal lighting effects for the balls were already installed on the E.L.B. system, special illuminations were provided, which were switched on while Friday's ball was in progress, to herald November 9.

AT Rothesay Town Council's meeting on Monday it was reported in connection with the electric-light installation, which has given great dissatisfaction owing to its unsatisfactory working, that a remit had been made to Mr. W. Arnott, electrical engineer, Glasgow, to report on the whole system and to take it over from the contractors. Bailie Fisher moved as an amendment that the electric light be turned off altogether except during the four months that the visitors were at Rothesay, as the community evidently grudged the cost of the amendment met with no support, several members insisting that it was not the electric light but the arrangement of the defective working that the ratepayers objected to.

BUILDING AND BUILDERS.

It was proposed to erect a new Wesleyan church at Longwood, Halifax. A site has been secured and it is hoped that during operations, the cost of which will amount to about 100*l*, will be started at the beginning of the new year.

TENDERS are to be invited by the Vice-chancellor of the University of Cambridge for roofing in the east court of the library, in accordance with the plan prepared by Mr. W. C. Marshall. The amounts are not to exceed 6,500*l*.

AN adjourned meeting of the Cheltenham Town Council was held on Monday, the mayor (Alderman Colonel Rogers) presiding, when the tenders for the erection of the proposed new town hall were considered. Alderman Norman moved that the contract be given to Messrs. Collins & Godfrey, of Cheltenham and Tewkesbury, at 29,310*l*. Mr. Parsonage seconded the motion. Mr. Stroud proposed that no tender be accepted, and wished to reopen the whole question, but was ruled out of order, and his amendment was not accepted by the Mayor. Eventually the committee's recommendation as moved by Alderman Norman was adopted.

IN reference to the proposed new reservoir for Girvan, N.B., twelve contractors, accompanied by Mr. Eaglesham, of Messrs. J. & H. V. Eaglesham, Ayr, the engineers of the works, proceeded on Saturday to Pinmacher Burn, where the new storage reservoir is to be made, to examine the ground with a view of tendering for the construction of the reservoir, which includes the laying of about 1½ mile of cast-iron piping between Pinmacher and the present reservoir at Glendrisaig. The new reservoir is to hold about 13 million gallons from the same spring which supplies the present reservoir, and which is of exceptionally fine quality.

THE building committee of the Bradford Corporation during the twelve months ending August 31 approved 445 plans out of 1,160 deposited. Included in the plans approved were 1,145 dwelling-houses, 21 houses and shops, 12 warehouses, 4 mills, 16 workshops, 2 places of worship, 25 lock-up shops, 54 streets and 92 back roads. Plans were also approved for 5 Board schools, 2 Poor Law relief stations, 2 tall chimney-shafts and the electricity generating station. There was more activity in the building trade than in the previous year, but less than in either 1898 or 1899.

VARIETIES.

A NEW church hall erected at Kilsyth, N.B., at a cost of 800*l*, was opened on Monday last.

A NEW Wesleyan church which, with a school and other buildings, has cost over 9,000*l*, was opened at Middleton on the 11th inst.

THE Trowbridge Urban Sanitary Authority have adopted the much-discussed sewage disposal scheme. The works themselves will cost approximately 17,757*l*; wages and other contin-

gent expenses will increase the total to 20,420*l.*; the cost of land 2,907*l.*, which, together with 500*l.* for legal expenses, gives a total cost of 23,827*l.*

A FURTHER section of the work involved in the restoration of the fine old parish church of Kidderminster has been completed, and the new oak roofs in the north and south aisles of the church were dedicated a few days since. The successive restorations of the old church and the additions to it have covered a period of over half a century, and it is probably under the mark to say that the expenditure they have entailed exceeds 40,000*l.* The work now completed has cost about 800*l.*

ST. PAUL'S CHURCH, Balsall Heath, which has undergone considerable renovation, was formally reopened on the 16th ult. by the Bishop of Coventry. The interior has been greatly beautified, and many other improvements effected. The organ, which stood on the right-hand side of the chancel, has been removed, and a private chapel constructed. The instrument, too, has been remodelled, and it will in future find a place in the gallery. Careful attention has also been paid to the lighting and ventilation of the edifice. The old gas standards have been replaced by hanging pendants, and the incandescent light installed, while a huge ventilator has been constructed in the roof. The walls and ceiling, which have been decorated in pale green, bear a number of appropriate symbolical devices, and a neat frieze, a representation of the Vine, adds materially to the artistic effect. The seating accommodation has also been improved. The renovation scheme includes a new altar and reredos, which will be provided within the next month. Messrs. Buckland & Farmer, architects, have superintended the work of Messrs. F. J. Briley and A. Seers, the builders and decorators respectively, the cost of which, it is estimated, will exceed 1,000*l.*

THE formal opening of Wesley Street new Board schools, Farsley, has taken place. Only the mixed school has been built, but the site is large enough for a future infants' school, manual training-room, laundry, &c. The present accommodation is for 486 scholars, which can be increased to 546 (if required) at a very small cost. The estimated cost of the building, including street-construction charges, is 7,208*l.*

A LECTURE-HALL with a seating capacity of 250 seats, and a church parlour in connection therewith, have been added to the Wesleyan chapel and schools, St. George's Street, Cheltenham. The building has been erected by Mr. Amos

Wilson, of Cheltenham, from the plans of Mr. Arthur Geo. Dalzell, architect, of Halifax, and Mr. Thomas Malvern, surveyor, of Cheltenham, has superintended the work during the course of construction.

AN extensive landslip has taken place in the Scarborough Castle Hill. One crack is 4 feet wide, and from this opening the land has subsided 3 feet. Altogether the subsidence extends over more than one acre of land. Mr. E. T. Beard, the resident engineer for the construction of the new promenade and drive round the Castle Hill, reports that a general movement has been observable during the past fortnight, but that since Saturday the slide has been more rapid.

THE Victoria Home for Nurses, in connection with the infirmary at Salisbury, was opened on the 1st inst. The building, which has been erected from designs by Messrs. J. Harding & Son, is of red brick with tiled roof, without stone dressings, the design being bold and effective. The entrance for the nurses will be from the infirmary, through a covered way erected in memory of Miss Bonham Carter, who served the infirmary with such zeal as night superintendent from 1893 to 1897. On entering the building a cloakroom will be found on the left, 19 feet by 12 feet fitted with lavatories, dressing-tables and lockers. There are also a linen sorting-room and box-room, the latter containing the switches for the electric light, the home being lighted throughout with electricity and heated with hot water. On the right side of the corridor is the furnace-room with heating apparatus and hot-water supply, kitchen and scullery for the use of the staff, the nurses still continuing to take their meals in the infirmary. The corridor leads into a hall opening into which are sitting-rooms for the superintendent, head nurse and probationers. The superintendent's apartment is 18 feet by 11 feet 6 inches, the nurses' 18 feet by 18 feet, and the probationers' 28 feet by 17 feet. On the first and second floors are forty-four bedrooms, varying in size from 18 feet by 9 feet 6 inches to 12 feet by 8 feet 6 inches. The staircases are of stone, and provision is made for escape in case of fire by three iron ladders which are accessible from each floor. The upper floors are of Potter's patent fireproof construction. Telephone and electric bell communication is established with the infirmary.

COLONEL DURNFORD, Local Government Board Inspector, conducted an inquiry at Blackpool on Tuesday into the Corporation's application to amend the Act of Parliament sanctioning the promenade widening so as

w 100 feet instead of 60, the added cost being 40,000/., mission to borrow which amount was sought. Mr. Fletcher used, not the widening, but the details on behalf of Mr. Eames and other South Shore residents. Mr. T. Os, the town clerk, said that in 1865 the then Local Board did it necessary to promote an Act of Parliament to construct a marine promenade and carriage drive which now existed. Maintenance and regulation of these works were thrown on the Corporation and frontagers, who were rated for the capital expenditure. In 1865 the population was 5,000 and the rateable value about 23,000/.. In 1899 the Corporation saw the absolute necessity for widening the promenade. The population then was 46,000 and the rateable value 68/. The Act obtained in 1899 empowered the Corporation to construct the hulk either sloping or upright. It was owing to strong feeling in the town that the promenade should be widened 100 feet that the work had not been commenced before now. A certain section in South Shore were in favour of a sloping hulk instead of a concave wall as decided by the Corporation, and it was this upright wall that Mr. Os was opposing. The town clerk pointed out that if the hulk was dropped the Corporation could go on under present powers, but they could only widen 60 feet, and the opposition would get nothing they wanted—time would be wasted, the promenade would be too narrow and there would be an upright wall after all. Evidence in favour of the hulk was given by Mr. J. S. Brodie, the borough surveyor, who was subjected to a lengthy cross-examination by Mr. Os, as were also Mr. Sandeman, a Newcastle engineer, and Mr. Alderman J. Ward. These witnesses all maintained that the upright wall was better and cheaper than a sloping hulk. The inquiry, after a four and a half hours' sitting, adjourned until a date to be fixed.

BOARD SCHOOL SITES IN HAMPSTEAD.

Following memorial from owners and occupiers of houses in immediate proximity to the property called The Grove, Hampstead, has been forwarded to the London School Board:—"As owners and occupiers of houses in immediate proximity to the property called The Grove, which, as we understand, you have scheduled as a suitable site for a Board school, we beg to submit to you the following considerations, as it seems to us, render such a proposal on your part desirable:—(1) The close neighbourhood of the site named

to the Heath, and more especially to that charming avenue called The Judges' Walk, at present the resort of so many invalids and others desirous of the quiet enjoyment of the prospect it affords, an enjoyment it would be too much to expect would be longer possible after the establishment of the school within a few yards of the Walk; (2) the considerable distance of the proposed site from the homes of the children on whose behalf the school is needed; (3) the fact that immediately surrounding the proposed school are a number of highly-rented houses, the value and quiet enjoyment of which would be very seriously affected by so near a neighbourhood of the school, and the noise necessarily incidental to the collection of so large a number of children. We would respectfully urge upon you that, in deference alike to public and private interests, as also to what is due to the picturesque beauties and old associations of this district, you will not select a site for your school open to so many objections."

ALL HALLOWS CHURCH, BRISTOL.

THE consecration of the nave and dedication of the chancel of the new church at Easton took place on the 2nd inst. The style of the church is Decorated English Gothic. The exterior will be plain almost to severity, the chief object being to secure an effective interior. From the east end three bays have already been completed. There is an apsidal termination of the sanctuary, with an ambulatory around it. The interior height of the church will at once appeal to those who visit the edifice, the lofty arches between the choir and the transepts adding considerably to this effect. The part of the scheme now carried out embraces the sanctuary, choir, north and south transepts and side chapel, and three bays of the nave. When the scheme is completed two or three bays will be added, together with a western narthex. The walls are faced with red Pennant dressed with Bath stone, and the roofs are open-timbered.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting of the Birmingham Master Builders' Association was held recently at the Grand Hotel, Birmingham, Councillor F. G. Whittall presiding. In the report for the year the committee regretted that the falling off of trade referred to twelve months ago had become more marked, and

TO THE TRADE.

much work that would probably not now be executed had been held back owing to the high prices of material and labour. The committee felt strongly that the present high rate of wages was no longer justified by the state of trade, and they had received from individual members many complaints as to the great inconvenience resulting from the present arrangement of several trades commencing and leaving off work at different hours. Consequently they had served notices on all trades for a general reduction of wages and for uniform hours of work. The committee felt they would be voicing the opinion of every member of the Association by expressing to the Chancellor of the Birmingham University their regret that Birmingham architects had been excluded from a competition for the University buildings. The balance sheet showed that the receipts for the year were 1811, which, with the balance from last year, made a total of 3681. The various disbursements amounted to 1541, leaving a sum of 2141 to the credit of the Association.

In proposing the adoption of the report the Chairman referred to the state of the trade, which, he said, continued to be unsatisfactory. The large number of workmen that called upon them to obtain work showed that trade must be in a very bad state. It was because of the condition of the trade that the committee, after careful and anxious thought, had deemed it advisable to give notice for a reduction of wages. It had not been done to cause differences or disagreements in the trade, but for the purpose of trying, if possible, to stimulate trade, which had suffered through the high price of material and labour. A great deal of work had been put aside until it could be done more cheaply, and they considered the reduction of wages would be in the best interests of the trade and the workmen. He hoped the operatives would accept the reduction. The committee had taken some amount of trouble and effort to assist the funds of the Birmingham University, and therefore they keenly regretted that the architects of the city had no opportunity of competing for the designs of the new building.

Mr. W. Sapcote seconded the resolution, which was carried.

Mr. Albert S. Smith was elected president for the ensuing year, and Mr. John Barnsley vice-president. Mr. G. Twigg was reappointed treasurer, Mr. E. J. Bigwood secretary, and Messrs T. Johnson and J. S. Surnam auditors. The committee were also elected. In order to financially strengthen the position of the Association, it was decided that, from the commencement of next year, the annual subscription should be 15.

for each 1001. of wages paid during the previous year. The retiring president, Councillor F. G. Whittall, was heartily thanked for his services during the year.

In the evening the annual dinner was held at the Grand Hotel. The Lord Mayor (Alderman J. H. Lloyd) presided, and, replying to the toast, "The City and Trade of Birmingham," given by Mr. Barnsley, spoke of the necessity for looking ahead to prepare for the requirements of the city, and said that it was the support of the citizens that helped a city like Birmingham to keep abreast of the time. They were proud of the men on the city council who devoted so much of their leisure time to the welfare of the city. With regard to jerry-building, he said that whatever might have been the case in the past they did not have jerry-building in Birmingham now. Some of the builders might think that the by-laws were hard and strict, but he knew they themselves were anxious that buildings should be put up properly and well. If at any time there was anything that was too stringent, he hoped such cases would be carefully considered and discussed, and as far as possible rectified and set in order. They must all admit that jerry-built houses had been erected in the past, and undoubtedly a great deal of the property, which had existed for a very long time, ought now to be pulled down, and the owners should not endeavour to patch it up. He hoped as time went on some of the slums would be cleared out and the buildings of the town improved. The slum and the housing questions were very important matters which would have to be faced with great care and attention. He hoped something might be done in the future to improve and benefit the mode of life of some of their poorer citizens. There were undoubtedly many ways in which the dwellers themselves largely added to the difficulties. Many of the builders individually were doing good work, apart from their businesses, uplift humanity, and much help was forthcoming from the Sunday schools and the adult schools and various other organisations. Mr. Barnsley had referred to the accumulation of the city's debts, but he reminded them that the builders had had a good "pull" out of the expenditure. On the whole, he thought they had very good assets, they had good business undertakings which were likely to prosper well in the future. While they should exercise due economy they wished on the other hand to keep abreast of the time, and anticipate as far as possible the needs of a few years ahead.

Mr. C. E. Bateman, in proposing "Success to the Birmingham Builders' Association," expressed the hope that soon

member of the Association would secure the contract for the new University buildings.

The President replied, and referred to the proposal to reduce the operatives' wages. The Association, he said, was not formed for the purpose of cutting down the men's wages, and they regretted that it was necessary to interfere with them. No one grudged the operative a good wage, but what they did resent very much was that restriction of output, that constant lessening of the amount of work which the unions encouraged. Their notices had been served upon the operatives having reference to certain unreasonable restrictions in trade rules which they were glad to have an opportunity of discussing, and they sincerely hoped all the matters would be amicably settled.

The other toasts were "The Architects and Surveyors," "The National Federation of Building Trade Employers," and "The Visitors."

INSTITUTION OF CIVIL ENGINEERS.

The Institution of Civil Engineers held the first meeting of its eighty-third session on the 5th inst., when Mr. James Mansergh formally surrendered the chair to his successor, Mr. Charles Hawksley.

Mr. Hawksley delivered his presidential address. He referred, in the first place, to the fact that this was the first occasion in the history of the institution in which the presidential chair had been held by the son of a former president, and next expressed his regret that Sir William White, though prior vice-president, had felt himself unable, in consequence of the state of his health, to accept nomination for the presidency. He proceeded to give a rapid retrospect of the advances made during the nineteenth century in the more prominent branches of civil engineering. As regards roads, he pointed out that except for about 200 miles of good roads constructed by the blind road-maker, John Metcalf, in Lancashire and Yorkshire during the latter half of the eighteenth century, the roads in this country were in a deplorable condition at the beginning of last century, so that carriages often stuck fast in ruts, and travelling at a speed over six or seven miles an hour was almost impossible even on the main thoroughfares. In 1811 the mail-coach from London to Holyhead took 41 hours for the journey. In 1837, owing to the improved roads con-

structed by Telford, the time was decreased to 27 hours, the journey being performed at the rate of 9½ miles an hour, including stoppages. At the same date the journey by mail-coach from London to Edinburgh was performed in 42½ hours (9½ miles an hour), and the fare was 11½ guineas inside and 7½ guineas outside, or, with fees to the coachman and guards, about 14½ guineas inside and 10½ outside. The fastest four-horse mail-coaches carried, beside the driver and guard, four inside and three outside passengers, but some of the improved stage-coaches carried as many as twenty-two passengers, and in some cases rivalled the mail-coaches in speed. The day mail-coach from London to Birmingham was timed to do twelve miles an hour. The early first-class carriages on railways resembled the bodies of three stage-coaches placed one behind the other on a frame having four wheels; each compartment held four passengers, and the roof was too low to admit of a person standing upright. Third-class passengers travelled in open carriages, the sides of which were 3 feet or 3½ feet in height. The speed of the original passenger trains was about eight miles an hour, but this was increased in a few years to twenty, and now passengers could travel at an inclusive rate of about fifty miles an hour at a cost of from 1½d. to 2d. a mile first class and 1d a mile third class. After touching on docks, lighthouses, naval architecture, mining, water-power and irrigation, Mr. Hawksley came to the history of water supply. Speaking of the regulation of fittings so as to be suitable for a constant supply, he said that formerly Parliament left the making of such regulations to the company or local authority entrusted with the supply of water, but of late years had unfortunately made them subject to the approval of a Government department, which was possessed of no special knowledge in regard to distribution of water, and which, regardless of the experience of fifty years, persisted in so modifying the regulations submitted for their approval as to render them impracticable for the maintenance of a constant service. In regard to the quantity of water required for domestic purposes with a constant service, he remarked that from statistics he recently collected the quantity of water supplied for domestic and other non-metered purposes was, on the average of six towns supplied by companies and having a total population of 1,850,000 persons, 19 gallons per head per diem, while for ten towns supplied by public authorities, and having a total population of 3,961,000 persons, the average was 18½ gallons. He was unable to agree with those who held that all waterworks undertakings should be in the hands

of public authorities. He had many opportunities of becoming acquainted with the unsoundness of many of the arguments put forward in favour of transfer of water undertakings to local authorities, e.g. control of the breaking open of the streets, economy in collection of the water rates and absence of inducement to make profits. His experience taught him that where the local authority possessed the waterworks the streets committee complained that they had no sooner repaved a street than the water committee broke it open to lay a pipe, the salaries in the finance department were raised because of the additional duties the officials had to perform, the desire to make profits at least equalled that of a company, while the risks that a local authority was prepared to run by unduly postponing needful extensions in order to maintain those profits were such as, in many instances, a company would not dare to incur. Should a company lag behind in its duty there was the local authority at hand to urge it forward, but if the local authority was supine in the exercise of its duties there was no one to bring pressure, for the ratepayer was practically helpless. Mr. Hawksley went on to speak of sewerage and sewage disposal, gasworks and electricity, mentioning in regard to the latter that, although it was the youngest of the sciences, over 130,000,000*l* of capital had already been invested in this country alone in electrical undertakings. Summing up his impressions, Mr. Hawksley said that the more he learnt of those early engineers who practised in the latter half of the eighteenth and the first quarter of the nineteenth centuries, the greater became his astonishment at, and admiration for, the boldness of their designs and the success that attended their execution. Most of them were men of scanty education, as the term was understood now; and had few, if any, precedents to guide them; yet in face of all difficulties, with no trained assistants to aid them, at a time when travelling was arduous, Brindley, Smeaton, Mylne, Rennie, Telford and others carried out works of which we might be proud at the present day, even with all our training and precedents, assistance and mechanical appliances. It might be well to recall that Brindley's early years were spent as an agricultural labourer, Smeaton was a philosophical instrument maker, Mylne an architect, Rennie a millwright, and Telford a stonemason.

In the latter part of his address Mr. Hawksley discussed the question of standardisation. Most British civil engineers, he said, had probably suffered inconvenience and their clients not unlikely loss, owing to the absence in Great Britain of

standard sections of iron and steel. For example, the engineer when designing a roof or bridge, having selected from the book of some well-known firm the sections of angle and tee-iron best suited to his requirements, found the contractor asking to be allowed to substitute some other section, because the one chosen was out of stock or was no longer rolled, or was required in such small quantity that the makers would not put in the rolls to produce it. These difficulties had led to the adoption in Germany and America of standard sections, with great advantage to all concerned. The producer could cheapen the cost of production, being able to roll considerable quantities of any given section at one time and place in stock any surplus. The middleman (if any) could buy in the cheapest market and be certain of finding an outlet for his purchases. The buyer could be sure of obtaining the section he required with the least amount of delay and at the least cost. For some time past the Council of the Institution had realised the disadvantages under which British manufacturers were placed by the lack of some acknowledged standards, and it therefore approached the Institutions of Mechanical Engineers and Civil Engineers, Naval Architects and the Iron and Steel Institute, with the result that the four societies formed a strong and influential committee to take up the subject. This committee sat for three days in June last, hearing evidence from all parts of the country and from those representing our colonies and dependencies, and this evidence was so unanimous as to the desirability of issuing standard sections and specifications, that the Institution of Civil Engineers decided to adopt the committee's recommendation and proceed with the work forthwith. The committee had been divided into four parts to deal with—(1) Bridges and general construction (chairman, Sir Benjamin Baker); (2) railway rolling stock under frames (chairman, Sir Douglas Fox); (3) rails (chairman, Sir J. Wolfe Barry); and (4) ships (chairman, Mr. Archibald Denny). The four committees were now engaged in standardising the various sections used in their particular branches of industry. From the evidence laid before the committee it appeared that in America, where the American Society of Civil Engineers had issued standard sections for rails and standard specifications, the rolling-mill makers would in most cases only roll those sections. From time to time inquiries had been sent from this country to America for tenders for large quantities of rails and other materials, but in nearly every case the reply was that "unless you take our standards, we regret we do not see our way to quote." On the other hand, some instructions

stances of the waste of time and money in this country for want of standard sections were laid before the committee. One instance must suffice—that of a section incorporated in a bridge at one of our colonies. Here the average cost of the material was 8*l.* 10*s.* per ton, but one of the sections specified was of an odd size, and the quantity of it was so small, that it had to be made by a blacksmith at a cost of from 28*l.* to 30*l.* per ton. A striking case of the money wasted by unnecessary multiplication of the number of sections occurred recently, where the contractor endeavoured to obtain the sections specified for a certain bridge, but found that although they were obtained in the price list issued by the makers, none were in stock, and delivery could not be given. The contractor, therefore, worked out a girder of equivalent strength, incorporating therein sections that could be readily obtained, and the saving on this one item was over 600*l.* Germany had now 67 various standardised sections, and America only 49, while Britain had only one standard section, and used over 170 different ones. In the case of tram-rails the need for standards of rails was being specially felt. It was recently shown that there were no less than seventy-one different sections of tram-rails, many of which were designed by the municipal engineers designing their own sections, which only differed slightly from those of their neighbours—just sufficiently to cause trouble and expense if one system ever became adopted by the next. The American practice was to reduce the number of sections as much as possible, but this, Mr. Hawksley thought, was travelling too far in the opposite direction. Care must be taken to provide a considerable variety of sections in the first instance, and to add to them from time to time as necessary. The chief disadvantage urged against standardisation had been the tendency to cramp originality of design, and that this was a groundless fear was shown by the refusal of American makers to roll anything outside their stock patterns.

THE KEW COWL TESTS.

We have received a communication from Mr. Robert Boyle, of the firm of Robert Boyle & Son, Ltd., respecting the report of the Sanitary Institute on the tests of ventilating exhaust cowlings, and which we have already noticed. In it he writes:—“It will doubtless come as a great surprise to many, this astounding admission of the Sanitary Institute that they themselves are the patentees and proprietors of the cowlings alleged in

the report to be the most efficient, “though Professor Shaw does not endorse this conclusion.” It almost passes credence that the Sanitary Institute do not see the extreme impropriety of their position—no matter what their intentions may have been—which completely discredits any decision emanating from them on this matter, which they have taken upon themselves to judge. The gross injustice of such a proceeding to other ventilator makers who, by their efforts, have created the present public interest in the question of ventilation, need not be here referred to, particularly after Professor Shaw has so emphatically condemned the tests as valueless; but I should have thought that it formed no part of the mission of the Sanitary Institute to discourage such efforts, particularly in an endeavour to add to its own importance, and to be considered as an authority upon a subject in respect to which it has shown that at the most it merely possesses that little knowledge that is “a dangerous thing.”

Surely nothing like this has ever been known before in the annals of scientific research, and the consequences to the Institute may prove incalculable. To prevent any possibility of mistake or misunderstanding, perhaps the Council of the Institute will reply to the following questions, as it is just possible that some too enterprising official of the Institute has allowed his zeal in this matter to outstrip his discretion, and that the Council themselves are not wholly responsible:—

1. Was it with the full knowledge and sanction of the Council that the patents for the cowlings in question were taken out?
2. Why, if no monopolistic rights were intended, and the public were to have the free and unrestricted use of these cowlings, was the useless expense of patenting them incurred?
3. Why is there not the slightest mention of all this in the report?
4. Is it true that an agreement exists, or ever existed, between the Sanitary Institute and the assistant who arranged and carried out the tests with these cowlings, to pay him a royalty on their sale?

It remains to be seen if the Sanitary Institute, after the universal condemnation of these tests, and of the methods by which the results were attained, also the statement of Professor Shaw in the report that the relative values of the cowlings, terminals and tubes had not been proved, and that therefore the tests did not correctly indicate which particular forms were the most efficient, will still persist in representing the cowlings (which appear from the illustrations to be merely old modifica-

tions of the open pipe with rain caps) as having been proved by these tests to be the most efficient, or will allow its *imprimatur* to be used in connection with them.

May I be allowed to suggest that the Institute should take legal opinion as to whether, indeed, this would not be illegal, as such a proceeding might be looked upon, after Professor Shaw's verdict, as a case of "false representation" and an attempt to mislead.

As the ventilators against which the Institute tested their terminals were what are now obsolete forms—and merely models at that, which prove nothing, as was well known to Mr. Field—it would most undoubtedly be misleading to assert that the Institute's cowls had been proved by these tests to be the best in the market at the present time, seeing that the improved forms of ventilators now in use were not included in the tests at all.

Surely the Sanitary Institute is not in such desperate straits that it requires to resort to such tactics to keep its name before the public, which, as I understand these tests, seems to have been their principal object. At any rate, it would not be conduct such as one expects from a Society occupying the position held by the Sanitary Institute. The Sanitary Institute should have been satisfied with the verdict of the *Times* on the first instalment of the report, when it said:—

"The method of testing was incorrect and therefore the tests are valueless. Neither in the case of either of the cowls or the tubes was their true value as extractors ascertained."

The Sanitary Institute has certainly no right to complain of the outburst of indignant protest which the publication of the report has called forth. They have deliberately brought it upon themselves, though I cannot bring myself to believe that the Council of the Institute have been wholly to blame in this matter, and judgment, so far as they at least are concerned, ought to be suspended until they have replied to the questions which have been put.

Judging from the names and reputations of the gentlemen forming the Council, I should say that they were the very last in the world to knowingly countenance anything having the slightest suggestion of "shadiness."

I have just seen in a publication an enlarged drawing of the Sanitary Institute's "Champion Cowl," and find that it is nothing more nor less than a replica of an old chimney-cowl that was first made by me over thirty years ago. That being so, I am afraid the Institute's patent is not worth the value of the paper the specification is printed on. As it is now "many

years ago" since I made a "gift to the nation" of this cowl, it would appear that the Sanitary Institute has been somewhat forestalled in its proposed "benefaction." I have notified the Sanitary Institute of this discovery, and intimated that if they care to send a responsible person who knows something about cowls to 64 Holborn Viaduct, I would show him drawings and models of this cowl, and also the cowl itself, besides several other modifications of cowls on the same lines. In large sizes, for several reasons arrived at from actual practical experience (which reasons the Institute appear to have either ignored, or to be ignorant of in their application to their cowl, I never considered it good enough to make a ventilator of, and I think that the Institute would have arrived at the same conclusion if they had made the tests with full-sized specimens instead of models, as was done.

REFUSE DESTRUCTION AND ELECTRICITY AT BIRMINGHAM.

MR. H. PERCY BOULNOIS, Local Government Board inspector, held an inquiry at the Council House on the 6th inst. into the City Council's application to borrow 31,600*l.* for purposes of a refuse destructor, stabling, &c., at Rotton Park Street wharf. The town clerk (Mr. E. O. Smith) informed the inspector that the health committee had for some time had under consideration the necessity for erecting additional furnaces for destroying refuse at the wharf in question. The two furnaces at present there were altogether inadequate to the work to be done, being capable of burning only about 50 tons per week of unscreened refuse. There was also a great need for stabling at the wharf. The horses at present drawing refuse there were stabled on the public works committee's premises at Sheepcote Street, and a payment of 500*l.* per annum had to be made in respect of the occupation of those premises. This sum would more than defray the interest and sinking fund on the cost of the new stabling. During recent years there had been a considerable increase in the amount of dry refuse collected in the district, and such of it as could not be burnt or disposed of as manure was sent away at considerable expense to tips. A piece of land, 5,912 square yards in extent, adjoining the present wharf, was secured in 1897 at a rental of 9*d.* per square yard, and the total area now available for wharf purposes was 8,810 square yards. The heat from the

...ing would be utilised for the various purposes for which steam
as required, as well as for lighting the wharf with electricity.
he stables would have accommodation for fifty-four horses.
'The city treasurer (Mr. T. H. Clare) stated that the
population of Birmingham, according to the last census, was
2,182, and the assessable value 2,735,426*l.* The existing
bts under the Sanitary and Public Health Acts amounted to
330,832 6*s.* 6*d.*, and provision for repayment had been made
the extent of 672,504*l.* 1*s.* 9*d.* The assessable value for two
ars was 5,470,852*l.*, leaving a balance of unexhausted borrow-
g powers amounting to 4,312,523*l.* 15*s.* 3*d.*
The Town Clerk stated that the stabling and usual
cessories were estimated to cost 7,845*l.*, and the buildings in
nection with the destructor 11,000*l.* A canal wall would
ve to be built costing 300*l.*, and 1,000*l.* would have to be
ended on underbuilding the walls of adjoining premises.
ving the stable-yard would cost 463*l.*, and the remainder of
e site 1,000*l.* It was estimated that the destructor itself
uld cost 7,850*l.*, whilst 1,500*l.* would be taken up in clerk of
e works' salary and architect's commission.
Alderman Cook (chairman of the health committee) and
derman Martineau were present at the inquiry. The former,
lying to the Local Government Board inspector said that he
d not seen the Liverpool destructor, but a similar one was in
at Montgomery Street. The type of boiler favoured by the
alth committee for the Rotton Park Street wharf was
ended primarily for the destruction of refuse, and secondarily
provide electric light for the committee's own purposes.
Mr. Boulnois afterwards inspected the site of the proposed
ldings.

WOOD-PAVING IN AMERICA.*

EATED wooden-block paving has been used in London for
r thirty years on both her finest and most heavily-travelled
dways. Paris has nearly four times as many square yards
it in use as of asphalt. There had been laid in 1891
000 square metres and in 1898 1,165,000 square metres of
den blocks, there being at that time 382,600 square metres
spalte and 1,348,000 square metres of macadam.

From a paper presented to the American Society of Municipal
vements, by Mr. B. T. Wheeler, Superintendent of Streets,
on, Mass.

Foreign growths of wood are, however, practically pro-
hibited for use in America by reason of their large cost. To
produce a pavement at moderate and justifiable expense a
native wood must be used, so treated, if possible, as to harden
its fibre, make it practically impervious to moisture, and not
readily susceptible to the varying conditions of heat and cold.
There is no gauge of durability by which the attempts to
produce such results can now be judged. Practice has not yet
demonstrated in this country what our natural products can
create in the way of a permanent pavement of this character.
There were laid last year in Boston for experimental
purposes, in the midst of the otherwise asphalted surface of a
busy but lightly trafficked thoroughfare, two small areas of
wooden blocks, 1,360 yards in all, treated by the so-called creo-
resinate process. These areas were laid in the steepest grades
thereof, and in one case for only half the width of the street,
the other half being of asphalt, that the relative merits of the
two might be compared.

This pavement was prepared and laid in the following
manner:—

The blocks were uniformly 4 inches wide, 4 inches deep and
8 inches long, of long-leaf Georgia yellow pine, free from sap,
loose or rotten knots, and with no second-growth timber
allowed. These blocks were placed in an air-tight cylinder,
and the dry heat was raised to 215 degrees Fahr., with-
out pressure, for one hour, for the purpose of expelling
the moisture. The heat was then increased, pressure was
applied, and the degree of both was raised gradually, in order
to avoid injury to the fibre, during a period of two hours, until the
heat had reached 285 deg., and the pressure about 90 lbs., and
both were then held at that point for one hour. The heat was
then shut off, and the tanks allowed to cool gradually for one
hour. At the end of this time the heat had been reduced to
250 degs., and the pressure to about 40 lbs. The pressure was
then blown off and the heat still further reduced. Vacuum was
then applied until about 26 inches was reached; and while
under vacuum the creo-resinate mixture was run into the
cylinders at a temperature of from 175 to 200 degs., and
hydraulic pressure was then applied, reaching 200 lbs. per
square inch, and kept at this point until from 21 to 22 lbs. of
the mixture per cubic foot had been absorbed. The liquid
was then run off, and the wood placed in another cylinder, and
milk of lime, at a temperature of 150 degs., was run in, and
hydraulic pressure of about 200 lbs. was applied for one hour.
The blocks were laid, with the grain vertical, upon a

foundation consisting of American cement concrete 6 inches in depth, with a 1-inch cushion of clean, screened sand, and were driven tightly together at every sixth row. The joints were then filled with dry, screened sand, and the pavement rolled with a 5-ton steam roller until the blocks presented a firm, uniform and unyielding surface. The joints were then filled with a creo-resinate mixture of road pitch, heated to 300 degrees Fahrenheit, and the whole covered temporarily with $\frac{1}{4}$ -inch dressing of clean, screened, sharp sand.

It is apparent, after a year's experience with this pavement, that it is satisfactory as so laid in every respect except with regard to slipperiness, and that, as so laid, an almost absolutely noiseless pavement was obtained, the surface of which, under use, became so unified that the joints were indistinguishable, and the pavement consequently slippery. No wear has yet been apparent. The surface remains perfect, and, in comparison with the asphalt adjoining it is preferable in all respects, except that of slipperiness, in which, practically, it does not differ; and, upon the grade of 4 per cent at which it was laid, it has nothing to recommend it in this respect.

I have this year laid an area of 7,940 square yards upon a level street, in the same manner as above described, which I believe will be eminently satisfactory in every respect, and am about to lay, this fall, another area of 6,640 square yards upon a nearly level street, where I expect the same results; but the problem of a noiseless, non-slippery and permanent pavement, which can be laid upon grades exceeding 2 per cent., has not yet been satisfactorily solved. With the hope of more satisfactory results in this respect, however, I have laid upon a 3 per cent. grade an area of 2,000 square yards of wooden blocks, so recently put down as not to permit me to make any statement of the results obtained. This was laid from blocks prepared as above mentioned, differing only in shape and in the character of the joint. From each block, 4 by 4 by 8 inches, there was removed from one side, at the top, a section $\frac{1}{4}$ inch in thickness for the length of the block, and $1\frac{1}{2}$ inches in depth. When these blocks were laid as above described, and driven closely, there was a $\frac{1}{4}$ -inch opening, or joint, remaining, extending clear across the street with each width of block. These joints were filled with Portland cement grout. It is my expectation that this material upon the surface of the street every 4 inches will remove the slippery conditions which would otherwise exist, and furnish better foothold for horses.

There is in my charge, as commissioner having the care, with a representative of the adjoining city of Cambridge, of

those bridges crossing the Charles River and connecting the two municipalities, a bridge, called Harvard Bridge, having roadway area of 11,425 square yards. This bridge was built in 1891, within an insufficient appropriation, and in a manner which has proved to be a falsely economical one. In order to diminish the cost, the structure was lightened, and designed only to carry a wooden floor of 4-inch deck and 2-inch sheathing. Traffic upon this bridge has rapidly increased, and it has been necessary for some years to resheath it annually; and has now become apparent that two resheathings each year will only suffice. As the deck of the structure now shows signs of decay, it has been decided to redeck this entire structure with hard-pine deck, treated by the same creo-resinate process as the blocks, and directly upon this the wooden-block pavement will be laid, closely driven, and without joints, and a contract for this work is now being executed by the United States Wood Preserving Company, of New York, which controls the creo-resinate process. What has for years had many of the characteristics of an uneven corduroy roadway, caused by the rapid wearing of the sheathing plank, will soon present an even, noiseless, smoothly-riding surface, which will not subject the two cities to the cost of annual repairs. Wooden blocks have therefore filled a unique place in furnishing a permanent and satisfactory pavement, placed upon a structure which was not designed to carry the load of any other form of permanent pavement known.

I was brought to the execution of this work by the experience of the city of Chicago in laying a wooden pavement treated, however, by another process—upon the Rush Street Bridge, which carried a large part of the freight traffic of an important railroad terminal, and which had required therefore many renewals annually of the wooden wearing surface plank. This pavement had been laid over two years and half, I think, when I last saw it, and was still apparently first-class condition. Wooden pavement has, therefore, seems to me, a field peculiarly its own in replacing the plank surface of bridges in an economical and satisfactory manner.

The only question, aside from the desirability of laying such pavement upon steep grades, which I have already referred to and which has not yet been satisfactorily demonstrated, is the one of durability which time alone can determine; but a company which has laid this pavement has, for the protection of the city which I represent, given a good and sufficient guarantee to keep the same in condition satisfactory to the superintendent of streets for a period of ten years.

THE WEEK.

A GLIMPSE of the manner in which one class of illustrated catalogues can be got up was afforded by the proceedings in the case OETZMANN v. LEFEVER and others which was heard in the Chancery Division before Mr. Justice SWINFEN EADY. The plaintiffs sought for an injunction to restrain the publication of an illustrated catalogue in parts resembling their own, and the surrender of all copies which had been printed, with the blocks and other materials. The trial lasted three days. Messrs. OETZMANN found that illustrations in their catalogues had been copied, although in some cases the representations were reversed in order to give an appearance of originality. The printers at the outset agreed to be liable for any costs incurred down to the trial, and therefore were dismissed from the action. The draughtsman had stated before two of the plaintiffs' representatives that he had copied their designs; he afterwards attempted to qualify his statement by saying that he restricted his copying to the catalogues of wholesale makers, but his Lordship declined to accept the second version, and an injunction was granted against him. With regard to the defendant, who had issued the catalogues, his Lordship said that several of the illustrations had been copied from Messrs. OETZMANN'S catalogue, and as piracy had been committed the injunction was granted and an order given for the destruction of blocks and stock. A case of the kind is, however, hardly to be covered by the law of copyright. The copying of designs without authority or without acknowledgment is an unquestionable wrong, but a still greater one arises when by the appearance of a second or a third illustration doubts are thrown on the originality of the design which first appeared. Such cases are distinguished from ordinary offences against the Copyright Acts. When well-known paintings are imitated the claim of the artist or inventor is admitted, and he only suffers in a limited degree, but when designs are reproduced the character of the firm that originally paid for them runs the risk of being lowered. The issuing of an injunction and the destruction of copies afford an inadequate penalty for the wrong that has been done.

As Kensington is a royal borough, it is satisfactory to learn, on the authority of the medical officer of health, Dr. DUDFIELD, that its sanitary condition, particularly in the northern part, is not affected by the character of the houses. We are told that the streets are of statutory width, the houses of moderate height. Very generally they have a fair-sized open space at the rear. Courts and alleys there are none, nor back-to-back houses. With here and there an exception, the houses have through ventilation, restricted in many instances by "slip" rooms, which also interfere with the lighting of the passages and the lower flights of stairs. Basement rooms are general, but the use for habitation of such as come within the definition of "underground rooms" is prevented. Of "cellar dwellings," in the ancient sense of the expression, there are none. In a recent investigation but few cases of overcrowding were discovered, if judged by the standard of the by-laws. It was ascertained that in a part described as a "special area" there was a remarkable profit in letting furnished rooms; that is, with furniture for the most part "meagre in quantity, wretched in quality, and hardly deserving the name." Houses worth from 12s. to 15s. a week by that means yield from 30s. to 50s. a week. Even with unfurnished rooms a middleman is able to realise double the weekly rent paid to the landlord. According to Dr. DUDFIELD, considerable benefit would accrue to many of the labouring classes were the sanitary authorities of the Metropolis generally to adopt and fully exercise the powers conferred by Part III. of the Housing of the Working Classes Act, 1890; they would be enabled, as landlords, to provide these classes, without any material charge upon the rates, with more and better accommodation than they can ever hope, unaided, to obtain for the money they now pay in rents to the existing landlords, who naturally study little beyond their own interests.

THERE is less objection than formerly to the apprenticeship of well-educated youths in builders' or engineers' workshops. But in England the desire for acquaintance with practical business has not yet attained the force it has in America. The American Bridge Company, for example, have a fixed programme on the subject which is worth attention. Those who wish to become apprentices have to submit to a three months' trial, and if the candidate is approved, the quarter of a year is counted as part of the four years required for apprenticeship. If a candidate has received a superior education the four years' term may be shortened, and a similar reward is conferred on those who distinguish themselves. The rate of normal wages is as follows:—First year, 3.50 dols. per week; second, 4.50 dols.; third, 5.50 dols.; fourth, 6.50 dols. At the expiration of the apprenticeship a bonus of 50 cents per week is granted. There are classes in which drawing, mathematics and mechanics are taught, and an examination is held at the close of the term. Generally the apprentice begins in the designing department, where he acquires some knowledge of the stresses which have to be dealt with. After six months he is transferred to the drawing-office. Acquaintance with other departments follows. The Bridge Company endeavour to co-operate with the engineering colleges, from which they receive graduates for six months, and pay each of them 12 dols. a week for the services he renders. The student has the best of the arrangement, for although he may assist in preparing drawings and working out calculations, he is given the opportunity of becoming familiar with all the operations of bridge construction. The company are showing public spirit, and from their experience it leads to profit.

THERE is a French saying about nothing being sacred to a sapper, but if compared with a Paris billsticker, especially when elections are in progress, the sapper is a most reverential individual. The municipal regulations are severe against ordinary advertisements, unless they are in positions where they can be taxed and in other ways come under the influence of authority. But political announcements enjoy the utmost license. No matter how venerable a public building may be, or how modern, it can be covered with as many coloured posters as the contractor cares to paste upon them. One of the latest sculptural works in Paris is the group by M. DALOU which symbolises the *Triumph of the Republic*. The beautiful bas-reliefs which form part of the work have sustained serious damage owing to the number of posters which were made to adhere to them. It was proposed that at least some monuments and buildings should be considered as privileged, and a decree to that effect issued by the Prefect of the Seine, but omnipotent as that high and mighty official is assumed to be, he was compelled to confess that under the law of 1881, which relates to posters, he was powerless. While the Republic endures it must therefore be expected that buildings and statues will be desecrated by the billsticker's vandalism.

THE Abbey of Clairvaux, which St. BERNARD founded, holds an important place in the history of monasticism. It was demolished in the beginning of the nineteenth century in order to provide space for a prison. An ancient grille belonging to the church was purchased for the cathedral of Troyes, and was set up at the entrance to the choir. In 1850 it was removed, and was placed in an obscure corner of the building. Money is required to defray the expenses of Troyes Cathedral, for the State grudgingly contributes only insufficient sums. It was accordingly proposed that the grille should be sold. A few weeks ago it was put up to public auction, and was knocked down to an American for 14,200 francs. The work could not be sold without a Presidential decree, and apparently one was obtained without any difficulty. The people of Troyes were desirous to possess the relic of antiquity, but they were unable to raise more than 14,000 francs for its acquisition. It seems incredible that the State was indifferent to the efforts of the inhabitants and would not help them to save a work of art which was of peculiar interest.

WAGES IN THE BUILDING TRADE.

ARCHITECTS and builders who read the *Times* must have been gratified to observe that the first of the articles which are to deal with "The Crisis in British Industry" relates to the building trade. There is no doubt that of late years, and especially at the present time, there is general dissatisfaction about the cost of building. As the public do not make their arrangements with workmen, they too readily assume that the increased price is mainly owing to the eagerness for obtaining a larger percentage by the architects and a larger profit by the builders. It is not sufficiently recognised that the advance of prices has been mainly caused by an advance in wages to workmen and, what is no less costly in the end, a diminution in the quantity of work which is produced, instead of being proportioned to the larger sums which are paid by the building owner.

The correspondent of the *Times*, whose communication we hope will be generally read, endeavours to explain how it happens that in spite of the increased cost of production the work that is executed is diminished. It is unnecessary to say that our readers will not be able to find any novelty in the particulars which are given in order to demonstrate the peculiarities of the system which is now followed by the workmen, for they are too familiar with the freaks in the labour market; but the statements will probably be revelations to the public in general, who have been amazed at the advance in the prices demanded for building and repairing houses. Indeed, the humblest leaseholder who is obliged to have repairs executed can judge from his own limited experience the state of affairs in the building trade almost as well as the wealthy men who have works erected on the largest scale.

One trade which is adapted to serve as a basis for calculations is that of the bricklayer, for in most cases the quantity of work executed can be ascertained by counting. The *Times* correspondent says that thirty years ago 1,200 bricks per day could be laid by a man in railway tunnels; twenty years ago 1,000 bricks could be laid in ordinary building work. At the present time 400 bricks is the accepted limit for dwelling-houses, shops and business premises. In public buildings, and especially those belonging to the London County Council and the London School Board, the number is less. A limitation to 330 bricks a day is approved by the London County Council, and in Board schools it has been found by observation that the average is only 200 per day, and in one instance the number fell to 70. As a consequence of the slow laying, the walling which now costs from 20*l.* to 22*l.* per rod could have been constructed twenty years ago at from 12*l.* to 14*l.* a rod. A case is referred to as occurring in the East End in the middle of last month on which twenty-four bricklayers and twenty-four labourers were employed. The wages paid to them amounted to 98*l.* 4*s.* 2*d.*, and the quantity of work executed for that money was 43 cubic yards, or about 20*l.* per rod for bricklaying alone. If to the cost of wages other expenses are added, it will be manifest that if only 22*l.* per rod were paid, a serious loss to the builder would follow. —That a much larger number of bricks could be laid without imposing any dangerous physical strain the workmen would not deny. Mention is made of a new hand who lately laid 724 bricks in a day without much exertion, but he was not permitted to exhibit such Herculean force for more than two days. His fellows compelled him to withdraw, and his fate will remain as a warning to ambitious bricklayers who may be anxious to demonstrate their possession of ordinary strength of arm.

What is true of bricklaying is no less true of the other trades. The *Times* correspondent acknowledges that an effective remedy is not easy to find. He believes, however, that if builders "formed a solid and compact body through which individual losses sustained in the interests of the whole trade would be met out of a common fund, there would be a better chance of overcoming trade-union tactics, and the arbitrary powers of the unions would, as one man has put it, 'tumble to pieces like a house of cards.'" On the other hand, he affirms it will be practically impossible to place the trade on a satisfactory footing so long as municipal bodies like the London County Council fix a standard which is determined by an exceedingly moderate

output, and which seems adapted for women rather than for men.

The position of architects in relation to the subject is unenviable. They can have no influence over the men, for it is their business to look after the quality rather than the quantity of the work which is produced. They have to insist on stringent clauses in contracts, and, while they are compelled to have them realised to the letter, they must sympathise with the builder when they discover that to faithfully carry out a contract is to bring a loss upon himself. If it could be said that the new system of slow production is a guarantee of superior workmanship, then the architect would be disposed to side with the men; but experience shows that such a result is not to be reckoned on, for the character of present-day work is not higher on the average than what was carried out ten or twenty years ago.

In investigating the causes of the present condition of labour in the building trades, it seems to us that too much is made of the trades unions and similar organisations. The correspondent of the *Times* has to admit that there are disputes and rivalries among different unions, and after the manner of monopolising capitalists powerful unions do their best to force those which are weaker out of existence. Whilst unionism helps to marshal workmen and to prepare them for contingencies, there are other forces which, we believe, are more effective, and which are too generally ignored. One is the tradition of former injustice.

All who study old records must be aware that there was a time in this country when building workmen, although among the most intelligent of all operatives, were subjected to regulations which now appear as almost tyrannical. If a great building was to be erected, and workmen in the immediate neighbourhood were not sufficiently numerous, those from other districts were forced to migrate there regardless of inconvenience to themselves. The conditions of labour were also severe. We lately referred to the position of building workmen in Beverley. From Easter to the Assumption they were compelled to begin work at four in the morning, and to continue, with intervals for meals, until seven in the evening. At other times the hours were from daybreak to nightfall. If they were tardy, which is now unfortunately the prevailing weakness, or absent, they were fined 12*d.*, which was a large sum in the fifteenth century, and as the money went to the borough funds excuses were not likely to be heeded. As several building workmen were necessarily obliged to keep together, they had not the liberty of independent action which was known in many trades, and in consequence they were more oppressed. Judging by the experience obtained since the passing of the Workmen's Compensation Act, the building trades are the most liable to accidents. But there were no arrangements for any relief resembling modern compensation, and in consequence many families were obliged to suffer. Much has been said about the glories of Mediæval buildings, but the men who erected so many beautiful structures must have had a very hard life.

If he will restrict himself to the circumstances of our time, the building workman can make out a reasonable case to support his claim to be paid high wages. He is expected to possess a knowledge which, however humble, is in its way scientific. The aim is now to induce him to attend technical classes in order that he may gain a knowledge of the theory of his operations, and be able to avoid errors which are dangerous to the community. It is not to be assumed that men who know so much should be paid at a starvation rate. Architects and engineers are always endeavouring to obtain work of an improved quality, and they are not satisfied to see men employed who are unintelligent. Although we may deplore the limitation which the workmen impose on their power of production, it cannot always be said to arise from a love of idleness. People who grumble about building expenses do not realise that the trades have peculiar drawbacks. It should never be forgotten that there are no foreign markets for English builders. The houses or factories which are erected by English workmen in another country or colony are so few, they may be neglected. It is only on edifices in this little island that the workmen can rely for means of subsistence. In many places employment is precarious; the weather prevents continuous work, and through financial obstacles

schemes of building have often to be neglected during lengthened periods. Philosophers who take broad views may say that in periods of ten years or twenty years the usual quantity of work will be found to be despatched, and that the outlay on building will continue to bear its relation exactly to different kinds of expenses. We cannot, however, expect workmen who have to insure the feeding, lodging and clothing of themselves and their families to take philosophic views. Their horizon is limited, and they are to be excused if they endeavour to think of the present moment rather than of a future period.

Nor is it to be supposed that the building workman should be an exception and remain uninfluenced by the desire to lead a more costly existence than his forefathers. Since the time of ADAM SMITH and the rise of political economy the ancient doctrines about self-denial and simplicity of life have been superseded. Those who first sought to raise the status of labourers announced to them that they could not have too many wants, for by seeking for better food, clothing, housing and education for themselves and their families the standard of life would be elevated and the price of labour would be increased. Those who profess to be enlightened have acted on the suggestion, and, as many censors believe, we are fast becoming too luxurious in our habits. It would be absurd to imagine that shrewd bricklayers, carpenters and plasterers should be indifferent to the influences around them and meekly accept wages of the same amount as were given to their grandfathers.

While we readily admit the workmen's claims, and, unless in some moments when there is apprehension that his buildings will not be carried out, there is not an architect who is not disposed to see workmen paid at a fair rate, we must insist that the workmen's own law of production should be modified. If an ordinary bricklayer can set 1,000 bricks in a day without being fatigued it seems absurd that he should spend the whole time in laying one-third the number. If in the intervals he could pursue scientific studies there might be some allowance for his wasted hours, but as it is man must deteriorate under such a system. Workmen who should rejoice in an exhibition of their force and manual dexterity are fast degenerating, and unless there is a change will reach the level of clerks in Government offices. If a compromise could be arranged, and if the price of building in consequence were reduced, it would be better not only for the public, but for the workmen. They should remember, although the fact is not recognised in the unions, that new buildings are not always imperatively demanded, nor must be erected regardless of cost. Examples of that class are rare. Much of the construction which is now carried out is no more than speculative. If the anticipated returns are likely to be diminished by an increased outlay, then capitalists will seek out other modes of investment. There is undoubtedly a limit to what will be paid in most cases, and if a few representatives of the building trades were allowed opportunities to judge of the number of plans and specifications which remain unexecuted at the present time in architects' offices owing to the excessive amount of tenders, they could hardly fail to announce that the men should now abate their demands, or, rather, perform more work than is approved by municipal wirepullers and union organisers.

The argument of the *Times* correspondent is that all trades are alike under the influence of the command that "men are not to put forth their best powers." That, of course, will be explained in the articles which relate to the various industries; but there is no doubt that the completest example of the new system is, unfortunately, to be found in connection with building, and consequently an industry which has claims to take precedence of all others is becoming a menace to honest labour, and an example which cannot be imitated without danger to society.

The Sanitary Committee of the Brighton Town Council recommend that application be made for sanction to borrow, for forty years, a sum of 26,000*l.* for the erection of two new permanent pavilions at the Borough sanatorium, to take the place of the corrugated iron pavilion which the Council were under an agreement with the Local Government Board to remove in May of this year.

NEW BOOKS.—II.

AS evidence of progress there is more assured satisfaction in seeing new editions of technical books than was aroused on their first appearance. A treatise may possess excellent qualities and yet may become a failure, but every new edition is a sign that the book has made its way and that the number of students of the subject which is considered is increasing. Some of the season's examples merit consideration. Thirteen years have elapsed since "A Practical Treatise on Bridge Construction," by Mr. T. CLAXTON FIDDLER, C.E., was brought out by CHARLES GRIFFIN & Co, LTD. The author has since accepted the Professorship of Engineering at University College, Dundee. Several works on the same subject existed, but this treatise has deservedly reached a third edition. One of the characteristics of the book is the extent to which the graphic system is employed in attaining results, and in that way the volume is adapted for the use of those who have not mastered advanced mathematics. The treatise also merits attention on account of the investigations of several of the latest American bridges. It is not to be expected that new discoveries in connection with bridge construction will be forthcoming at regular intervals. Professor FIDDLER has to acknowledge that the important question of working strength remains where it was as described in the first edition. He adds:—"It has not yet been found possible to frame any rules that would meet with general acceptance, nor to define exactly the connection between 'fatigue' and the effect of long-continued vibrations. If we proceed upon the hypothesis that there is no connection, we are logically driven to rules that would condemn as utterly unsafe a large number of existing bridges, and as the bridges remain safe and sound they bear a standing witness against the adoption of any such rules." The subject is one which could easily be made to excite alarm, especially in buildings of one class in which the margin allowed for safety is greatly diminished in order to save expense. The London Building Act, although it defines the thickness of walls, does not insist on any definite ratio between the strain on beams and columns under anticipated loads and the breaking weights. But as the Government, or rather the Board of Trade, are not entirely indifferent to the question, we may conclude that fatigue or dynamic vibrations cannot be assumed as dangerous unless after an indefinite period of time. Professor FIDDLER's treatise embodies the latest knowledge on bridge construction, and as such becomes an efficient guide to practice.

It would be an advantage for a reader if all new editions of books resembled the fourth edition of "A History of Architecture on the Comparative Method," by the late Professor BANISTER FLETCHER and Mr. B. F. FLETCHER, published by Mr. B. T. BATSFORD. To have four editions called for since 1896 can be claimed as a phenomenal success, which sufficiently indicates the merits of the work as well as the augmented interest which is being taken in architecture. Originally the history related to the architecture of Europe, or rather the principal countries in it. In the enlarged edition Indian, Chinese, Japanese, ancient American and Saracenic architecture are also treated. The plates have been increased in number to show examples which will correspond with the additions. It must not be supposed that the old plates reappear in a defective condition, which is the usual state when many impressions are taken. The photographs have been reproduced anew. The geometrical drawings are not reduced and illegible copies of old engravings, but have been especially prepared for this edition. Text and illustrations alike testify to the honest toil of Mr. B. F. FLETCHER, and it is evident that so satisfactory a work could not be produced under other conditions. It may be said that the history has only now assumed its developed form, and later students have been more favoured than their predecessors. The work has been prepared on lines that were laid out with precision, and on that account the book will serve as a companion to volumes on human development, as well as for imparting indispensable knowledge to novices in architecture.

In "Progressive Design for Students" (CHAPMAN & HALL, LTD.), Mr. JAMES WARD, who has already written

some books on ornament, gives such practical lessons as might be expected to be heard from a master in an art school. The ornament described is mainly derived from plant forms, although geometrical and other varieties are introduced. Managers of schools might with advantage pay attention to his suggestion about substituting exercises in design for the usual freehand drawing; for, as he says, Roman and Italian acanthus foliage has had a long innings, and a different class of subject would now be advantageous, as "too much copying of the acanthus foliage in art is dry food for the young student, and is apt to create in him a distaste for his work and to dull his imaginative powers." The dullest student is quickened by any method which evokes his incipient creative power. Mr. WARD begins with border designs which are applications of leaves and flowers. He then explains the adaptation of similar subjects to fill definite spaces. A large number of examples of foliage, flowers, fruit, insects, birds, fish and animals are introduced as suggestive subjects. There is a chapter on brush-drawing, and another on stencilling. In the latter the methods of the Japanese are described, but it has to be admitted that "the sharp, clean cut is such as only the deft fingers of a Japanese can accomplish, and this work is so perfect of its kind that no European can rival or hope to compete with it successfully." Japanese artists are likely to be more amused with English stencilling than with any other class of our art productions, for we seem to be incapable of any finesse when cutting patterns. Interlacing and strapwork ornament is also dealt with, and we are informed that "more than three parts of the ornament and decoration of the savage tribes, and Saracenic or Arabian, Byzantine and Celtic ornament are composed of interlacing lines and strapwork." The perfection of the style is, however, to be found in Arabic work, and for cartouche work no better example could be given than the beautiful cup by WECHTER, which dates from 1620. It is evident that Mr. WARD has had experience as a teacher of ornament, and young students will find his last book a stimulating introduction to ornamental design.

Another volume issued by Messrs. CHAPMAN & HALL is "Perspective for Art Students, Artists and Draughtsmen," by Mr. R. G. HATTON. The author some time ago wrote a book entitled "Figure Drawing and Composition," which gained approval through its original way of presenting the subject. In his "Perspective" he has also departed from the well-worn tracks. He knows that many for whom the science is necessary have not the courage to face geometrical problems, and he therefore endeavours as far as possible to make his diagrams suggestive of something solid which has to be treated perspectively. He recognises that architects' drawings have peculiarities of their own, but, as he says, "A very great deal, nay, possibly as much and more, can be done by the ordinary method which forms the chief part of this book." Mr. HATTON admits that the architects are the only people who can make perspective drawings, for what are accepted as such by students and teachers are impossible geometrical figures drawn by a roundabout process. The Board of Education now expect students to be more familiar than formerly with a perspective that can be turned to account, and nearly a hundred pages of Mr. HATTON's book are devoted to the questions proposed at this year's examinations, and of which he gives solutions and explanations.

A third edition has had to be prepared of Mr. G. H. HURST's "Manual of Painters' Colours, Oil and Varnishes" (CHARLES GRIFFIN & Co., LTD.). The author is a practical chemist and was lecturer on the subject at the Municipal Technical School, Manchester. The pages treat mainly of the manufacture of colours, but also afford information which will be found profitable by those who apply it. Mr. HURST tries to express numerically the covering power, durability and mixability of various paints, but all that can be done in so complicated an inquiry is only an approximation. He recommends the use of Mr. LOVIBOND's "Tintometre" for such investigations. He advises that all who employ coal-tar colours should be careful to make experiments about their durability, and it is explained how simple experiments can be made which will produce trustworthy results. Many will agree with Mr. HURST when he complains that some patent dryers "appear to be made

without the slightest regard to the purpose for which they are used, and some of them undoubtedly have the opposite effect to that desired." Among the patent paints recommended is ORR's white enamel or Charlton white. Mr. HURST says:—"Charlton white is an excellent substitute for white lead; its colour is good, its body is superior to that of white lead; in well-made samples it has about twice the colouring power, and while it possesses the advantages of not being discoloured by sulphuretted hydrogen, by sulphur gases, or pigments, and of being non-poisonous, it mixes well with all vehicles, so that it may be used for all kinds of painting with good results. It mixes with all pigments except those having lead or copper as their base." The words express the opinion of those who have employed Charlton white on a large scale, and the paint has also the quality of being economical. Mr. HURST's book can be recommended as serviceable to house-painters and decorators who are desirous to avoid adulterated compositions and to produce satisfactory work.

A series of photographs with the title "Famous Buildings of London" has been brought out by MARION & Co., LTD. The plates are of large size and have far more softness than the majority of similar views. The buildings selected are the Tower, the Guildhall, the Royal Exchange, the Bank of England, the Mansion House, St. Paul's Cathedral (two views), the Law Courts, Somerset House, the British Museum, the National Gallery, the Horse Guards, the Foreign Office, the Palace of Westminster, Westminster Abbey, St. James's Palace, Buckingham Palace, and the Imperial Institute. The series will form an acceptable and seasonable present to be sent to friends in the country or the colonies by people in London.

The "Practical Engineer's Pocket Book" and "Electrical Pocket Book," issued by the Technical Publishing Company, Limited, at Manchester, are published at a much smaller price than similar compilations. The pages are packed with the facts and formulæ required in everyday business, and each pocket book is an epitome of several larger volumes.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute was held on Monday evening last, Mr. William Emerson, president, in the chair.

The Hon. Secretary announced the decease of the late Mr. F. W. Porter, one of the oldest members of the Institute, an Associate in 1850 and elected Fellow in 1855. Mr. Porter worked mostly in London, and was well known to those who practised in the City. He was district surveyor for Holborn and the East Strand.

The meeting resolved that a letter of condolence should be sent to the family of their deceased colleague.

Mr. R. ANNING BELL read a paper entitled

Notes on Pictorial Mosaic from the Practical Side.

Mosaic, the author said, was a method of artistic expression which had many advantages peculiar to itself, and which also had very definite limitations. It was obvious to anyone who had studied the work of the past that the realistic representation of natural effects, although it had been sometimes remarkably near success, was not the way to get the greatest beauty possible out of the material. The material proclaimed itself at the outset as being unsuitable for realistic effects for two reasons. The first and strongest was the uniformity of its surface, which rendered it impossible to get that variety in the texture of the material which was the special reason why oil paint was so triumphantly superior to any other material in the rendering of the look of nature; the second, the fact that it had to be applied in separate pieces with an interval, however small, between them. The tints could shade off into each other with quite the subtlety of paint, and the interstices formed a lacework of ground colour and shadow which was the same all over the surface, and added to the monotony of the texture. The material, therefore, commanded a certain flatness as the effect to be aimed at, and, as a corollary to this, a certain archaism or stiffness in the design. This very flatness of effect imposed some restraint on the style of the design. It was not truly archaic, but was the fullest expression which the limits of the material permitted, and gave an artist plenty of elbow room for his invention if he had any feeling for the method. For pictorial mosaic the subjects chosen must be such as are suitable to austere treatment. The play of facial expression or momentary gesture was out of court. The characters introduced could be likenesses, or the occasion of their introduction a mere incident; the characters should be types, the incidents symbolic.

Discussing the practical questions of working and placing the mosaic, the author said that it should be some way from the eye and a good deal higher up. Like many other good things, when you want it you want a lot of it; it is best of all when entirely covering a large space and unbroken by architectural mouldings. This applies more particularly to gold mosaic, which, when covering walls and domes, running round the arches, flashing into a glistening flake of light as it turns the corner, and covering every inch of space above the capitals of the columns, is much more satisfactory in effect than when used in juxtaposition with stout arch mouldings and pilasters. Small panels of mosaic, the author said, he did not like at all, even where they are merely filled with conventional foliage, though that is better than the clumsy look of small figures close beside the smooth and exact forms of the mouldings which frame them.

In interior work gold mosaic—a treatment, that is, in which gold is largely employed—seems to be infinitely superior in effect to a treatment in colours only. For external work the use of gold was considered a mistake. First, from the practical side, owing to the construction of the tesserae, it was likely to be damaged by frost, as the film of glass which covered the gold leaf was very easily flaked off should any water get into the interstices; and secondly, from the æsthetic side, there was no mystery of shadow to bring out its peculiar beauties; it glittered so strongly in sunshine as to destroy the effect of the design of which it formed part, and it was inclined to look rather garish even in ordinary daylight.

Treating of colour, a light scheme was advised as preferable to a deep one. The cooler colours are pleasanter than the warm ones when used in any quantity. Much orange is peculiarly unpleasant, and even reds should be sparingly employed, and rather as accents to strengthen other colours than in masses for their own sakes. Blues and greens tell well at a distance; they have a charming quality, will keep their colour very fairly, though one needs to use a much stronger blue than might be expected if it is to be at all rich in effect. It may be taken as a general rule that differences of any light tints carry much further and tell much more strongly at a distance than similar differences in a lower key. In whites a very slight variety will have a very marked effect, and it will tell less close to than some way off, whereas quite the opposite is true of strong colours, particularly of red. Difference of quality in the glass has also a marked effect on its carrying power.

As regards tesserae, very great differences of size are inadvisable in figurework. A few large pieces among a large number of small pieces is unsatisfactory. If, however, large pieces are mainly used, a few small pieces here and there will rather enhance the effect. As an interesting example of this, Mr. Beresford Pite's mosaic outside Pergami's Restaurant was cited. The effect is quite unlike what we are used to in mosaic, but the author would like to see more work done in this method. It has many advantages in a place like London. Dirt cannot easily settle on it, and when it does it is easily washed off. It is permanent, and as the pieces are so large, less labour is required than with ordinary mosaic. For outside work the author found that a scale larger than was generally seen in old work might be used with good effect. Should varying sizes of tesserae be used generally over the work, any place where they are kept of uniform size will infallibly attract the attention by its regularity; this would be seen in a pilaster forming part of the background of the panel at Horniman's Museum.

Careful study should be given to the size of the interstices. In background work they can be quite large if the colour is not wanted to be very pure, the dull tint of the putty toning down or saddening brighter colouring. In such parts as faces, hands, or other details to which particular attention should be attracted, they may be quite close together, so making a comparatively solid mass of colour, and giving emphasis to the part. In fact, it would be difficult to work a face without keeping the tesserae close, as the tone of the interspaces would destroy the quiet modelling, which is all that is necessary or advisable.

Remembering the limitations of the material, anything like truth of relative values or strength in the general effect of light and shade should not be attempted. Simplicity in modelling is desired. Variety of tone as much as is necessary is obtainable by the relative strength of the colours used in different parts of the design. Realism of texture in draperies or other accessories should be avoided; trees, buildings, clouds, textiles, &c., should be felt to be rather symbols of those things than actual representations of them.

The author then treated of various matters and difficulties connected with the actual work of putting the mosaic upon the wall. His preference was for the method of doing the work *in situ*; a good result cannot possibly be obtained by other means. The modern Italian way is open to the obvious objection that you cannot see the progress of the work, and it is impossible to make alterations as you go on.

In translating the water-colour or pastel tints of the cartoons into coloured glass, a good deal of variety is possible, so that it is necessary to be always in touch with the workers to discuss with them which tint and quality of glass shall be used, and sometimes to vary from the cartoon when the work already finished may suggest it. There is great variation in the work as done by different workers. The setting of the mosaic is an essentially artistic craft; it is absurd of the designer-in-chief to say simply, "Here is my cartoon, take it and copy it exactly." It is impossible to copy it anything like exactly, and consequently complete co-operation between designer and craftsman or craftswoman—for it is one of the things that women do admirably—is absolutely necessary.

Though the most splendid, as it is the most permanent form of wall or ceiling adornment, mosaic is extremely arbitrary, and any attempt to stretch its limits is terribly punished. It will not easily put up with rivalry, and will not endure other methods of decoration in immediate juxtaposition. In interior work it quarrels with stained glass, and it destroys gilding, as may be seen in many a Roman church, and nearer home than that, where the choir-arch and columns are gilt around an apse of mosaic. Outside, the mosaic must be made the dominant feature in the scheme of which it forms part. No colour can stand near it but in humble subordination, and its surface texture requires considerable art and discretion in the choice of neighbouring materials. Nobly used it nobly repays; ignobly used it does nothing but disgust.

Mr. G. FRAMPTON, A.R.A., in proposing a vote of thanks for the paper, said he felt that Mr. Bell, with others who worked in mosaics, were really doing a great service in the art and architecture of this country. Compared with modern work on the Continent in the material, he believed that we had in our half-dozen men in England the finest workers in mosaic in the world. In the past Titian and other men had made mosaics, but they failed because they lacked the knowledge of architecture, and it seemed impossible for an artist to be a decorator unless he had been through an architectural training or possessed a deep love and feeling for the art. In Paris one could see good examples of outside decoration in mosaic, but all French work was not pleasing. The Panthéon in many places failed in its decorative treatment. Realism did not go with architecture. The speaker disliked strong black shadows in design.

Mr. WALTER CRANE seconded the vote, and said he agreed with the principles expressed in Mr. Bell's paper. The work of mosaics was of the nature of a built wall, and few things were more satisfactory than the good joints in brickwork. The extended use of the joints, which were the essential parts of the work, helped the design as a half-tone ground served a painting. Gold used externally was perhaps garish, but such an effect might disappear if it was not applied to a flat surface. It was possible to reproduce a cartoon, and he had found all the variations very faithfully copied when the tesserae were laid over the design. The work by this method was uninteresting to the workmen, but the fidelity of the reproduction was astonishing.

Mr. C. H. TOWNSEND said a certain form and finality given to the figure in mosaicwork were unhappily apt to be classed by those who did not understand the art as an attempt, and a slavish attempt, to imitate the method of work of those who had practised in earlier times. The artist showed his power in the influence the material had over his design, and a recognition of the limitations of that material. There could be no facial expression in mosaic. The face and all representations of nature could only be symbolical and emblematical. The price for such sacrifices was repaid, however, to the artist in the durability of his work. Mosaic was an imperishable material, and could stand all the vicissitudes of climate, handing down to men 500 years after the artist had perished his colour scheme as he had left it. The decadence of mosaicwork curiously coincided with the attainment of a perfect cement. Up to the year 1500 men had been working with lime cements, but in 1528 oil was used in the cement, and this enabled artists to obtain other effects in their work. The setting of the oil cement was slower and allowed of deliberation and alteration. Men were tempted to draw more ambitiously than they had done, and the art lost its purpose.

Mr. G. BRIDGE, speaking of the making of putty or cement, said the boiled oil should be mixed with lime two or more years old.

The PRESIDENT at the close of the meeting announced that Mr. Lacy W. Ridge had given notice that at the meeting on December 2 he would move the following resolution:—"That the Royal Institute of British Architects desires to thank the Local Government Board for the issue of 'Model By-laws IV. (Rural Districts).' While doing so, the Royal Institute would urge on the Board the desirability of preparing a model to enable rural district councils to regulate party walls as distinct from external walls, a matter for which the urban model by-laws, to which the Board refer them, are not available. The Institute grounds this on the belief that the existence of

properly constructed party walls has proved an efficient barrier to the spread of fire, and that it is undesirable that such protection should be withdrawn in places where it has already existed."

Mr. HERBERT W. WILLS also gave notice that he would move the following resolution:—"That in the interests of the profession it would be advisable to have a list of Institute assessors drawn up from whom the President would nominate, and that this list be from year to year revised."

CHRIST'S HOSPITAL SCHOOLS.

THE autumnal tints in the thickly-wooded surroundings of Christ's Hospital, near Horsham, are in their full richness. Charming as the neighbourhood is in springtime and summer, autumn possesses an attractiveness peculiarly its own. In whatever quarter one looks, the landscape is resplendent with the golden and crimson coloured leaves, which in the midday sun lend additional attraction to the view. Looking across West Horsham from Tower Hill the scene is very picturesque. Above the trees the magnificent range of buildings known as the Christ's Hospital schools, with their stately and dignified turrets, can be seen. The ground upon which these schools now stand was but a few years since a centre of activity in dairy farming; within less than a year it will be the home of one of the largest historical educational institutions of the world. With perhaps the exception of the chapel, which is now being erected, all the other buildings, says the *Sussex Daily News*, are finished. Interior work is rapidly progressing; statues are being put in their specified positions, the electric-light installation is being pushed forward, the ornamental grounds are being laid out with graceful and picturesque effect. These and many others are indications of the progress being made.

Perhaps the most interesting portion of the work at the present time is the fixing of the various statues in their defined positions. This is not by any means an easy task considering the fact that some weigh nearly a ton, and it speaks highly for the skill and care shown when it is stated that statues have been removed from the ancient building in Newgate, transferred to the new school, and raised and fixed on alcoves at a great height without being in the least damaged. In order that the school should retain some of its ancient associations the whole of the brickwork around the alcoves was transferred from the old school to the new. Another important work is the cleaning and restoration of the famous school picture. This work is of considerable importance and requires a great amount of delicate treatment, and it is gratifying to know that it has been admirably carried out by Mr. C. W. Carey, curator of the picture gallery at the Royal Holloway College, Egham. This picture, which next spring will be hung in the dining-hall, is 90 feet in length and 15 feet high, and for the purpose of removing, it was found necessary to cut the canvas in three pieces. The tablet to be affixed to this picture states:—

"This monumental picture, the work of Antonio Verrio, was designed and painted in 1684-90 to commemorate the foundation and endowment of this hospital and the Royal Mathematical School by His Majesty King Charles II. by letters patent in 1673 and 1675."

In an interview with the representative of the *Sussex Daily News* Mr. Carey alluded to the controversy which had arisen respecting the centre figure, as to whether it was Charles II. or James II. Mr. Carey was of opinion that it represented James II. He said Verrio having been engaged some years upon the picture, he probably completed the middle part of it during the first two or three years of the dates given on the tablet. Samuel Pepys, at whose instigation the picture was painted, had some difficulty in getting Verrio to finish it, and said the sides of the huge painting were probably hurried off at a later date by him and his assistants. This accounted for some of the work at the sides being inferior to the centre piece. The notorious Justice Jefferies and Samuel Pepys are portrayed, and also the founder, Edward VI, while the Lord Mayor, in a red robe, is drawing the king's attention to the work of the scholars, the head-master being in a kneeling position before a globe representing the world. On the right of the picture behind the head-master are depicted the boys, and on the left of the canvas are the girls, while the masters and professors are also represented, together with Verrio, whose back, however, is only shown, as he has turned and is presumably speaking to the attendants. The picture when hung will have a new frame of Oregon pine, the ceiling of the huge dining-room being of similar wood. The famous picture has now been thoroughly cleaned and restored, and has undergone quite a transformation.

Another ancient picture of the school, representing King Edward VI. presenting the Charter to the Lord Mayor of London, is extremely interesting. The Lord Mayor and the aldermen of the City are depicted, as well as the governors and masters of the school. Bishop Ridley in his robes also occu-

pies a prominent position, and the boys on one side and girls on the other are admirably portrayed. The tablet states:—"This great picture, attributed to Hans Holbein, commemorates the incorporation by the future King Edward VI., of pious memory, of the three royal hospitals of Christ, Bridewell and St. Thomas the Apostle by a common Charter dated June 26, 1553." This picture, reputed to be by Holbein, was considered by Mr. Carey to be the work of Sir Antonio More, Holbein having died before the incident depicted in the painting took place. More was a Dutchman, educated by a Dutch painter, and this was practically equal to being a Flemish painter. He then went to Italy and studied for a few years. Afterwards he proceeded to Spain, where he became eminent. He was then sent over to England by Charles V. to paint the portrait of Queen Mary for her future husband Philip. More was so successful in England that Queen Mary appointed him Court painter. He came to England about the year that the incident in the painting happened. The picture is placed temporarily in the library. The picture, when in the old schools, was indistinguishable owing to dirt and dust. Having had the varnish carefully removed, the picture underwent a thorough process of restoration, and the original colours are now showing with considerable richness. It is hardly probable that anyone living has seen the figures so clearly and vividly. In his delicate and difficult work of restoration Mr. Carey has been most ably assisted by Mr. Ralph Warner. Those who have been fortunate enough to visit the schools have been received with the utmost courtesy by Mr. Harry W. Tingley, manager of the works, and Mr. James Proudfoot, clerk of the works.

THE MANCHESTER SOCIETY OF ARCHITECTS.

A MEETING of this Society was held in the rooms of the Chamber of Commerce on the evening of the 14th inst., presided over by Mr. Darbishire, to hear a paper by Mr. Paul Waterhouse on "Architecture." Mr. Waterhouse said he took it to be an axiom that the greatest periods of historic art had been those in which there was no consciousness of art; that in fact consciousness in art was a danger to its existence. He would during his paper inquire whether we were to look upon the modern practice of analysing the very nature of art as a necessary menace to our powers of art production. Our age was above all, he said, an age of expression, and in architecture especially the powers which made the critic were, he thought, allied to those which made the producer. In fact, the very mental exercises that enabled us in these days to define and detect that essence of art which was unnameable to our forefathers were not necessarily destructive of creative skill, but might be turned, at least so far as architecture was concerned, into the instrument of a riper, fuller and more intellectual creation. After speaking of the simplicity which underlay Greek art, the beauty of some of the best specimens of Roman architecture, and the buildings of the Italian Renaissance, which last, he said, breathed the very essence of art, the speaker emphasised the fact that art, as we understood the word, was never talked about by their builders. In the great Gothic days the mason was a skilled craftsman who was imbued with a simple pride in his work, which was to him an expression of pious faith and Christian belief; but the mason would have been quite unable to talk about his work. Until the present age art was cherished and beloved, but never talked of. We had, however, to-day the wish, and sometimes the ability to express things which a former age would never have attempted to handle. Each preceding age had a style of architecture of its own. To-day an unconscious selection was exercised, but all noble work had its traditions in recognised styles, and was more or less the result of an academic choice. No architect to-day could consider himself equipped for his work without a sound knowledge of the elements in which he worked. So far from being choked, as some argued, by deeper insight, the architect must necessarily be a student. He attained the highest possible to him only when he could criticise his own work in the light of knowledge. Architecture was, so to speak, the application of taste to construction, therefore only the man of wide knowledge could be trusted to vary or modify the old rules, since his power to judge depended upon his knowledge of the work of his predecessors. Architecture was creative and arose from the divine in a man. As its name implied, it was the queen of crafts; the architect was not an imitator, but a creator.

At the monthly sessional papers meeting there was an exhibition of students' drawings, and the following prize-winners were announced:—

Design for a small plunge bath, Mr. Gerald Salomons. For the sketches in connection with the summer visits:—1st prize, Mr. Frank Osler; 2nd prize, Mr. Gerald Salomons. For measured drawings:—1st prize, Mr. Claude Paterson; 2nd prize, Mr. Gerald Salomons.

NOTES AND COMMENTS.

ON the preceding page we give a plan which Mr. HENRY L. FLORENCE has sent us. It shows a new road which he proposes should be formed across the Green Park, continuing the line of Jermyn Street and Bennett Street to the arch in Constitution Hill. This scheme, says Mr. FLORENCE, "would be inexpensive to carry out compared with any other I have yet seen, as by it only one house in Arlington Street has to be acquired, the new road through the park parallel with Piccadilly would be made at small cost, the underground lavatories and conveniences recently formed next Walsingham House would be undisturbed and the amenities of the Green Park would not be injuriously affected, as only a few trees would have to be removed."

It is to be hoped that the London County Council will not act precipitately in adopting the proposals of the syndicate that has offered to purchase, or to take on a long lease, the site which will be available on the north side of the Strand between the two arms of the new thoroughfare to Holborn. Public bodies are not indifferent to their own ease, and it is a temptation to get rid by one stroke of all the difficulties which are connected with the laying out of the site. The expenditure of about two millions sterling on the building has also an attraction for those who profess anxiety about finding employment for the working classes of London. But the innovation of a colossal building which may have all the plainness of the American "skyscraper" is not entirely without drawbacks. For the Anglo-American syndicate it might be an advantage to have a building of marked peculiarity, but metropolitan interests would not be served if all the buildings in the neighbourhood suffered in consequence. We do not anticipate that the new office block will excell all the other buildings of the Strand in beauty. In spite of the novelty we expect, unless it differs greatly from its American prototypes, it will be considered as inferior to them in appearance. The experiments in lofty buildings which we have already in London are not encouraging. Nor is there at present any marked necessity for the new enterprise. Offices are now easily obtained in the Strand, and they will abound in the new thoroughfare. There is also no one class of business which is dominant and likely to increase. Lawyers have not hitherto shown much eagerness to possess offices in the Strand. All these matters should be carefully investigated before a decision is arrived at. Although for the moment it may be believed desirable that we should Americanise our ways, it does not follow that one of the principal streets of the Metropolis should in any sense be sacrificed for that purpose.

THE Workmen's Compensation Act declares that "where total or partial incapacity for work results from the injury, a weekly payment during the incapacity after the second week not exceeding 50 per cent. of his average weekly earnings during the previous twelve months, if he has been so long employed, is to be the extent of the compensation." Can a firm of builders who have respected the conditions just mentioned to the letter be made defendants in an action under the Act? From most lawyers the answer would be in the negative; but the Workmen's Compensation Act is *sui generis*, and Messrs. LONGDEN & SONS have found themselves in the position of litigants because they faithfully observed the law. A bricklayer's labourer in their employment, whose wages were 30s. a week, met with an accident in October 1900. A fortnight afterwards the payment of 15s. a week began, and was continued until April 1901. Then they received a letter from the man's solicitor making a claim for compensation. The employers replied they were paying the full allowance, and were willing to continue it during the man's incapacity. Afterwards a sum of money was mentioned by the labourer. At Messrs. LONGDEN'S instance there was a medical examination, and they offered the sum which they regarded as sufficient. Then the case was brought into the Sheffield County Court, the labourer saying that, although Messrs. LONGDEN never disputed their liability and made him an allowance,

they never admitted it. Messrs. LONGDEN contended there was no question to arbitrate upon, but the judge made an order for a weekly payment of 15s. during incapacity. Messrs. LONGDEN appealed, and all the members of the Court delivered judgment in their favour. The Master of the Rolls held there was no question in dispute, and on that ground allowed the appeal. It would be strange if any other decision were arrived at. We are all supposed to obey the law, and it would be absurd if every person with whom we come in contact, and who may be injured if we act illegally, should insist on our entering into an agreement that we are willing to obey the law on some particular point. If something wrong is done, then there is occasion to be bound over to keep the peace, but to be bound over to all conditions of men would not be more ridiculous than the obtaining of a decree compelling an employer to pay the compensation which he had been paying willingly for several months.

ACCORDING to the rules of the Salon, a painter can only send two oil-paintings each year to the exhibition. In a case where one of the works should assume the form of a diptych or a triptych it will be left for the jury to decide whether it is acceptable as a single work. Some members of the Society of French Artists think that the English system, by which a Royal Academician is allowed to contribute several works to an exhibition, is preferable. Accordingly it has been proposed that forty of the French artists should have the privilege of exhibiting from five to eight works every year. The principle was adopted; but some of the best known members of the Society are of opinion that the innovation may become another cause of disunion by means of which French artists will be still more divided than they are at the present time. The subject was afterwards brought before the committee of ninety members, but their decision was in favour of the continuance of the existing arrangements.

ALTHOUGH the ancient Priory of the Knights of St. John of Jerusalem was suppressed in 1540, and the building which was erected to take the place of one destroyed by WAT TYLER was overthrown, Clerkenwell still retains by means of names some associations with the great order. We still have St. John's Gate, St. John's Street and St. John's Church. It was in the vault of the latter that Dr. SAMUEL JOHNSON and other philosophers attended to hear the revelations of the "Cock Lane Ghost," and were disappointed as they might have anticipated. The vault or crypt has now a chance of becoming better known. The London County Council have arranged to widen St. John Street, and for that purpose will take a portion of the churchyard. The rector regarded the proposal in a manner that is worthy of an archæologist. He suggested that as the Council would have some vacant ground contiguous to the church, they should give a piece of it for the purpose of affording additional light to the old crypt in exchange for the portion of the churchyard which they proposed to take. The County Council agreed to the rector's suggestion, and, in addition to giving the piece of land for the lighting of the crypt, they propose to lay out another piece of ground as an open space for the benefit of the neighbourhood. Care is also being taken to preserve the remains of the ancient Priory, and any further relics of it which are found in carrying out the widening of the street are to be preserved in the same way and not removed to a museum. Any ancient monuments which will be found are to be placed in the crypt. An application for a faculty which was made by the London County Council was at once agreed to by the Chancellor of the diocese of London.

THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. G. B. Carvill, vice president, in the chair. The following were elected members:—Messrs. E. S. Carr, J. C. Bucknill, F. Bisset, W. J. Delbridge, J. H. Goodfield, C. L. Hampton, G. O. Howship, A. S. Jones, E. J. Allenborn, E. G. Millar, D. W. Pollock, E. Pitt, H. Sandford, J. M. Thomasson, A. H. Whyte and E. H. Walker.

The Vice-President read the following list of donations ready given or promised to the New Premises Fund:—Mr. Macvicar Anderson, 250*l.*; the late Arthur Cates, 250*l.*; Mr. Henry L. Florence, 250*l.*; Mr. Arnold Mitchell, 200*l.*; Mr. John Webb, A.R.A., 200*l.*; Mr. E. A. Gruning, 100*l.*; Mr. Alfred Waterhouse, R.A., and Mr. Paul Waterhouse, 100*l.*; Mr. A. Brumwell Thomas, 52*l.* 10*s.*; Mr. William Emerson, 50*l.*; Mr. T. M. Rickman, 50*l.*; Mr. W. H. Seth-Smith, 50*l.*; the late Mr. William Young, 50*l.*; Mr. J. A. Gotch, 31*l.* 10*s.*; Mr. Reginald T. Blomfield, 25*l.*; Mr. G. A. Fellowes-Prynn, 25*l.*; Mr. A. E. Street, 21*l.*; Mr. A. T. Bolton, 10*l.*; Mr. R. P. Jones, 10*l.*; Mr. Walter Emden, 5*l.* 5*s.*; Mr. W. L. Trant Brown, 5*s.*; Mr. C. J. Blomfield and Mr. A. C. Blomfield, 5*l.* 5*s.*

The announcement was received with loud applause.

Mr. MAX CLARKE read a paper entitled

The Sanitation of a Country House.

I have been wondering since the committee of the Architectural Association asked me to read a paper on this subject whether they paid as great a compliment to the members as they did to me. That, I suppose, must be settled by each member for himself. As a rule, "sanitation" is looked upon as a matter to be got over with the least amount of trouble possible. When I say this you must bear in mind that I do not see as a sanitarian; I simply look at this branch of the duties of an architect in the same light as I do any of the multifarious matters he is called upon to deal with for the usual 5 per cent. Let me tell you how it came about that I was led to think seriously of the particular matter under consideration this evening. Many years ago I was walking through the streets of a provincial city with a friend; he had with him a clerk of works, who was engaged upon some of the buildings in course of erection, and had been upon others. Pointing to a pipe against a wall, this gentleman said, as well as I recollect, "The authorities are under the impression that is a ventilation pipe, but I just stuck the end of it into the ground, and it looks right and does no harm." This remark made a great impression upon me, as I could not help turning over in my mind, Were the authorities at fault in asking for a ventilating pipe or was the man at fault in so deceiving them? I always suppose the architect knew nothing of the transaction, but he could have done so if he did his duty.

Now, gentlemen, let me for a moment substitute the word "hygiene" for "sanitation." The explanation in a dictionary of the word "sanitary" is "pertaining to, or designed to secure health," and of the word "hygiene" "the science which treats the preservation of health." There does not seem such a difference between the two definitions that I might not substitute the latter for the former word. Now I must ask you to join with me to the introduction to Parkes's "Hygiene." The first paragraph is as follows:—"Hygiene is the art of preserving health—that is, of obtaining the most perfect action of body and mind during as long a period as is consistent with the laws of life. In other words, it aims at rendering growth more perfect, decay less rapid, life more vigorous, death more remote." This paragraph I consider the most admirable definition of "Hygiene." I should like to read to you the whole of the introduction, but time will not permit, and I can only suggest that each member, at least each junior member present, and also those who may look over this paper in print, should carefully read over and consider the whole of this introduction to Parkes's "Hygiene."

Just fancy for the architect what the above paragraph means; that each one has it in his power to assist in such an endeavour, which, if carried out, would alter in a great measure the whole state of mankind, because that is what it really means, "the most perfect action of the body and mind." Is it not what we are all aiming at in various ways, or should we? Now, let me ask, How many of the architects in the United Kingdom have a copy of this particular work in their library? How many have given it the consideration it deserves, or deem it one of the main objects of their lives to further the objects it treats of? If I can only bring some of them, and particularly some of the rising generation, to realise that "The Art of Architecture" embraces such a duty to the whole of mankind, I shall have accomplished something. There are many different views as to what the duties of an architect are. They seem to me largely to turn on how much an architect should do or can do for 5 per cent. Lengthy articles have been written on his duties as an arbitrator and such like, but where does one read of his duties in rendering growth more perfect, decay less rapid, life more vigorous and death more remote?

The other day the address of our President contained a paragraph to the following effect:—

"It is a fault in our training that our pupils are not on the works enough, and that we do not specialise enough. Highly trained men, with a diploma from a guild or an institute or what not, ought really, if our building is to be of our best, to confine themselves to design and the supervision of building construction, and not to meddle with surveying, valuations and dilapidations, bills, &c, work which certainly does not savour of art."

Might he not have added to the list "sanitary engineering?" It really is a most difficult matter, at least to my mind, to decide what we should do ourselves and what leave to others; for my own part I see nothing wrong in employing another man to do that for me which I know he can do better than I could myself; the only difficulty to me is, who is to pay him? Personally I feel I should if I undertook to do work for such and such a percentage, and if I were quite sure that my client got the advantage of the best information on the subject.

Now you may say, What has all this to do with the "Sanitation of a Country House?" and my reply is this, that I look upon the title of the paper from the very broadest point of view; it not only concerns the drains and pipes, but it deals with almost the whole structure from foundations to roof-tree, and it is only by an architect having in view the benefit of the whole community at large, that he will have fulfilled his duty to mankind in general and his client in particular, not to speak of himself, because no matter what the matter in hand may be, he is morally, if not legally, responsible for the result of his work, whether, in fact, it is a benefit to posterity or the reverse. I do not think this view of the case is brought home often enough to architects, and I take this opportunity of pressing it upon the younger members of the Association, for it is to those I am here to speak; the older ones, I hope, know as much about sanitation and hygiene as I do myself. Whether these two items always get the consideration they deserve from men in practice is a question.

My friends say that I am very prone to deal in facts when generalities would, in their opinion, answer, and my reply is that I think the more one gets to what some call "rock bottom" the better will our work be, whether it be as an art or profession, so I am going to give you a few instances of cases which have come before me. Some few years ago I had something to do with a building where the architect had, I presume, great confidence in his clerk of works and foreman; at any rate, they were given a plan of the drains; it was neither very good nor very bad, and the work was done. A short time afterwards, from various causes, the drains were overhauled, and it was found that there was one length of 9-inch pipe into which several 6-inch pipes were branched, and on the 9-inch pipe, between each of the 6-inch branches, a 9-inch syphon trap was discovered, each trap being quite blocked up with soil; so far as I recollect there were five traps in a length of about 60 feet.

I heard of a case the other day, equally interesting, but from another point of view. A house in the country—fortunately I do not know either the neighbourhood or the architect—built not long ago, lately from some cause the drainage had to be examined and was found to be defective. An architect was of course employed to put matters right, and his way of doing it was to write a letter to a builder instructing him to test the drains and put in new where he considered necessary, no supervision beyond a casual inspection being exercised over the country builder or what he "considered necessary."

I need hardly tell you my point is, that papers might be read here and elsewhere till doomsday without any practical result, unless men take a different view of their responsibilities from those I have just quoted.

Having pointed out to you what I consider the responsibilities of an architect are in connection with sanitation, it now remains to get an idea what are the sanitary requirements of any house, as I do not believe we should build any worse for the poor than we should for the rich, so far as sanitation goes.

We need not consider site, aspect or prospect, as it seldom falls to the lot of an architect to decide on the first, and any man worthy of the name of architect would deal to the best of his ability with the two latter items, on which there is plenty of information to be had, and they are not matters which require supervision.

Subsoil Drainage.

The lie of the ground requires most careful consideration, and the drainage of the subsoil, if such is required, always bearing in mind that it is better to lay land drains so that they will convey water away from the house than towards it. I mention this, as I saw a scheme a little time ago arranged to convey all the surface water in a pipe under the centre of a house when it would have been quite possible to take it away at the sides of the house. Land drains or agricultural pipes are liable to get blocked up at times, which should be borne in mind when laying them. The general drainage I shall speak of later.

Foundations and Concrete.

The foundations should receive careful consideration even in the country, taking care in a clay district to carry them well down beyond the level which may be affected by droughts; if this were done we should not hear of so many cracked buildings and underpinning jobs, which, though money-making for the architect, are not pleasant for the client.

In connection with the foundations, let me remind you that Portland cement requires more examination and attention than it usually receives from architects. I find it very difficult to get it sufficiently air-slaked—or, in other words, it is, as a rule, used when it is too fresh; it sets so rapidly that it is partly set before it is used in brickwork, drainwork or concrete, and if knocked up again of course it is not the least use; it is also more likely to blow or expand when used fresh, accounting for the number of stoneware pipe-collars fractured which are to be met with.

Damp Courses Over Area of Buildings.

Covering the area of buildings with Portland cement concrete, as required by many authorities, is for the purpose of keeping down ground damp, which, where there is no concrete or other damp-proof course, is liable to be drawn up in the building when the latter is heated, the damp or noxious gas sometimes coming from great distances where the earth is light or porous. In this way sewer gas may be brought into a building from defective sewers existing at a considerable distance. In order to prevent this, care should be taken that the cement is sound and slow-setting, and that the concrete is not porous; the aggregate not being too large, such for instance as brick-bats which one often sees in concrete. The surface should be well beaten down and smoothed over with a shovel so as to form an impervious face, even if the concrete is only to act as a damp-proof course, and not as a floor.

Damp Courses.

Damp courses in walls should receive great attention. The very old-fashioned clause to be found in specifications, "two courses of stout old slates bedded in cement" should, I suggest, be abolished, as it is most difficult to get stout slates, either old or new, the usual type being so very thin that they break easily and are often damaged before the wall is built upon them. Asphalte often suffers from being laid upon the walls and then used as a gangway by the men on the works, or is otherwise damaged by moving materials upon the walls before the brickwork is continued up over the damp course. Whatever the material may be, it should be carefully protected until the superincumbent walls are built, then we may assume that we have done all that can be done to insure a perfect layer of material to prevent damp rising. I do not give an opinion as to the best material to use, only care should be taken in its use. In connection with damp courses and floors, I doubt if sufficient attention is paid to cases where there are wood floors with a space under, one side of a wall and tiles or mosaic with concrete under at the other side. Then some precaution is required to prevent the damp getting from the earth and concrete on the side of the wall to the flooring and timbers on the other side.

Numerous methods can be adopted, but they are usually conspicuous by their absence.

Vertical Damp Courses.

Vertical damp courses or dry areas are most important to rooms underground. I do not think there can be any doubt that, where a wide area cannot be obtained, covering the external face of the walls with a double thickness of asphalte is the very best means of keeping out damp, the asphalte forming a horizontal damp course at the bottom and extending vertically above the level of the surrounding earth. My experience of hot compositions poured into a cavity in the wall is, that such care is necessary to prevent mortar droppings getting down, and to insure the hot material getting down and adhering to that already in, I shall not risk it. The external application I can see and examine, the internal I have no means of knowing whether it is in as it should be or not.

Ventilation under floors should be attended to, sleeper walls being built open to allow of currents of air through the open spaces. One forgets at times that putting in an air brick to the space under one room and carrying up the brickwork close under the floor all round without any openings other than the one is not "ventilation," it is only leaving a hole. All holes made in walls should have a fall outwards to prevent wet being driven in.

Bedding wall or pole-plates in main walls at the ground level is a mistake; they should always be carried on corbels, piers or independent walls. In connection with this, I think hoop-iron, well tarred and sanded, is to be preferred to wood wall-plates.

Walls.

With regard to walls, what shall I say? That you should avoid, if possible, using 9-inch walls. It is not sanitary work,

in my opinion, to build a house costing, say, 2,000*l.*, all the outer walls being 9-inch brick; and particularly when the bricks are porous, as so many are nowadays, put together with poor mortar and not even damped before laying. Of all the simple requirements in building I do not think there is any single one I have so much difficulty in getting carried out as wetting the bricks well before they are laid; if this is not done the dry brick absorbs all the moisture out of the mortar so rapidly that the material is little better than dust or dry mud. Hollow walls require attention to see that the cavity extends below the level of the internal damp course; also that mortar is not allowed to drop down the cavity and rest on the wall, thus forming a means for the damp to pass from the exterior to the interior lining of the wall. The lead covering of lintels or arches over openings in hollow walls requires attention to insure the ends of the lead being welted and turned so as to direct the moisture to the outer wall.

I have had some experience in building with granite, and I find it is a mistake to allow through or bond stones to extend to the inside face of the wall, as damp patches are usually found where the ends of these stones come. This is, of course, where neither brick lining nor "strapping" (the Scotch term for battening and plaster) are used.

Roofs.

Some points in roofs require attention; one of the most important, to my mind, being in cases where eaves gutters rest on the tops of walls or on oversailing courses. It is a practical impossibility to make a cast-iron eaves gutter perfectly watertight, therefore short lengths of lead should be fixed on the top of the walls at each joint in the gutter to take the water which escapes from the joint away beyond the face of the wall, not allowing it to percolate into the brick and stone, and so form a very unsanitary spot, as well as an eyesore on the inside. These pieces of lead should be welted at two edges, and of the other two edges the back should be turned up and the front edge turned slightly down where beyond the outer face of the wall.

Down pipes are, as a rule, too large and too numerous in most buildings, where gulleys have to be fixed at the bottom of each stack, involving unnecessary drains and extra work clearing out, &c. The pipes should always be fixed so that they are clear of the walls in case of leakage.

I would suggest that "soakers," which are more usual in the north than in the south, are better in every way than either secret gutters or flashing, the cover flashing being less liable to damage than flashing laid on roof slates. Soakers also make a good finish to hips where the taste of the architect does not permit of hip tiles, slate or lead coverings; the slates can be cut to a close joint down the angle. Slates of a greater width than the ordinary size should be used in these positions, so that no very narrow strips or small angle pieces are used, as these usually have only one nail or peg, and are very liable to get broken and fall off.

I think two courses of slating battens, the lower one vertical and the upper horizontal, is a good method of obtaining an air space in roof construction, and so rendering the interior less liable to be affected by changes of temperature. Felt should be clearly specified and examined as to quality, the cheapest, which is often seen on work, is not a desirable article.

Silicate cotton or slag-wool is a most admirable non-conductor, as well as being a sanitary material, to be used in almost all cases where hair felt is so often used, the latter being a happy hunting-ground for all sorts of vermin, whereas the slag wool is, to them, most objectionable; this applies to roof coverings, pugging in floors, "lagging" or covering pipes of all sorts, and all the other purposes a good non-conducting material is used for.

I need hardly refer to the fact that the common floor with wood joists, floor boards and ceiling plastered is not a "sanitary" floor, but it will be some time yet before we can get a solid floor of any sort used in country houses even of the better class, so I need not go into the difficulties of any of the varieties, either as to cost or execution, but I may say with regard to partitions that I think the stud partition of "quartering" plastered both sides should be consigned to the past, porous and pumice bricks, breeze concrete, perforated and solid plaster slabs, and solid plaster on expanded metal are all so much superior that their use should be universal even in country houses. Building the tops of chimneys in cement and the insertion of proper damp courses in them should be a matter of common practice, but I fancy more attention is often paid to the problem how to get a chimney to draw, or not to smoke, without recourse to a chimney-pot, than to whether the damp course has been properly put in.

The architect who has been called in once to try and cure a bad case of "dry-rot" in a house will, I imagine, need no reminder as to the necessity of making provision against such a misfortune arising in one of his own buildings; or one who has lived during a cold winter in a country house with no

means of heating the hall or passages, he, I fancy, will bear in mind the necessity of heating arrangements the nature of which need not discuss. I would only say avoid any system which combines heating and a supply of hot water for domestic purposes, unless the former be of the most limited description.

Windows.

The height of rooms, the lighting of them by suitable windows, and, if no fireplaces are provided, some means for the air to escape—I shall not venture to use the word ventilate in connection with this, even the cistern-rooms should be well lighted, although the water is not the better of any light. The height of the windows with relation to the floor and ceiling requires attention, many of the building regulations having aims on the subject, and it is not a pleasant experience, when a picturesque window or, mayhap, several of them have been ranged in the roof, to receive a polite request from the authorities to alter, so as to conform to by-law so-and-so.

High bottom beads or rails to double-hung sashes as a simple inlet for air are not made use of as often as they could; they also form a very excellent stop to prevent wetting in at these points when heavy gales blow directly on windows, as is so often the case in exposed situations in the country.

A played notch on the outside of the bottom bead is an additional safeguard against water, but do not cut the notch side down, as illustrated in a well-known work on specifications—evidently a slip, but still liable to be copied by the beginner.

I think we may now turn to the matters which are more generally known as sanitary. It is really to impress upon you many sanitary items there are which require your personal attention, and which you cannot hand over as a C. amount to your pet sanitary engineer. He, poor man, if he is a little above the average, may tear his hair when he reads water-closets, baths, lavatories and sinks dotted about over the plan, causing him the greatest difficulty in dealing with the arrangements, if (and bear in mind I say "if") you have not given the matter the consideration it requires from the first.

We shall presume all things are in order and the water-closets are grouped fairly well in one part of the building, as in outlying ones as possible, baths not over rooms where the flow of water from a quick waste will disturb the occupants of the rooms below, also where, if leakages occur, as little damage as possible will be done.

All these things are in order, and we shall now consider the fittings and drains.

First of all, let me assure you that the more simple the fittings are the less future trouble your client will have, and that it is a matter of some importance in outlying country districts. I spend a short time every year at a house where, if a plumber is required, he has to be brought a distance of some miles—about 7 by rail and 10 by coach. This is enough to make one careful that the taps do not require washers or the water-closets new seatings more often than is absolutely necessary.

Taking the important item of water-closets, I should advise in all cases a wash-down or pedestal basin, and in saying this I now lay myself open to criticism, but I have been through the points of noise and flush and non-cleaning and comfort and habit and all the rest of it, and am still of the same opinion. As to the particular type I shall not say much. I think it should not be what is called "large area" water surer; I do not think the clearing of these is at all satisfactory, even with flushing cisterns of larger capacity than we are allowed to use in London as a rule.

I also think the basin you select should have the most simple joint to the soil-pipe that can be obtained, consistent with perfect water seal or air tightness, depending upon the position of the joint; in fact, I desire a perfect joint which any handy man can make, as the basin may be broken any day by careless use or accident. The back of course should be straight, and the flushing rim, if it is of that variety, should show a good body of water falling all round. Seats should be of hardwood in two thicknesses, preventing the warping and cracking which seats made of one thickness are liable to. The water-closet should be fixed so that the flushing cistern can be placed immediately over the inlet arm; in old-fashioned position, back to a window, is the worst for a water-closet worked with a W.W.P. or flushing cistern. The seat should either have rubber bosses fixed on the underside or iron runners projecting from the wall, leaving the floor clear for sweeping; the hinges should be brass pivots, and plates fixed to the edges of the seats at the side—not butt hinges, which are very usual. Every water-closet basin should be white; painted basins hide dirt.

One point in connection with the W.W.P., which does not deserve the attention it deserves, is the rate at which it fills. In specifications that it is to fill in a minute and a half, which means that with a low head of water a $\frac{3}{4}$ -inch ball valve

must be used, and as this costs a little more than a $\frac{3}{4}$ -inch ball valve, it is not always used when it should be. As far as my experience goes, a perfect flushing cistern has yet to be invented, so I shall not offer you any advice upon the sort to use, except the fewer the working parts the better. The shell, if of cast-iron, should always be galvanised; wood lined with lead are best in some situations, both on account of quality in the water, and not so liable to damage from freezing. I think a chain or, for the better qualities, a brass rod, not in a slide, the best form of pull; a stop cock on the water supply to each flushing cistern is an advantage when repairs are needed; the position of the arm for connecting the antisiphon pipe is of some importance, and the method of connecting the pipe to the arm when the latter is of any stoneware type is a difficulty sometimes not satisfactorily dealt with; therefore I am inclined towards a lead trap to which the antisiphon pipe can be wiped as the best way out of the difficulty. If a valve closet must be fixed, use a good one; cheap valve closets with flimsy parts and badly finished brasswork require repairs frequently, and seldom repay for the small saving in the first outlay. A lead tray should always be fixed under these water-closets in case of leakage from the valve, with a weeping-pipe to the outer air having a copper flap at the end to prevent wind blowing up the pipe, and the same applies to the overflows from all cisterns and flushing-tanks. Care should be taken to make the wood fittings in connection with these water-closets easily movable and clear of plasterwork and the like.

Baths.

I do not think I have any particular remarks to make as to baths. Whether porcelain, cast-iron or copper be used must always be a matter of individual taste; the first-named is always difficult to heat if a hot bath is required. Copper is the best in this respect, but a good one is always expensive and requires stout cradling to prevent it being put out of shape.

The bath fittings should, in my opinion, be of ample size, so that the bath can be filled rapidly, and I lean towards valves or taps which are quite distinct, the hot supply from the cold, and the nose projecting well over the edge of the bath if not actually inside (which is a modern improvement), very useful in case the valve leaks at the stuffing box or union. Lead safes are useful where the baths are enclosed, but the best type of baths do not require enclosures, and with these lead safes are unsightly, a tile or mosaic floor being preferable, or perhaps a sunk marble slab if funds will permit.

The wastes from baths, sinks and lavatories should be ample in size to permit of quick discharge, and the outlets should be of sufficient area to properly fill the waste-pipe. The latter should, in my opinion, discharge into an open head outside, so that the traps may not be syphoned out. I think this a better method than having long continuous wastes fitted with antisiphon pipes.

Lavatories and Sinks.

The number of lavatories and sinks from which we can select is so large that all tastes are catered for. Those having complicated fittings should always have lead safes under in case of leakage. Enclosures are to be avoided, as they become receptacles for dirt and objectionable things in general. Every fitting of this nature should have a proper overflow. I have had considerable trouble with sinks for hot water washing-up in cases where glazed ware was unsuitable, and have tried wood lined with lead, zinc and tinned copper, but they all proved practically useless in a very short time in cases where there was much washing-up to be done with hot water; 2-in. teak put together with red lead, galvanised bolts and brass screws being the only form of sink suitable for this class of work; in this case I have had the waste plugs made hollow and of sufficient height to form an overflow. Care should be taken to have a proper grating in the waste washer, which can be removed but not too easily taken out, otherwise it is never in its place and pipes get blocked up. Angle strainers in sinks are a useful addition in this respect, if the domestics can only be induced to make use of them.

The vexed question of housemaid's sinks should be considered; what its use should be and to what extent they should be provided. Except in large houses I consider that a water-closet should be used for emptying the slop-pails into, but when a slop sink is required it should resemble a water-closet, not have a grating or anything of that nature to the outlet; the latter are only suitable for fixing under hot or cold draw-off taps, which should be provided in the housemaid's closet; the latter should be light and airy, not, as so many are, in some corner, deficient in everything except dirt and smell. If a real slop-sink is provided it must be fitted with a ventilated soil-pipe and antisiphon-pipe, exactly as a water-closet would.

All sinks should have high backs or some other means of preventing the wall or enclosure from getting wet; slabs of

marble, tiles, rendering with Portland cement, all answer the same purpose. No space for water to trickle down should be left behind sinks of any description.

Traps.

Usually of drawn lead, should be fixed under all fittings, with brass cleaning screw, the latter having a square or oblong projection for unscrewing, not a couple of small holes or an indentation requiring a special tool to unscrew it. A little time ago I spent an hour with a plumber getting out a screw tap to a sink waste; if it had had a projection to fit a spanner it could have been removed in one minute.

With regard to fittings generally, there seems to be a great laxity amongst men who do this class of work—both those who specify and those who execute—as to connections between fittings and lead pipes; these should always be made with “unions and flynuts;” as a rule the “union” portion is omitted, say, for instance, connecting a stop-cock; more often than not both ends are simply “tinned” and the joints wiped, so that to get the cock off for repairs the pipe must be cut in two places and two new joints made when it is refixed. If proper unions were fitted in the first instance they could be unscrewed, screwed up again without damage to pipes or fittings or a useless expenditure of time. I shall only direct your attention to one other point in connection with fittings, the word “self-cleansing” now in such common use. It would be well if all architects and, indeed, their clients also, would understand that this term does not mean that the particular fitting will keep itself clean, but that there are no corners or angles or the like where dirt can accumulate. Baths, lavatories, sinks and water-closets particularly require “elbow-grease.” The daily application of a closet-brush to water-closets would prevent such filthy traps as are on exhibition in too many houses of even the better class.

The supply of water to any house, country or otherwise, is a matter which should receive careful attention, but more particularly in the country. Very often the difficulties are increased by the supply being limited from various causes, such, for instance, as want of power to pump the water up to the required level. This is too large a matter to deal with to-night, beyond saying that the Canadian type of windmill, hot air and petroleum engines all serve the purpose when natural gravitation is not available.

Pipes for water service should be considered with regard to the nature of the water, particularly in some localities where both the water and the earth may cause deterioration of lead, the water thereby being contaminated occasionally. I show you a piece of lead pipe taken from a house near Bedford some time ago, the exterior eaten away by some action of the earth in which it was laid; some hundreds of yards had to be renewed in this case. I laid some lead pipes in the neighbourhood in trenches which were filled with sand and gravel, with which the pipes were surrounded to prevent damage from the above cause. Lead lined with tin, or iron lined with glass are very good, but are expensive, and the former require special joints. The storage of water is, of course, a debated point. Personally I am for storage, as I consider it can be carried out with very little fear of contamination, and it saves many a trouble when there is a hitch in the supply. In a country house a supply of water for drinking and cooking purposes can be stored in a glazed stoneware tank (if a slate or galvanised iron one is not considered good enough), either white or buff, which, with occasional cleaning, is about the most sanitary article which can be obtained. The general supply can be stored in a galvanised wrought-iron cistern, or cast-iron or steel plate. If the size is large the wrought-iron should never be less than one-eighth inch in thickness; many are so thin as to be useless in a very short time. I have found it an advantage when a galvanised cistern is used to have it thoroughly cleaned out when all the connections are made, and then to paint the inside twice with Portland cement, mixed with water to about the consistency of paint; this preserves the galvanising, and covers many of the little projections left in the process.

I need hardly remind you that close-fitting covers to the cisterns are essential; that the cisterns should, if possible, not be placed where the water is liable to freeze in cold weather. Near a chimney is a good position, other matters being equal. Ease of access should be considered for cleaning out, and safes under are always advisable in case of accidental overflow. The position of outlets deserves attention. They should always be in the side of the cisterns, so that dirt cannot get down the pipes, and if a supply is taken off for hot water it should always be taken out of the cistern below the general cold-water supply, otherwise there is a danger of leaving the hot-water system without water in times of scarcity. Stop-cocks, with unions and large wheel-heads, so as to be easily turned, are necessary. Wrapping the pipe with slag wool made upon canvas is desirable, and where casings are fixed they should be easily removable, not nominally so, as is so frequent. One further point with regard to cisterns. There are some on the market which are intended for use as a reserve

only, the supply under ordinary circumstances coming direct from the service-pipe and not passing through the cistern. I am not in favour of this arrangement, as the water might be in the reserve for so long a period that its use might be undesirable. I think we may now turn to the soil pipes and drains, dealing with the former first. Naturally lead is the most suitable material, except in cases where large quantities of hot water alternating with cold have to be dealt with; under these circumstances cast-iron is more desirable, as the lead is buckle and at times cracked by the alternate heating and cooling. The connection of the foot of the soil pipe to the drain is often not carried out as it should be; if the soil pipe be $3\frac{1}{2}$ inches in diameter and there is no necessity for it being larger, the brass tail-pieces usually sold have such a narrow flange that it will not bear on the collar of the pipe, but slips right down; a wide flange bearing all round on the stoneware socket should be specified and insisted upon. The tailpiece should be lined with the lead pipe the whole length, the latter dressed over the flange all round and the joint wiped round the top edge; the whole length of the tailpiece should show above the ground-level and the joint to the drain be made with cement well flounced and trowelled hard.

A sufficient number of tacks should be put to lead soil-pipes not less than every 5 feet, in pairs on both sides; bends should, of course, be avoided where possible; the soil-pipes should be carried up to a sufficient height to insure the gases coming from them being taken away clear of windows and ventilators, but not up the side of chimneys finishing close to the chimney-pots, in which case there is a great probability that as the air from the drain comes up the ventilating-pipe it will go down the smoke-flue, in many of which there is a down-draught except during the time there is a fire actually in the stove. Guards of some sort should be fixed on the tops of soil-pipes to prevent birds building, leaves, &c., getting in. Branches into soil-pipes should be arranged so as to avoid joints being in the thickness of walls, and the connections of water-closets to the branch pieces should be carefully attended to. So much has been written about drains and drain-pipes that I fear you will be weary of the subject. As a rule the drains are a simple matter if one only could get perfect joints, and it is to improve these that so much attention is directed at the present time. Certain points should always have careful attention; for instance, where there are separate soil and rain-water drains the former should always be laid below the latter. If the rain water be stored for use, the joints of the pipes conveying it should be most carefully made, as it is possible for water to get into the pipes from the surrounding earth as well as to get out, and the quality of that getting in may be very objectionable. One of the chief difficulties in laying drain-pipes is to get a true alignment at the joints, so that each pipe may be quite concentric with those adjoining. With the ordinary joint this is a matter entirely depending on the skill of the individual who lays and joins the pipes. The cement exuding when the pipes are pushed up together is another difficulty, careful wiping out of the pipes at each joint being the only remedy for this most frequent defect. To obviate these difficulties some use gaske or hemp bound round the end of the spigot, to make the end of the pipe fit close and concentric; but I think the pipes with a ring of composition on the spigots and sockets, and a cement joint outside is the best method for avoiding difficulties of this nature and taking a great responsibility off the man who actually lays the pipes. The concrete on which the drains are laid is a matter on which much difference of opinion exists. One of the latest text-books advises a bed of concrete about 6 inches thick, laid to a regular fall, on which the pipes are to be laid, the space under the body of the pipe then being packed up with concrete. I do not consider this a good plan. I suggest that a bed of concrete 6 inches or 8 inches thick be laid with indentations at regular intervals for the collars of the pipes, allowing room enough to make the joint. The whole length of the pipe bearing on the concrete renders the length much less easily knocked out of position by accident. When each length is completed a benching at the side, up to about the middle of the pipe, is sufficient. Except to resist external damage, there is no object to be gained in surrounding pipe entirely with the ordinary concrete, which is of too porous nature to keep in any sewer-gas or air which may escape from defective pipes or joints. Of course if a pipe surrounded with concrete, say 18 inches or 20 inches square, is to be looked upon as a beam, then it is superior to a pipe with benching up to its middle only, but I think we should always try and get a sufficiently good foundation for the drains to enable us to abandon the beam theory. It is, of course, necessary to protect pipes from shocks of heavy vehicles passing over them in such like. The concrete should be properly made with clean material, and where the earth falls in upon it when the pipes are being laid, it, viz. the earth, should be carefully cleaned off the surface before the additional layer of concrete is put down, otherwise there will be two distinct layers, one not connected with the other.

I need not trouble you with any remarks as to the size

ins, their inclination, whether they should be stoneware or iron; these are more matters of office routine, which can be decided to suit the circumstances of each particular case. We turn to the construction of manholes or inspection chambers, a few remarks are necessary. If built of bricks, renderings are not necessary to the walls; in ordinary earth a concrete extending to the external face of the wall is sufficient. I prefer rendering the interior with Portland cement to the white glazed brick; the joints in the latter away any benefit gained by the glazed surface of the brick. Some say that hot water damages the rendering, but as water does not often rise above the benching, I have not noticed the damage occur. The benching should be steeper than is usual and of a convex section, so that the solids washed down the inclined surface may slide into the central channel. No objection as to this form being convenient to stand upon, so long as it need not be considered. Manhole covers should always be galvanised; it is quite worth the extra cost. In the country, where every manhole would be out of doors and close to the house, the airtight quality of a cover is not of much importance as it is in towns. Turning to what is usually called the "air inlet," I think that, unless it is placed in an unfrequented position, it should always be carried at least 8 feet high, without any mica flap or valve of any sort; these are a delusion, they get out of order so easily, and their use as at present in towns will not continue very long. It is an accepted fact that there is an up current in most ventilated soil-pipes under ordinary circumstances, where a water-closet on the soil-pipe is used, it reverses the current for the time and drives the air out at the first available outlet, which is usually the so-called "inlet." For this reason, particularly in towns, the inlet should be carried above all windows and the like, but in the country a pipe the same diameter as the drain taken up say 8 feet with a bend and wire guard at the top to prevent leaves and so on getting in is quite sufficient, perhaps more than sufficient some will say and advocate a grating, say 18 inches square, close to the ground level. I need hardly remind you that overflows from water tanks should not, under any circumstances, be connected to soil drains, nor do I think surface water drains should, even with traps fixed on the outlet, unless some length of open channel intervene between the trap on the surface water drain and the connection to the soil drain.

Sewage Disposal.

In many districts the disposal of the sewage of a country is a great difficulty where there are no sewers in the neighbourhood and the pollution of streams is very properly objected to. In such cases it is perhaps desirable to consider the advisability of having a separate system of drains to take away wastes from baths, lavatories and fittings which do not contain solid filth with a tank, the contents of which can be used for watering gardens and the like; this would greatly reduce the amount of liquid to be dealt with. The sewage, or excremental filth portion, can then be dealt with by some of the methods of bacterial treatment, known by the various names of septic filters, septic tanks and such like. From what I have read on the subject, it seems to me that the treatment should be a form in which the sewage is passed first through a settling tank, and then through filters exposed to the light. It will not permit me to go into the various methods advocated. I would remark that I heard of the arrangement known as the bacterial tank from a member of the Architectural Association a good many years ago as Moura's Automatic Scavenger, a description of which can be seen in the Proceedings Institute of Civil Engineers, Vol. 68, page 359, 1881-82; vol. 72, page 359, 1882-83; vol. 73, page 502, 1884. From these notes I had a scavenger constructed in the latter part of 1893 at a private house I was then building, in the hope that it would render the sewage less offensive. This it has done most effectually, and though I cannot claim for it that the effluent is by any means perfect, it is not offensive. The tank has never been touched since the last eight years, and the last time I examined the contents they were quite clear and no solid matter had passed out of the chamber, showing that the solids had been broken down as anticipated. Since then I have advocated its use at lectures on sanitation, and I know other tanks have been built from the advice I gave, so that no patent rights can be claimed for this portion of the arrangements which are now before the public. It has always seemed that some precautions should be taken against freezing in an installation of this kind. I have heard of one "Automatic Scavenger" (Moura's) for the liquefying tank) being frozen up; it would be inconvenient indeed if such should be the fate of some of the tanks by our members; this is one of the points to be kept in mind.

I do not suppose any paper on the sanitation of a country would be complete without some remarks on the dry earth-closet. A properly situated and arranged earth-closet is a sanitary adjunct to a country house, no matter what class

it may be intended for. Everything good in this world requires attention, and because the earth-closet requires, perhaps, a little more attention than people care to bestow upon it, it has got into bad repute. I speak now of outdoor—and shall we say isolated?—earth-closets. If each country house was provided with an earth-closet constructed on the lines advocated by Dr. Poore in his books "Rural Hygiene" and "The Dwelling House," I imagine some of the difficulties of sanitation would be got over, and some of the dangers from the want of it would never arise. I refer, of course, to the "dry catch" system, the principle of which is that the floor on which the excreta falls slopes towards the outside, allowing the urine to run into a receptacle filled with mould and so the excreta is left dry, in which state objectionable gases are not generated. The usefulness of this arrangement depends, of course, upon regular attention—I do not say daily attention, as I intended to do at first, but regular. The difficulty is in getting people who will go just a little out of their usual course to obtain what will, no doubt, have beneficial results, the latter being to the people concerned not quite apparent. I can only commend to your attention the books of Dr. Poore, as you ought to know something of this method even if your clients cannot be brought to adopt the system advocated. I also suggest for your perusal an article in *Country Life* in the number July 6, 1901, called "An Experiment in Sanitation," written by Dr. Poore, which deals in a most admirable manner with the storage of rain-water and the disposal of slop-water and excreta, suitable for cottages.

Now, gentlemen, I have concluded, not because I have exhausted the subject, but because I was particularly asked not to make the paper too long, and also for the very good reason that I wish to leave time for a discussion, during which I hope that I amongst others may obtain some valuable information. I have tried to bring before you some points which are usually admitted as essential to the sanitation of a country, or, indeed, any house, but which I find require a great amount of supervision to insure their being done properly, and as the very essence of sanitation is thoroughness in every small detail, I commend it to your most careful consideration, with the final remark that one of our objects should be to try and obtain "the most perfect action of body and mind during as long a period as is consistent with the laws of life; in other words, to render growth more perfect, decay less rapid, life more vigorous, death more remote."

Mr. T. BLASHILL, in proposing a vote of thanks for the paper, said the subject had been so fully treated that it would remain a useful guide for those connected with building. The putting in of drains had not always in the past received the attention and care that was necessary for health. Workmen, however, were getting better because architects and builders began to realise the importance of skill and supervision in the work; the sanitary authorities tested the drains and thus prevented scamping. In the treatment of basement or lower floors there were certain difficulties stated in the paper. It was a mistake to put wood down where there was space below the floor; dry rot usually occurred, to prevent which it was necessary that the boards should be treated with three or four solutions. If dry rot was noticed in time the wood might be saved by scraping the fungus off and then painting the boards with the solution.

Mr. P. GORDON SMITH seconded the vote. He said they all knew the intricacies of Portland cement, and for this reason it seemed unwise to rely upon stoneware drain pipes. Heavy cast-iron pipes were a good substitute because they had so many advantages, more particularly in the length, which meant a lesser number of joints. The speaker said that a system of drainage by cesspools was wrong and should never be allowed.

Messrs. E. O. SACHS, W. E. HEWITT, F. HOOPER and E. GREENOP supported the vote.

The Vice-President, in putting the vote, said the whole paper and the discussion showed them that the architect in the matter of drainage should not be at all dependent on others. One error in the system of drainage for a house might spoil the purpose of the whole structure and make it unfit for use.

AN AMERICAN OFFICE BUILDING IN LONDON.

AN influential English-American syndicate has been formed, says the *Times*, for the purpose of erecting in the heart of London an office building on American lines, which it is asserted will cost 2,000,000*l.*, and will be the largest and handsomest structure of the kind in the world. The syndicate submitted this week to the London County Council a written application for a 999 years lease of the site, which, it is understood, is on the north side of the Strand between the two points at which the new street from Holborn will debouch on the Strand. The application is signed by the following gentlemen:—Sir Richard Farrant, Earl Grey, Sir C. Rivers Wilson, the Earl of Kintore, Messrs. Frederic B. Esler, New York;

George Cornwallis West, Charles S. Drummond, J. Oakley Maund and G. Sheriff Hilton. Mr. Esler is understood to represent large American interests.

The site of the proposed building has a frontage to the Strand of 750 feet, with even longer frontages to the adjoining new streets which are being opened. It has an area of 125,000 square feet. The architect's drawings, which accompany the application, show that the entire building will be seven storeys in height, but a portion will have three more storeys, the whole of steel construction with sandstone exterior. It will be equipped with every modern convenience. One of its special features will be a spacious rotunda under a lofty dome in the centre of the building, intended to form a general rendezvous. The basement will consist of extensive safety deposit vaults, a large restaurant, engines, boilers and machinery for furnishing heat and electric light, and the power necessary for running thirty lifts. The ground-floor will contain special accommodation for banks and insurance companies requiring large rooms and for shops. The upper floors will be given up to offices. It is estimated that the actual floor space available for letting purposes will amount to 900,000 square feet, and that there will be more than 6,000 rooms in the building. The rents payable by the tenants will include charges for heating and electric-lighting, cleaning and telephone service. Every office, or suite of offices, will contain a telephone, and the landlords will contract with the telephone company for a sufficient number of trunk lines to meet all requirements. The lift service will be in operation all night, and the building will be accessible day and night throughout the year. It is estimated that the annual maintenance charges will be upwards of 35,000*l.*, and that the construction will probably take two and a half years. The syndicate was anxious to obtain the freehold of the site, but was informed that the County Council would only grant a lease for 999 years.

THE CAVE PAINTINGS OF COMBARELLES.

IN the caves that honeycomb the limestone walls of the gorges through which flow the tributaries of the Dordogne there dwell, says the *Manchester Guardian*, no one knows how many æons back, the fellow-tribesmen of Rudyard Kipling's Palæolithic artist Ung. The glacial ice-cap that had once overspread the country was shrinking, and the deep snows had melted, but the climate was still semi-arctic, and even the hardy hunters of that day felt the need of shelter. They drove out the cave-bear and the hyæna and took their dens for homes; there they chipped their axe-like weapons of flint, and sharpened for themselves daggers from the bones of their prey. And sometimes in an idle hour they carved the handle of a dagger into the likeness of a deer, or scratched upon a blade-bone the outlines of an aurochs or a horse. French anthropologists have long been busy digging into the floors of these cave-dwellings, turning up the cold cinders of prehistoric hearths, and sorting out the piercers and bone needles with which Palæolithic woman sewed the fur garments of her lord; but quite recently MM. Capitan and Breuil have made a discovery which proves that some of these rude primitive hunters could not only etch and carve, but had made considerable advance as painters also. About two miles from the well-known station of Les Eyzies, in the valley of the Beune, at a place called Combarelles, these energetic members of the Paris School of Anthropology found and explored a cave which runs back into the hard limestone cliff for more than a furlong. In places the cave is only 18 inches high, and the explorers had to crawl in flat on their faces, but further in it rises to a height of 10 feet, with a width of 4 to 6; and here, at a distance of 130 yards from the entrance, they were rewarded by entering a veritable picture gallery; in fact, as Rudyard Kipling might put it, they chanced on the workshop of Ung. The primitive artist had covered either wall of the cavern for a length of over 100 yards with a highly spirited series of drawings of the wild beasts upon whose flesh he and his fellows lived.

Glory and honour to Ung!

Later he pictured an aurochs; later he pictured a bear;
Pictured the sabre-tooth tiger dragging a man to his lair;
Pictured the mountainous mammoth, hairy, abhorrent, alone.

Here in the cave of Combarelles are not one but several pictures of the mammoth, obviously drawn from the life; we see him there with his high, upright forehead, curiously hollowed out in the centre, with his strongly curved tusks, his shaggy coat, his elephantine feet, and his long trunk, sometimes hanging peacefully down, sometimes curled back in anger above his head as he charges headlong on his enemy. Then there are horses, numbers of them; all, however, of the hammer-headed type known to us already from the etchings on bone; but one of Ung's horses has on his back what looks like a housing, with a triangle pattern on it. We knew before

that Palæolithic man hunted the wild horse for food; but can it be that he had also tamed him and taught him to bear a burden? It would almost seem so.

Quite distinct from the horse, Ung has drawn for us a second animal which clearly belongs to the genus *equus*. It has a mule-like head and a stiff, upright mane; the upper part of the neck is very high and the tail is set on very low down. No such animal exists now in Europe, though the fossil Helladotherium of Greece may have resembled it, and within this last year nothing like it was known elsewhere; recently Sir Harry Johnston has discovered in the Semli forest of Central Africa a strange new mammal forming a link between the giraffe and the horse, to which he has given its native name of the Okapi. Possibly Ung has preserved for us the likeness of a European cousin of the Okapis. He has sketched other beasts, too, that few of us are likely to see anywhere except in the Zoo: His skilful hand traced the uniquely palmate antlers of the reindeer, the huge shaggy head of the aurochs, the curled frontlet of the wild bull, the beautiful head of the Saiga antelope, and the graceful backward sweep of the horns of the ibex. Many of these animals are done as separate figures, while others are so thickly crowded together that it is impossible to disentangle one from another, especially as most of them are covered with a quarter or half an inch of semi-opaque stalagmite. The outlines have been cut into the limestone rock with a sharp tool, probably a flint, and in some cases a black pigment has been neatly laid in the groove, so as to make the definition perfect. One thing alone is lacking. Ung declined to be a portrait painter, and with only a single exception, and that of doubtful attribution, the human form is absent from the walls.

But either Ung had a rival who was determined to excel him or else he himself was ambitious and, when he had finished his work at Combarelles, resolved to become a colourist. A Font de Gaume, a mile from Combarelles, a steep cliff rises from the floor of the valley of the Beune, and in the face of it 70 feet from the ground, MM. Capitan and Breuil found the entrance of a second cave. They crawled and squeezed through some very narrow passages, but after they had worked their way in for about 70 yards the sides suddenly opened out and they found stretches where the cave was 10 feet wide and 20 high, and here the walls were literally covered with pictures. Ung (if it was he) must have felt that here he had free scope, and he worked with a larger brush. Some of the animals are almost life-size. There is an aurochs 8 feet long and 4 feet high, and a reindeer above 5 feet. And the artist used colour here with great effect. The outline is done with a mere scratch, but it is emphasised by a line of black paint a quarter of an inch wide, while the big reindeer is painted black all over, giving an effect like that of a figure in monochrome on a Greek vase. Other animals are outlined in black and then a broad tint of red ochre is laid over the whole figure. Others, again, were done with an underlayer of black and then red ochre laid on over it, giving a warm brown tint. This is the tint used for the head of the big aurochs and for other aurochs' heads, some of which are shown in profile and some full face. Other animals, again, have the head painted black and the body brown. In fact the artist may be said to have worked in fresco. Sometimes he scratched his lines on the rock and laid the paint over them; sometimes he laid on the paint first and then cut in lines where he wanted. Nay, he even utilised the natural bosses and hollows of the rock to accentuate certain desired features, and there are cases where after completing his subject he scraped away the rock all around it, leaving the figure of the animal in bold relief. The artist of Font de Gaume was a man of resource. But here, as at Combarelles, he drew no human forms. Did some scruple of a primitive religion forbid it? These wall-paintings of the Dordogne caverns arouse more curiosity than they satisfy. Why did the creator of these works set them in the recesses of a dark cave where no ray of daylight could show their beauty? Was he content that they should only be seen by the smoky glare of torches? Or was this too due to religious scruple, and were these caves the mysterious Halls of Holies of some primæval cult? We shall never know.

THE LIVERPOOL CATHEDRAL.

AT a meeting of the Childwall Rural Deanery, held in the Church House, Liverpool, Mr. Robert Gladstone explained the movement for the erection of a cathedral in Liverpool, a scheme which was now within measurable distance of realisation. When the subject was before the public in 1884 the late Bishop Ryle had told him that he would rather see twenty new churches in the diocese than a cathedral. The circumstances had changed; there was a new bishop, and a proposal for a cathedral had again come to the front, and it had been received with quite as much favour as could be expected. The total amount of money available for the work at present

s 150,000/, and he thought that with that they could be able to make a very fair commencement. When the former scheme was being discussed the site was upon was St. John's Churchyard, but it did not commend itself to the people of the town or to the architects. As the plans made in 1884 were drawn with the view of harmonising the building to the Classical style of George's Hall, they could not be used now, as a different site had been selected. The cost of the Monument Place site would be a quarter of a million of money, and to spend so much on the site alone was out of the question, even if it had the disadvantages of being surrounded by mean, poor property, among which were a number of public-houses. The committee having given to the matter the best consideration they were capable of, decided to fix upon St. James's Mount. Some people had found fault with that site on the ground that it was not central enough; but he thought if the wide and populous area between Garston and Bootle were taken into account, it would be found to be not far from the centre. Some other faults were put forward which, in his opinion, were so trivial that he had tried to find "a causa causans" underneath those trivial objections, and he thought he found in the question of orientation. A north and south position was what was contemplated for the cathedral, and he admitted that there was no ecclesiastical or religious reason for any other reason but a sentimental one why that should not be done. Those who had been in Rome could have seen Christian churches built in all positions. Therefore the question of orientation should not be allowed to stand in the way of the site at St. James's Mount. With regard to the utility of the site and its suitability for a magnificent edifice, he said without fear of contradiction that it would be difficult to find its superior in the whole of this country. Then there was another disputed point—the style of architecture to be adopted. The committee came to the unanimous opinion that it ought to be Gothic. Well, they had since then contented to allow the question of style to remain an open one, but if the architects of England could create a new style and show some beautiful plans, the committee would be very pleased. He had studied architecture for forty years, and he believed it would be impossible to find anywhere within the area such beautiful ecclesiastical buildings as those which were to be found in England. There were a great number of fine models in this country, and he hoped the architects would be busy in submitting to the committee a design that would be worthy of the great diocese of Liverpool. He was sorry to hear that the committee had been charged with being narrow-minded and shortsighted in this matter, and that they were going to produce a mean and shabby building. What they contemplated was a building 400 feet in length by 200 feet across the transepts, and 100 feet from the floor to the roof, which, when finished, would cost half a million of money. If it was a mean and shabby building, he did not know what meaning of language was. There was another objection, which he called a trivial objection. They were told that they were going to interfere with the public garden by one set of people, and by another they were told that they were going to interfere with the graves in the cemetery. At the present moment the committee did not contemplate using a single foot of public garden or interfering with a single grave. What was done by-and-by he did not know. These were the facts, and he hoped the Childwall Rural Deanery and other bodies in the diocese would do their best to help on the work. Mr. Hampson said that in order to get on with so great a task as that of the cathedral people should sink their own views in deference to those of skilled and experienced people. They were promoting a Bill in Parliament to obtain powers to purchase the site, and also to purchase the advowson of Liverpool, in respect of which latter negotiations were going on between the committee and the trustees. The Rural Dean said the object of the meeting was to devise a system of raising funds in every parish for the cathedral scheme. A committee and organising secretary were appointed.

STONEHENGE.

THE following communication has been addressed by some archaeologists and societies to the Wiltshire County Council on the subject of the recent erection of a barbed wire fence around Stonehenge, and the resulting interference with the ways which have hitherto given the public free access to the monument:—
We think it our duty to call your attention to what has recently been effected in the case of Stonehenge. As the Council is doubtless aware, the owner of the site, acting, it is alleged, with the advice of certain learned societies and the object of raising funds to provide for the cost of preserving the monument and of maintaining a caretaker in the place, has erected a substantial barbed wire fence round

Stonehenge and a considerable extent of the open down to the south of the monument, and levies a charge of 1s. a head for permission to enter the enclosure thus formed to view the monument.

While admitting the necessity of safeguarding the monument in the future, and while appreciating the motives which have actuated Sir Edmund Antrobus, we desire to point out the grave legal and other objections to the course which has been adopted to provide funds for the purpose.

Stonehenge has been freely open to the public from time immemorial. It was doubtless originally a public place either of worship or of sepulture, and it must be purely accidental that it has come into private hands. However this may be, the fact that the outer earthwork of the monument has been cut through to a depth of two or three feet in more than one place by carriage-ways, proves the great length of time during which the public have openly and largely resorted to Stonehenge.

The recently-erected fence runs across the carriage-ways to which we have alluded and obstructs all passage by them. It appears to us that this obstruction is illegal. We are advised that the ways in question are public ways, and if so, it is beyond doubt that they cannot be stopped except by an order of quarter sessions.

There can be no doubt that the law fully recognises that a right of way can be acquired by the public to a monument or place of interest and beauty irrespective of the ownership of such monument or place, or of whether the way is a continuous one or stops at the point of interest. This was lately recognised by the Court of Appeal in the case of the Giant's Causeway in Ireland. The Lord Chancellor of Ireland, in that case, specially referred to Stonehenge by way of illustration:—

"Could anything," he said, "be more absurd than to suggest that an owner could not dedicate a public way to allow the public to see some points of view of world-wide fame on his property which could be readily seen from or at the end of the road? Would it not be strange if the owner of Snowdon could not dedicate a way to the summit, or if the owner of Stonehenge could not do the same to that great national monument; or if the owner of our neighbouring Sugar Loaf or Dargle were precluded by some vagary of the law from dedicating a road to permit their countrymen for all time to view these lovely spots in our island? I am thankful to say I do not believe it to be the law."

There seems to be no doubt whatever that there are two ways at least leading up to the very edge of the circle of stones of Stonehenge to which the right of the public is clear, and which must be deemed to have been dedicated to their use in very early times by the owner of the land and stones, and which have been obstructed by the fence as now erected.

The assertion of the public right to these footways would incidentally restore access by the public to the monument, and render impracticable the charge of 1s. per head to visitors, a charge which, in our opinion, ought not to be tolerated in respect of a monument which has from time immemorial been open to the public. Apart from the question of the public right of way, we see no reason why access to the monument should be restricted to those who can afford to pay 1s., and refused to the far greater number who cannot afford to pay this sum.

We think, therefore, we are justified in appealing to the District Council and the County Council to vindicate the rights of the public in respect of these footways and the access which they give to a monument of such unique interest.

We earnestly deprecate the enclosure both as illegal in respect of the obstruction of public ways, and as detrimental to the interests of the public.

It has been said that the enclosure is necessary for the protection of Stonehenge, and further that works of restoration are urgently needed, and that the payment for admission will supply the funds required for these works. We believe that for the purpose of protection caretaking is all that is desirable; indeed, some caretaking is admitted to be necessary in any case; while the expenses of maintenance and such restoration as is desirable, we are certain, would readily be supplied out of public funds as contemplated by the Ancient Monuments Acts, if the public were assured that they were undertaken in the public interest.

Stonehenge is a national monument of rare, and, in a sense, of unique interest. It is, we believe, the grandest and best preserved specimen, not only in the British Isles but in Western Europe, of those stone circles which seem to have played an important part in the life of a widely spread branch of the human race in remote ages. In its day it must have been a public place of great importance. Nothing should be done which interferes with the national interest in such a monument. We need not point out that the erection of a fence round it and a charge for admission seriously and prejudicially affect such interest. The Ancient Monuments Acts have indicated ways in which Stonehenge may be placed in public guardianship. If the national interests in Stonehenge were permanently assured the question of its physical protection would assume

a different aspect. We understand that the County Council was willing to undertake the protection of the monument under the recent Act.

We also desire to point out that the fence as erected is not in accord with the scheme contemplated by the representatives of the learned societies at a meeting on the spot. It was then proposed, we are informed, that the fence should be at a much greater distance from the circle of stones than is now the case. This would have necessitated the diversion of a public highway, and the meeting appears to have separated under the belief that nothing would be done until the necessary public consents had been obtained for the diversion of the highway. The application for the diversion of the roadway would have called public attention to the whole subject, and have given opportunities for objection. It would then have been pointed out that the other ways referred to in this letter would also be obstructed.

It is a mistake, therefore, to suppose that the fence, as now erected, has been agreed to by the representatives of these learned societies. It will, we think, be universally admitted that the fence is much too close to the stones, and is painfully prominent in any view of the circle. It is, in fact, an eyesore, and the character of the monument in relation to the surrounding country is completely altered.

Under all the circumstances of this case we trust that the local authorities of the district will take action to assert the public rights over the ways to the monument across which the enclosing fence has been erected, and will further take whatever steps may be necessary for the protection of this unique monument.

It is signed by representatives of the Commons and Footpaths Preservation Society, the National Trust for Places of Historic Interest or Natural Beauty, the Kyrle Society, Professors Flinders Petrie, Sir W. Martin Conway, Percy Gardner and Ernest Arthur Gardner.

GENERAL.

The Winter Exhibition of the Royal Academy, which will open on the first Monday in January, will consist of works of the old masters of various foreign schools, principally Italian and Dutch.

The Princess of Wales, accompanied by Prince Francis of Teck, visited the exhibition of portrait painters at the New Gallery last Friday.

An Exhibition of Scottish art, past and present, is now being arranged at the Whitechapel Art Gallery, and will be opened on December 12. Six or seven fine portraits by Raeburn have been already promised. Pictures by Sir George Harvey, Sir David Wilkie, Phillip, Dyce and Pettie, and many other works by Scottish Royal Academicians, as well as by Royal Scottish Academicians, will be included in the collection. Further loans, however, and contributions towards the necessarily heavy expenses will be welcomed by the director and committee.

The Right Hon. Sir Richard Henn Collins, Master of the Rolls, has been appointed by the King to be Chairman of the Historical Manuscripts Commission, in the room of the Right Hon. Sir Archibald Levin Smith, deceased.

The Pitt Rivers Museum has lately received an interesting and important addition, the gift of Professor Tylor, consisting of a totem post, brought from Masset, a village in the north of Queen Charlotte's Island. These totems are becoming extremely rare, for the Indians are discouraged by the missionaries from their production. Professor Tylor's totem was obtained with some difficulty through the obliging agency of the Hudson's Bay Company. It consists of a cedar wood trunk, some 40 feet in height, boldly sculptured in several groups of figures one above the other. These represent the bear and raven totems, which are said to belong to the same group. The totem post is flanked by two house posts from the same village, one of which is a representation of the "killer-whale," a head at either extremity, the centre filled by a figure of the demon-tenant of the whale.

Sir John Aird, M.P., has left London for Egypt, where he has to meet the Khedive and inspect the works in progress at Assuan and Assiut.

An Exhibition of portraits of kings and queens of Great Britain and Ireland will shortly be opened at the New Gallery. It is hoped that portraits from the time of Henry VII. will be lent. Mr. Leonard C. Lindsey, F.S.A., is acting as secretary to the exhibition, which will have for title the Monarchs of England.

The Woodbridge Urban District Council (Suffolk), with a view to prevent street accidents at dangerous corners, have, on the recommendation of the surveyor, erected mirrors which enable drivers approaching a corner to see vehicles approaching from other directions.

The Chinese Government, it is said, has paid 500,000 roubles for the restoration of the Russian Legation church at Peking which was destroyed during the disturbances of last year, and also agreed to permit a large orthodox monastery to be built in Peking.

Mr. Arthur John Evans, keeper of the Ashmolean Museum at Oxford, has been elected corresponding member of the Munich Academy of Sciences.

A Fund is being organised to collect a sum of 1,600*l.* to erect a spire, in accordance with the original design, on the church of SS. Philip and James, Cheltenham, in memory of the late Canon Hutchinson.

The City Corporation intend to apply to Parliament for further powers which would give them greater control over the public thoroughfares of London, especially in the matter of the tearing up of the streets.

An Underground Railway is authorised to be constructed in Paris from the Palais Royal Square to the Place du Danube, at the north-eastern extremity of Paris. It will pass under the Avenue de l'Opéra, the Rue Lafayette and the Buttes Chaumont. The line will be four miles in length, and is estimated to cost 18,500,000 francs.

Belfast Merchants and others interested are giving subscriptions to defray the expenses which will be incurred in promoting a Bill under the Scotch private bill procedure in connection with the project of Mr. James Barton, C.E., for a tunnel between the coast of Galloway and Islandmagee, county Antrim.

The Collection of pictures by Mr. E. A. Abbey, R.A., representing "The Quest of the Holy Grail," which have been on exhibition at the Guildhall Art Gallery, was closed last Tuesday. The pictures will be removed to America, where they are to adorn the walls of the new public library at Boston.

The Tender of Messrs. Collings & Godfrey, of Tewkesbury and Cheltenham, has been accepted for the erection of a town hall at Cheltenham. The contract is for 29,310*l.*, and will be completed within twenty months.

A Meeting of the Royal Society of Antiquaries of Ireland will be held in Dublin on Tuesday next, when the following papers, "Slane in Bregia, co. Meath; a Study of its Franciscan Convent and Hermitage," by Thomas J. Westropp, M.A., and "The Cross of Blackrock, co. Dublin," by Patrick J. O'Reilly will be read.

The British Association of Waterworks Engineers will hold its winter meeting at the Geological Society's rooms, Burlington House, W. (by kind permission of the President and Council of that body), on Saturday, December 7, when the chair will be taken at 10.30 A.M.

Acetylene Gas is now adopted for the illumination of the smaller French towns. Among the latest instances are Senonches, Cloyes and Voves.

Mr. E. T. Batsford is preparing for publication a work on "Formal Gardens in England and Scotland," by Mr. H. Inigo Triggs. It will be completed in three parts at 21*s.* each, of which the first will appear on December 13. The specimen plates suggest the beauty and professional interest of the work.

Mr. T. Worthington, the assessor, has awarded the three premiums for the best designs in the recent competition for a new fire station and police station in Manchester as follows: namely, first premium, 300*l.*, to design No. 23, Messrs. Woodhouse & Willoughby, 100 King Street, Manchester; Mr. John Langham, 9 Albert Square, Manchester, joint architects; second premium, 200*l.*, to design No. 25, Mr. George Watson, architect, 50 Queen Street, Edinburgh; third premium, 100*l.*, to design No. 19, Messrs. Mangnall & Little woods, architects, 42 Spring Gardens, Manchester.

It has been Decided to change the existing south window in Bagshot parish church for one filled with stained glass in memory of the late Queen Victoria. Her Majesty always took a keen interest in this congregation, and one of her last public visits towards the end of her reign was paid to a bazaar held in aid of the church funds in Bagshot Park, by the Duke and Duchess of Connaught, whose estate adjoins the edifice. Their Royal Highnesses are taking a personal interest in the memorial window.

A Supplement to the *Berliner Architekturwelt*, entitled *Berliner Kunst*, has been published by Herr Ernst Wasmuth of Berlin. It is to treat of subsidiary arts, and the first part relates to the furniture, stained glass, wall-papers, &c., designed by Herr Otto Eckmann, which are all examples of the latest popular style of the Continent.

Mr. Henry F. Kerr, president, will read a paper on "Melrose Abbey" at the meeting of the Edinburgh Architectural Association on Wednesday next.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BURSLER—Dec. 20.—Competitive plans are invited for an isolation hospital. Premiums of 100*l.* and 50*l.* will be awarded to the designs placed first and second respectively. Mr. Arthur Ellis, town clerk, Burslem.

GLASGOW—Feb. 1.—Schemes, plans and estimates of cost are invited for erection of dwellings for the poorest classes upon ground at Alexandra Park. Premiums of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the authors placed first, second and third in order of merit. Sir J. D. Marwick, town clerk, City Chambers, Glasgow.

HULL—Jan. 31.—Designs are invited in competition for the new art school. Premiums will be awarded to the designs placed first, second and third in order of merit (100*l.*, 60*l.* and 40*l.*). The architect whose plans are carried out will be paid the usual 5 per cent. commission, the premium to merge in such commission. Mr. Sidney R. J. Smith, 14 York Buildings, London, W.C.

LIVERPOOL—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

CONTRACTS OPEN.

ARGENTINE REPUBLIC—Dec. 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

ASHTON-IN-MAKERFIELD—Nov. 28.—For extension of the gasworks. Mr. Niven, gas manager at the gasworks, Ashton-in-Makerfield.

ASKAM-IN-FURNESS—Nov. 28.—For erection of new Primitive Methodist Sunday schools, and heating same and existing chapel. Rev. W. Carr, minister, Slater Terrace, Dalton-in-Furness.

ALNWICK—Dec. 14.—For erection of proposed Duke's school, Alnwick. Mr. T. Pickard, Estates Office, Alnwick Castle.

AYLSHAM—Dec. 2.—For conversion of dormitories into sick wards at the workhouse at Aylsham, Norfolk, installation of a hot and cold-water supply, heating by hot water, construction of invalids' lift and iron emergency staircase. Mr. John B. Pearce, architect, 15 Upper King Street, Norwich.

BAKEWELL—Dec. 13.—For supply of turned and bored spigot and socket cast-iron pipes. Messrs. Sterling & Swann, engineers, Town Hall, Chapel-en-le-Frith.

BAMBURGH—Nov. 29.—For erection of new coastguard buildings, consisting of quarters for two men and a look-out house, at Ross Links, near Bamburgh, Northumberland. Particulars may be seen at the Coastguard Station at Bamburgh, and at the Director of Works Department, Admiralty.

BETHNAL GREEN—Dec. 10.—For water-supply works at the workhouse and for the infirmary, comprising—(1) Enlarging the existing well and lining with iron cylinders; (2) supply and fixing of two gas-engines and pumping machinery; (3) erection of water-tower; (4) supply and fixing of cast-iron tank, about 70,000 gallons capacity; (5) supply and laying of 6-inch mains, &c. Mr. G. H. Hughes, engineer, 97 Queen Victoria Street, E.C.

BIRKENHEAD—Dec. 11.—For laying a 14-inch pumping main, spigot and socket, lead joints, from Station Road, Hooton, to the reservoirs on Prenton Hill, Birkenhead, a distance of 6½ miles. Mr. W. Martin Jones, secretary, Cheshire Water Co., 9 Hamilton Square, Birkenhead.

BOLTON ABBEY—For erection of four houses and appurtenances, Bolton Abbey, Yorks. Messrs. J. B. Bailey & Son, architects, 3 Scott Street, Keighley.

BRADFORD—Nov. 25.—For removal from Duckworth Lane and re-erection at Bankfoot of two temporary car-sheds. Mr. F. E. P. Edwards, city architect, Chapel Lane, Bradford.

BRIDLINGTON—Nov. 26.—For erection of a new wing and other buildings at Marine House, Promenade. Mr. Samuel Dyer, architect, Bridlington.

BRIGHTON—Nov. 25.—For supply of electricity meters for one year from January 1. Mr. Francis J. Tillstone, town clerk, Town Hall, Brighton.

BROMLEY—Dec. 3.—For certain alterations and additions to the laundry buildings at the sick asylum, Devons Road, Bromley, Middlesex. Messrs. J. & S. F. Clarkson, architects, 136 High Street, Poplar, E.

BROWNHILLS—Dec. 2.—For alterations and additions at the Ogley Hay schools, Church Hill, Brownhills, Staffs. Mr. T. H. Fleming, architect, 102 Darlington Street, Wolverhampton.

FREE TO ARCHITECTS.
A PRACTICAL TREATISE ON
WARMING AND VENTILATING
ON APPLICATION TO THE
STURTEVANT ENGINEERING CO. LD.
147 QUEEN VICTORIA STREET, LONDON.

BURNLEY.—For erection of a brewery at Keighley Green, Burnley. Mr. Charles Riley, architect, St. James's Hall.

BURY.—Dec. 17.—For construction of sewage-disposal works, comprising circular precipitation tanks, bacteria beds, channels, sludge tank and roads at Livsey Fields. Mr. John Haslam, town clerk, Corporation Offices, Bury.

CAMBERWELL.—Dec. 2.—For providing and fixing steam boilers, economiser, feed-water apparatus, steam and condense mains, cold-water storage tank, mains and branches, hot-water storage heater, mains and branches, waste-pipes and branches to slipper-baths, slipper-bath valves and all connections, laundry apparatus and machinery to public and establishment laundry, and heating apparatus, &c., complete, to the new public baths, laundry and library now being erected in Wells Street. Mr. Maurice B. Adams, architect, Clement's House, Clement's Inn Passage, W.C.

CHESTERFIELD.—Dec. 13.—For construction of a storage reservoir upon the Bar Brook, between Totley and Baslow. Mr. R. F. Hartwright, clerk to Rural District Council, Chesterfield.

CHISLEDON.—Nov. 25.—For erection of three cottages, Draycot Farm, Chisledon, Wilts. Mr. Robert J. Beswick, architect, 35 Regent Street, Swindon.

CLECKHEATON.—Nov. 30.—For supply of plant to the Cleckheaton Urban District Council as follows:—(Section A) Lancashire boilers; (I) economiser; (J) jet condenser; (K) supply and feed pumps; (L) steam, exhaust, feed and drain pipes; (M) cast-iron water-tank. Messrs. Gibbings & Baker, Piccadilly Mansions, London, W.

WOLVERHAMPTON.—Dec. 9.—For alterations and additions at the town hall. Mr. F. T. Book, architect, Wulfrun Chambers, Darlington Street, Wolverhampton.

A CURIOUS auctioneering incident is described as having occurred at a sale at Tokenhouse Yard, when Messrs. Farebrother, Ellis & Co. submitted three different properties as far apart as Hampstead, Ashtead, in Surrey, and the City of London. When the first-mentioned was brought forward it was knocked down for 4,500l. to a gentleman who subsequently disclosed that he thought he was bidding for Ashtead. On being asked if he would sign the contract, as the property was sold to his bid, he refused, and the auctioneer intimated that he would do it for him and leave the matter in the hands of the solicitors.

AT Monday's meeting of the Edinburgh School Board the report of the school management committee stated that they had had under consideration the question of the appointment of an architect and superintendent of works in room of the late Mr. Robert Wilson. It was agreed to recommend that the same person should hold both appointments as in the case of the late Mr. Wilson, and also that he be paid at the same rate of commission and salary as the late Mr. Wilson. It was likewise agreed to recommend that the Board should advertise for candidates.

TENDERS.

FISHBURN'S LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

By its use in Building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c. Cost of the Winch covered in a few weeks.

This Machine will be found invaluable in Warehouses, Factories, Maltings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building.

The Machine is so named because of its adaptability as means of lifting or lowering articles and materials of every kind with great despatch and Safety.

FOR CATALOGUES, PRICES, TESTIMONIALS, &c., APPLY TO

A DEPUTATION from the Netherlands Government visited Dover on the 16th inst., inspecting the plans, charts and works of the new harbour, with a view to making Dover a port of call for Transatlantic and Netherlands traffic. The deputation consisted of M. Lemans, chief inspector of works at The Hague; M. de Jonghs, director of public works at Rotterdam, and M. van Woelderen, a director of the Zeeland Steamship Company. To meet them were His Excellency Baron Gericke von Herwyven, the Netherlands Ambassador in London, Sir William Crundall and other members of the Dover Harbour Board, and Sir John Jackson. The plans were described by Sir William at a conference held at the Lord Warden hotel, and critically examined by the deputation, who made suggestions with reference to future arrangements at Dover for merchandise as well as passenger traffic, expressing the opinion that in the immediate future Dover would be compelled to provide for a very large transatlantic and continental merchandise traffic.

The POLICYHOLDER'S COMPANY

A POLICYHOLDER'S TESTIMONY.

In acknowledging the receipt of a Cheque for £3,883 6s. 5d. in settlement of Endowment Policy No. 453396 for £3,000, allowing a bonus of nearly 3 per cent. per annum for 10 years; the Policyholder writes:—

"Had I taken a fully paid-up Policy instead of the above amount in cash it would have been £257 in excess of the figures given to me when I took out the Policy 10 years ago. I have given expression to my satisfaction by taking out a fresh Policy in your Company for £10,000 on the Endowment plan."

ad Office for the United Kingdom = = = 16, 17 & 18 Cornhill, London, E.C.
D. C. HALDEMAN, General Manager.

BUILDING AND BUILDERS.

THE Local Government Board has sanctioned a loan of 52,000*l.* for the extension of the Bucks County Lunatic Asylum at Stone.

THE town clerk of Pwllheli has received official intimation of a Government grant of 17,500*l.* towards the projected harbour scheme at Pwllheli.

AT Bolton, on the 16th inst., a slater named James Taylor fell from a house-top into the street below, and was killed instantly. On the same day a similar accident happened to Henry Tate, also a slater, who was working on the roof of a house in Bolton, from which he fell with fatal results.

A LOCAL Government inquiry was held at Greetland by Colonel Luard, R.E., respecting an application by the District Council for sanction to borrow 2,339*l.* for land and the erection of a dépôt, stables, &c., and 1,836*l.* for sewage purposes. The inspector afterwards visited the sites.

A SCHEME is being inaugurated at Handsworth whereby four new churches at least are to be erected in the district. Two of these will be situated in the ecclesiastical parish of St James's, namely, one in Grove Lane, for which the site has been secured, and the other in Rookery Road.

AT a meeting of Annan (N.B.) district committee—Major Carlyle, of Templehill, presiding—it was stated, with regard to the combination between the Town Council of Annan and the Annan district committee for the extension of the hospital, and for sharing equitably in the administration of the building in the future, that the probable cost of the extension would be between 2,500*l.* and 3,000*l.*

A NEW hospital for women and children is being erected in Leeds from the drawings of Messrs. Chorley, Connon & Chorley. The building now in use, which was originally a private residence, has become quite inadequate to the demands on it. It is estimated that the new buildings, which will be erected in sections as the funds allow, will cost altogether about 24,000*l.*

THE tender of Messrs. Collins & Godfrey has been accepted for the erection of the new town hall at Cheltenham, out of nineteen sent in. These were divided under three heads, viz.:

(1) The foundations and main building; (2) the structural connection of the proposed hall with the Winter Garden; and (3) the cost of structural decorations. Messrs. Collins & Godfrey's figures were as follows:—(1) 26,867*l.*, (2) 455*l.*, (3)

1,988*l.* The work has to be completed within twenty months. The architects are Messrs. Waller & Son, of Gloucester.

THE Lincoln City Council have received a direct warning from the Local Government Board of the serious risk they ran in commencing public improvements—or, rather, what they deemed to be such—prior to loans being sanctioned. Two applications for loans were on Tuesday inquired into, the first being for 3,441*l.* for the purpose of acquiring the Grey Friary and adjoining grounds for the purposes of a museum and gymnasium, and the second for 1,500*l.* for the rebuilding of the shops on the High Bridge.

THE Wrexham Waterworks Company are applying to Parliament for powers to construct a new storage reservoir to the north of Ty Mawr farmhouse and to the east of Cae Soff farm. Several new pipe lines will also be laid if the necessary powers applied for are granted, and to carry out these works the company are asking for authority to purchase the necessary lands. The company are also seeking powers to impound the waters of the Pentrebychan Brook and the Moreton and Erwy tributaries of that brook, and of all brooks and streams flowing into the same above the intended new reservoir, all of which waters now flow into the river Dee.

A SPACIOUS villa residence, with stabling, coachman's house, &c., is being erected on Dysart Road, Kirkcaldy, for Mr. James Wishart, from the designs of Mr. David Forbes Smith, A.R.I.B.A., the following being the contractors for the work:—Masons, Messrs. Balfour Bros., Sinclairtown; joiner, Matthew Wishart, Kirkcaldy; slaters, Currie & Cant, Kirkcaldy; plumbers, Blyth & Dougall, Sinclairtown; plasterer and tileworks, Mr. Henry Masterton, Sinclairtown. This villa is the first to be erected on the land belonging to Mr. M. B. Nairn, just being opened up for building purposes. Mr. David Gilmour is contractor for the streets proposed to be made to the north and west of the site, and also for the laying-out of grounds, terraces, &c.

THE foundation of the new United Free church at Newlands, Langside, was laid recently. The church, which is cruciform in plan, having nave, transepts and choir recess, is designed to accommodate 800, and with the exception of five sittings, all the others will have an unobstructed view of the pulpit. Part of the accommodation is provided in an end gallery constructed over the main vestibule. The principal entrance is by a large porch at the south-east corner, the other two doors being intended for egress. The style of architecture

"SYPHON" CLARK'S PATENT GAS STOVES.

FOR USE WITHOUT A FLUE.

The Most Improved System for Heating and Ventilating Private Houses and Public Buildings.

EMIT NO SMELL. GIVE NO SMOKE.

NO DIRT OR TROUBLE.

NO DANGER.

Mr. D'OYLY CARTE, of the Savoy Theatre, writing of these Stoves, says:—"I used your Hygienic Gas Heating Stoves in this Theatre all last winter, and found them in every way most satisfactory. I think I must have had ten or a dozen of them in various parts of the Theatre, and in the very cold weather we had last winter they succeeded in warming the corridors, &c., admirably. Two of them were used to heat the Business Offices of the Theatre, and they fulfilled this object capably, while apparently in no way injuring the air in the offices—a most important consideration."

Illustrations and full particulars to be obtained of all Ironmongers and Gas Engineers, and of the Patentees and Sole Makers—

"Dowelled, London."

is fifteenth-century Gothic, treated in a simple manner, the principal effect being obtained by the mullioned and traceried windows in contrast to the plain wall surface and strong buttresses. The corner porch is constructed in such a way that it can be continued into a tower at any future time. The feature of the interior of the church will be the large aisle arches, with octagonal piers, all of freestone. Owing to the wide span of these arches and their consequent height, a clerestory is dispensed with, and the church lighted at the side walls by large traceried windows placed high above the floor. The aisles will be simply passages, no pews being placed behind the stone piers. All the windows and doors will show stone jambs inside. The roof timbers will all be exposed, showing an open timber hammer-beam roof. The windows are to be double glazed. The heating is to be by hot-water pipes and radiators. Arrangements are made for the admission of fresh air and the extraction of the vitiated air. The exterior of the church is to be built of Giffnock stone, and the stonework of the interior of Auchenheath stone. It is intended to have the church completed by Christmas 1902. The work is being superintended by Mr. John Sim, inspector of works, and Mr. H. E. Clifford is the architect.

ELECTRIC NOTES.

A VERY satisfactory trial of an electric rock drill was made recently at the Otis Engineering Works, South Melbourne. The drill is to be used in driving a tunnel on the mine of the North Gippsland Proprietary Company, Grant, North Gippsland.

By a large majority the Camberwell Borough Council have decided to supply electricity for public and private purposes within the borough. It was resolved to purchase the existing rights of the London Electric Supply Corporation, Limited, for 25,000*l*.

The number of motors and arc lamps supplied from the Bradford Corporation cables continues to increase. On June 30 there were 708 motors supplied from the Corporation mains, of which 487 were owned by the Electricity Department. The total number of consumers is 1,405, being an increase of 227 in twelve months, or equal to 19.3 per cent. The total number of arc lamps is fifty-one, together with twenty-four incandescents used for street lighting.

At a meeting of the lighting committee of the Leeds Corporation further steps were taken in connection with the lighting by electricity of East Parade, Infirmary Street, Park Lane, Cookridge Street and Woodhouse Lane to Blackman Lane, the work in connection with which will be put in hand at once. The lighting will be by arc lights on ornamental columns at the side of the road, the height of the lights above the road being 16 feet, or slightly more than half the height of the columns in the centre of the city.

THE inauguration of the Rhyl electric light and refuse destructor works, which have recently been completed, took place on the 7th inst. with a series of social functions and an inspection of the works. The combined electricity and destructor works were erected at a cost of 30,000*l*., the method of electric supply adopted being the Assen three-wire system with a declared pressure of 230 volts at consumers' terminals. In all some sixteen miles of cables had been laid, the system being paper and jute insulated lead covered and laid solid with bitumen in creosoted troughs. The lamps of consumers connected represent about 2,000 8 candle-power lamps: There are also 56 twelve-ampère 16-hour arc lamps, 36 of them along the promenade.

ITALY claims to rank first in electrical undertakings. Her local tram lines have long been driven by electricity, and lately she has extended the system to longer journeys for passengers as well as goods. In the year 1900 110 kilometres (about sixty-six miles) of the Lecco-Sondria and Colico-Chiavenna lines were coached for passengers and goods by electricity. The same may be said of the Milan to Ponte Ceresio line. The electric line between Milan and Monza will soon be followed by that from Bologna to Modena, and another from Bologna to St. Felice. The largest Italian railway companies, the Mediterranean and the Southern, are considering the question of electric installation, the trial of electricity on the shorter lines having been more or less an experiment with a view to its general introduction on all the railways at no distant date.

At Birmingham on Friday last the city surveyor, Mr. John Price, in the name of his staff, presented Mr. Russell Tippetts, a popular member of his engineering department, with handsome cases of razors and pipes. Mr. Tippetts has obtained a valuable engineering appointment in Mexico on sewerage works and waterworks of considerable magnitude which are being executed by Messrs. S. Pearson & Son.

THE MAY-OATWAY FIRE ALARM

Licensed by H.M. Postmaster-General.

No greater fire loss than £10 has ever happened in any building protected by this system, and no one has ever been injured or lost. Whether the premises are occupied or not it is impossible for any fire to burn for more than a few seconds without giving its own alarm, and that at a period early enough to insure its suppression by half a dozen buckets of water. Approved by every Tariff Insurance Office and Fire Brigade in New Zealand, and solely used by the Government of that Colony for the protection of national property where the lives of inmates are concerned.

SIR EYRE M. SHAW (late London Fire Brigade),
Chairman.

TIME AND INSTANTANEOUS SHUTTERS.

The THORNTON-PICKARD MANUFACTURING CO., Ltd., Altrincham.

TRADE NOTES.

H.M. REVENUE OFFICES, Liverpool, have lately been warmed by Messrs. John King, Limited, engineers, Liverpool, by their improved "Rahnee" radiators, fitted with patent "Rex" radiator valves.

APROPOS of the opening of the new Board schools in Wesley Street, Farsley, to which we referred last week, Messrs. Roger L. Lowe, Ltd., of Farnworth, ask us to mention that the floors of this building are laid with their patent pitch-pine wood-block flooring.

THE extensive alterations which are to be made in connection with the Royal apartments at Epsom Grand Stand will embody an electric passenger lift, the order for which has been entrusted to Archibald Smith & Stevens, Queen's Road, Battersea, and it is interesting to know that the whole of this machine will be of home manufacture.

ELECTRIC LIGHTING BOARDS (British Manufacturing Co) Ltd., have transferred their sales department to 9 Grosvenor Mansions, Victoria Street, Westminster, which will serve as the head depôt. The company's counting-house was also transferred to this address on November 1. A company described as Belgian Electric Lighting Boards, Ltd., was incorporated under Belgian law at Brussels at the beginning of the month, the principal shareholders being Belgian builders and contractors, and the directorate comprising Mr. Justin Alardin, sen. (chairman), Messrs. Edwin O Sachs, Justin Alardin, jun., and George Mombel. This company will work the parent syndicate's patent rights throughout Belgium and Holland.

WE are pleased to note that the electric fire-alarm of the May-Oatway Fire Appliances, Ltd., to the great value of which we have had occasion more than once to refer, is now attracting the attention it deserves. Among other installations of this automatic system we understand that the Ilford Urban District Council have contracted with the company to equip the new town hall with the apparatus, and to place it in direct communication with the fire brigade station. This will be the first town hall in Great Britain of which it can be said that no fire breaking out can exist for more than half a dozen seconds without the alarm being given, the machine calling the brigade and indicating the exact position, extent and course of its fire. Other important negotiations are, we believe, in progress, and we are assured that no fire has ever succeeded in damaging to a greater extent than 10%, and that no lives have ever been lost in, a building in which the system in question has been installed.

NEW CATALOGUE.

MESSRS. EWART & SONS, of Euston Road, are sending out a new illustrated catalogue of geysers and instantaneous water-heaters, in which will be found a graphic description of their new methods for the instant production of hot water for whatever purpose it may be required, the medium for heating being gas or oil. Several varieties are illustrated of the "Califont," for supplying hot water instantly under high pressure with or without circulation. A convenient combination of geyser with shower-bath arrangement and lavatory supply is also shown, as well as a variety of baths, boilers, radiators, urns, &c.

VARIETIES.

THE cross which the Dowager Duchess of Argyll recently erected at Machariorch, an exposed part of the coast of Kintyre, to the memory of the late duke, was blown down and broken during the recent gale.

DURING the recent storm a new hotel which was being roofed, at North Queensferry, was razed to the ground, and some slight damage was done to the piers and the loading banks near the village.

AT Cockerton on Saturday last the Bishop of Durham consecrated a new church. The style of the building, which will seat about 200, is Early English, and the work has been carried out by Messrs. J. P. Pritchett & Son, architects, of Darlington.

IT is gratifying to learn that Messrs. Head, Wrightson & Co., Limited, the well-known bridge builders, of Stockton, have just secured, despite the competition of American firms, a very large order for bridgework to replace that destroyed during the war in Natal.

MESSRS. BELTON & SONS, auctioneers, will sell by auction on Tuesday, the 26th inst., the freehold licensed premises known as the Grand Hotel, Henley. The building is an entirely new one, and has been furnished throughout by Messrs. Oetzmann & Co., of Hampstead Road.

THE associate section of the Edinburgh Architectural Association held a meeting on the 13th inst., in their rooms, 117 George Street, Mr. J. Stuart-Syme in the chair. Mr. W. S. A. Gordon read a paper on Canterbury Cathedral, and sketched its history from the landing of Augustine in England.

n 597. Brief sketches of York and Beverley were also given. The lecture was illustrated by limelight views.

A NEW mission church at Penruddock, six miles from Penrith, was consecrated on the 16th inst. by the Bishop of Carlisle. The parish of Greystoke, of which Penruddock forms part, used to be one of the largest in the North of England, but from time to time chapelries were formed which became separate parishes. The new church will meet the needs of another district, Penruddock being over two miles from the parish church.

REPAIRS have recently been made in some of the more dilapidated parts of Linlithgow Palace. Chief among these has been the wall on the north side of the quadrangle and the apartment known as Queen Mary's room, where the old lintels have been replaced by new ones. The ancient fireplace has also been strengthened by the erection of an iron lintel. Repairs of a more or less important nature have been effected on other parts of the Palace, and also in connection with the dock harbour.

AN important seizure of a large quantity of Belgian cement has been made at Deganwy by H.M. principal officer of Customs, Mr. J. W. Mortimer, of Conway. The *Lord Devon*, from Antwerp, arrived at Deganwy last week with a cargo of cement consigned to Mr. Joseph Parr, builders' merchant, carrying on business at Bootle, Ramsey and Deganwy. On part of the cargo being discharged, the remainder was found to be packed in bags branded on one side with the name and style of Mr. Parr, and on the other with the legend, "Portland Cement." The officer of Customs suspected something wrong, and has detained the cargo under the Merchandise Marks Act, and before releasing it he will insist upon every bag being marked "Made in Belgium."

At the last meeting of the Woodford (Essex) School Board, Mr. W. S. Page, the chairman of the building committee, reported that the committee unanimously recommended the adoption by the Board of the plans submitted by Mr. E. Tidman, C.E., the architect, for a block of new schools to be erected in Snakes Lane for the Woodford Bridge and Ray Lodge districts. The proposed schools will be a two-storey building, and will provide at first for 700 children (300 infants, 200 girls and 200 boys), and with provision for an extension to the total of 1,000 when complete. It was resolved to adopt the plans, and Mr. Tidman was instructed to submit them for approval to the Board of Education without delay.

THE persons interested in the Manchester Market Street area improvement scheme, which came before Parliament last year and failed to win the approval of the committee of the House of Lords, have decided to renew their application in the next session of Parliament. A meeting of the shareholders in the Manchester City Properties Company, Ltd., was held on Tuesday, and it was unanimously resolved that another application to Parliament be made to carry out the scheme. The notices will be published in due course, and plans will be deposited in Parliament on or about November 30, in accordance with the requirements of the statute. Mr. W. H. Vaudrey is still the solicitor to the promoters, and Messrs. W. Telford Gunson & Son are the architects.

A CHURCH of fine dimensions and appearance, which has been erected at Stirchley, Warwickshire, on a site abutting on the main Pershore Road, has been recently consecrated by the Bishop of Coventry. The new building, which has kneeling accommodation for 578 persons, is in the Later Decorated style of Gothic architecture, and has a nave 82 feet long and 35 feet wide with ambulatory aisles borne upon five low but bold arches. The chancel is 32 feet 6 inches by 22 feet, the roof being waggon-shaped and divided into panels, whilst there is a seven-light east window. On the south side are the clergy and choir vestries, the latter being carried up as a tower in which is the organ chamber. There is a ringing-loft and belfry, in which provision has been made for a peal of eight bells. At the western end of the nave, and connected with it by a triple arcaded and traceried opening, is an apsidal-shaped baptistery, which constitutes one of the most striking and graceful features of the church. The baptistery, together with the two western bays, has been built by the vicar of King's Norton as a memorial to his parents, both of whom have died during his tenure of the living. The walls throughout are of brick, with external dressings of red terra-cotta, and the internal piers, arches and other dressings are in selected Farleigh Down Bath stone. A three-manual organ possessing good tone has been presented, and, including the price of the instrument, the total cost of carrying-out the scheme is estimated at 8,400*l*.

NEW police stations for the Bradshaw and Belmont districts of the Bolton petty sessional division of Lancashire have been completed at Bradshaw and Belmont, and both buildings are now in use. They have been designed by Mr. Littler, the county architect, and their erection has been supervised by Mr. John T. Parker, clerk of works for these and other county

NEW CATALOGUE FREE ON APPLICATION

undertakings. The new station at Bradshaw is situate immediately opposite the parish church, and has been erected at a cost of 3,500*l*. The style of architecture is a Gothic peculiar to the county, and seen from the roadway the structure has a fine appearance. It is mainly of bricks supplied from Huncoat, Accrington; the dressings are of Holmfirth (Yorkshire) stone, and the carving has been undertaken by Messrs. Selle, of London. There are two cells which will accommodate four prisoners each, the cells being filled in with glazed brick in colours. The charge office will also serve as a parade room for the staff, and there is excellent convenience for the sergeant in charge, including parlour, kitchen, scullery, pantry, three bedrooms, bathroom and lavatory complete. There is a cellar underneath and complete heating apparatus. A weights and measures office is also provided. The Belmont new station is situated on the main road leading into the village, immediately opposite the Independent school. It is constructed of Whinnehill bricks, with Holmfirth stone dressings. It is smaller than the Bradshaw station, and the cost is correspondingly lower—about 2,300*l*. There is a charge office, two cells, and suitable accommodation for the constable who will be in charge, the rooms including front living kitchen, scullery, pantry and three bedrooms, with bathroom over.

TYNECASTLE CHURCH, Edinburgh, which was opened on the 9th inst., has a frontage of 66 feet, and to secure better light for the portion of the interior darkened by some neighbouring tenements two entrances are provided, one near either extremity. The building is constructed with nave, 94 feet by 29 feet, and aisles 64 feet long, the total width being 51 feet. These divisions are indicated on the front by buttresses of varied size, but the same projection, finishing at the top with pinnacles and carved finials. One larger than the rest is completed as a belfry. Vestibules and gallery staircases are provided with the entrances, and below the circular arch which carries the east staircase is a pend, open to the passage leading to the hall behind the church. The plans, by Messrs. Hardy & Wight, are in Decorated Gothic. The doorways have richly moulded piers, with engaged pillars and arches to correspond. The gallery at this end is lighted by a large window, 20 feet by 10 feet, having the moulded mullions and elaborate tracery of the style. The space under the gallery has five moulded lancets. The upper windows at the sides are also large, with the mullions and more simple tracery of the style, in order to diffuse a better light in the area below. The interior has a ceiling boarded nearly to the ridge both in nave

and aisles. It is heated by hot-water pipes carried above the floor, which is laid solid on a bed of asphaltic composition. The decoration of the newly plastered walls is simple, tinted in primrose yellow, relieved by blue marginal lines and some stencilling in the apse. The general tone of the furnishings is lighter and darker walnut. The windows are glazed with clear glass in large panes, with blue and gold border in leaded panels. The church is seated for 1,000, including choir and elders' seats. A communion table and chairs in oak, with decorated details, and a stone font, have been presented to the church, which will cost under 4,000*l*.

ART IN LAMBETH.

THE gratifying success attending the work of the Art Institute founded by the late Sir Henry Doulton, is abundantly shown by the very interesting loan collection of pictures, sculpture, &c., which is now on view at the Doulton Institute in Lambeth High Street. The exhibition, which has been admirably arranged under the auspices of Mr. J. C. L. Sparkes, late of the South Kensington School of Art, consists almost, if not quite exclusively, of the work of past students of the institute. Many of the works shown are of high artistic merit, and have been seen before at the various picture exhibitions, and among these the place of honour is assigned to Mr. Walter Oulless, R.A., who is represented by his well-known portrait of Cardinal Manning, and another not less excellent of Mr. P. M. Westlake. From among the students of the institute the artists employed by Messrs. Doulton & Co. are largely enlisted, and the ability of some of these is not by any means confined to the decoration of pottery, one exhibitor, for instance, showing, besides specimens of his artwork, a bicycle, a mandoline, and an electric battery, all specimens of his individual handiwork.

A BRICKMAKING DISPUTE.

ON the 12th inst. His Honour Judge Martineau was occupied for some hours at the Horsham County Court in hearing an action brought by Messrs. Hull & Redford, builders and brick-makers, of Horsham, against William Myson, formerly a brickmaker. According to the *Sussex Daily News*, plaintiffs' claim was for the amount overpaid by plaintiffs to defendant on account of defendant's contract to make bricks for plaintiffs during the season 1900-1, 46*l*. 1*s*. 4*d*.; balance due to defendant on contract for 1899-1900, 11*l*. 16*s*.; damages sustained

by plaintiffs owing to the defendant's improper making and stacking of bricks during season 1900, 15*l* 15*s*. 6*d*. There was a counterclaim as follows:—For balance due for making bricks during 1900 season, 11*l*. 16*s*. 10*d*.; digging and soiling for 600,000 at 2*s*. 6*d*. per 1,000, 75*l*.; less drawn on account, 70*l*. 14*s*., leaving balance of 4*l*. 6*s*. The total amount of counterclaim was 16*l*. 2*s*. 10*d*.

Plaintiffs in the autumn of 1898 opened a brickyard upon Spencers Farm, Horsham. In that year defendant was engaged to make bricks for the season at the rate of 12*s*. 6*d*. per thousand, and this arrangement was entered into until the last week in March 1901, when defendant left in order to become the licensee of a public-house. The plaintiffs' contention was that defendant was to dig soil, make and burn bricks for 12*s*. 6*d*. per thousand, and by arrangement he was to make the back ground and keep it in repair. This contract continued the following season, and also during 1900-1. Defendant was paid 70*l*. 14*s*.; each week he drew what he required.

Mr. Rawlison, for plaintiffs, said no account or check was kept about overdrawing, but he submitted that very much was drawn in advance of work actually done. In consequence of His Honour's decision in a previous case at that court plaintiffs were not going to proceed with any claim for breach of contract.

William Hull, one of the plaintiffs, bore out this statement, and added that defendant left the last week in March. A man named Gear was employed, and surveys were taken. Before defendant left he did not make any application for measurement. Neither had he since. He had not made any claim for money which he considered he was entitled to. After Mr. Potter measured the clay, Messrs. Smith & Son were called in and witness found a great difference in the surveys.

Thomas Redford, another plaintiff, having over twenty years' experience in brickmaking, said no question was raised as to whether defendant would be paid for rough ashes. Defendant had no rough ashes to use, except in the second season. The sum of 12*s*. 6*d*. would be the price to pay a man using rough ashes. In the second year the bricks were bad.

George Gear stated that the usual price for digging and soiling was 2*s*. per thousand, 1*s*. 6*d*. for digging and 6*d*. for soiling. He paid his men 42*l*. 15*s*. for digging and soiling.

J. R. Pocock, assistant at Messrs. Smith & Son's, land and estate agents, took the measurements of a heap of clay, which he estimated 839½ yards.

Sydney Smith, of the firm of Smith & Son, spoke as to the accuracy of this measurement.

Harry W. Parsons also gave evidence.

John Burrage, a brickmaker of thirty years' experience, said 2*s*. was the price for digging and soiling. He never received anything extra for rough ashes. He had to take the ashes as they came. The better the ashes the better was the work for the men. Defendant told witness that he had a lot of rough ashes, but that he did not intend to sift them. Defendant did not say that he was paid 6*d*. per thousand for sifting them. Witness should require extra for hacks.

This was plaintiffs' case.

Defendant was called, and said he had been a brickmaker for thirty years. He made the bricks for 12*s*. 6*d*. per thousand. Nothing was said by plaintiffs about keeping hacks in repair. He agreed to make them for the first year, and without any remuneration. The first year there were no rough ashes, but in the second year they were all rough. The bricks were made properly, but the soil would not stand knocking about. He dug as deeply as he could for the soil, but the soil was bad. In cross-examination, witness stated that when he found rough ashes he asked for extra pay, but plaintiffs told him that he would not get any rough ashes.

George Burstow, who worked in the field, said the soil was light, and Frank Potter was called in respect to his measurements of the heap of clay, which he said was 1,500 yards.

Mr. Humphrys, for defendant, submitted that in regard to the claim for bad workmanship that this was a pure afterthought. It was the plaintiffs' soil, and unless there was bad workmanship there was no claim in the least degree, as it had been stated that the soil was bad. Plaintiffs did not object to defendant having the money, and this he contended was sufficient for them to think that defendant had done enough to warrant them giving him the money. What His Honour had to arrive at was a fair price for digging and soiling, and this he would have to do.

His Honour (interposing): In the best way I can.

Mr. Humphrys dealt with the measurement figures, and Mr. Rawlison in reply submitted that the defendant's figures were arrived at in a rough-and-ready manner and not scientifically like those of the plaintiffs.

Mr. Rawlison was about to deal with the question of damages, when His Honour said he did not think there was anything in the shape of a claim.

Price 2*s*.—Office: Imperial Buildings,
Ludgate Circus, London, E.C.

Mr. Rawlison said originally the damages would have been in respect of breach of contract; and in regard to the bad bricks these were partly due to the clay, but not entirely.

His Honour reviewed the evidence and said the valuation was made as to the work done. Two valuers were employed—Messrs. Smith & Son and Mr. Potter—and the under-accurate measurement was that of Messrs. Smith & Son. He, however, accepted Mr. Potter's valuation. He thought three yards must be allowed for a thousand bricks. On the other hand, Mr. Potter had allowed 2s. 6d for digging out and soiling, and he was only going to allow 2s. He therefore gave judgment for plaintiffs for 27l. 19s. He was not going to allow anything for damage because he had a strong suspicion that the bricks were indifferently made. It was not due to wilful negligence or breach of contract on the part of Myson. He entered judgment for defendant on the counterclaim for 11l. 16s.

METROPOLITAN ASYLUMS BOARD.

A MEETING of the managers of the Metropolitan Asylums District was held on Saturday last. A letter was read from the Local Government Board formally approving the plans of the Southern Hospital; promising an order authorising an expenditure of 284,312l. on the hospital, and the borrowing of that sum; stating that the loan should be repaid as to 264,312l. in thirty years and as to 20,000l. in fifteen years, and that managers would be expected to adhere as nearly as possible to the estimated cost in carrying out the works. At the last meeting of the Board it was decided to complete forthwith the permanent hospital at Joyce Green by the erection of the remaining twelve blocks and the isolation block for patients, and the works committee were instructed to advise the managers as to the course to be adopted for giving effect to that decision. It was now resolved, on the recommendation of the committee, that subject to the sanction of the Local Government Board, the managers should accept the offer of Leslie & Co., Limited, the contractors for the erection of Joyce Green Hospital, to erect and complete the remaining twelve pavilions, isolation hospital, and other works connected therewith at a schedule of prices based on their contract for the main portion of the hospital, in accordance with plans and specifications prepared by Messrs. A. & C. Harston, architects.

BUILDERS' BENEVOLENT INSTITUTION.

THE fifty-fourth annual dinner of the Builders' Benevolent Institution took place at the hall of the Worshipful Company of Carpenters, Throgmorton Avenue, E.C., on Thursday, the 14th inst. Mr. J. Carmichael (president of the Institution) occupied the chair, and amongst those present were Mr. G. I. Fellowes-Prynn, Mr. J. Howard Colls, Mr. D. Duff, Dr. R. Oram, Mr. W. B. Brown, Mr. K. D. Young, Mr. T. Brooke Hitching, Mr. A. Ritchie, Mr. W. Gilbert Scott, E. P. Anson, Mr. H. N. Lancaster, Mr. J. Gibson, Mr. T. Hare, Mr. J. Wigley, Mr. A. Masson, Mr. F. Farquharson, Mr. B. P. Ellis, Mr. A. E. Parker, Mr. B. Woodward, Mr. Scott Balfour, Mr. H. Holloway, Mr. R. J. Greenwood, Mr. H. Barlett, Mr. J. Randall and Mr. T. Rider. The company numbered altogether about 200.

After the usual loyal and patriotic toasts the Chairman proposed the toast of the evening, "Success to the Builders' Benevolent Institution." He pointed out that the object of the charity was to relieve men who had been builders and business for at least ten years, whose age must not be less than fifty-five, whose character would bear the strictest scrutiny, and who were now in poverty and want. He had often thought had he been a Carnegie, nothing would have given him greater pleasure than to search for and find out the thousands of poor but honest tradesmen scattered throughout the length and breadth of our land, so that he might help and assist them. He believed there was no more deserving class of men, and none who would more highly appreciate a little financial aid. The cause was a good one, and, whilst they were exceedingly grateful for all donations received, he wished to make a special appeal to all London builders to help this deserving charity by becoming regular annual subscribers. This was essentially builders' charity, and ought to be supported by builders. Our merchants did nobly, but he regretted he could not say the same of some of our builders. The annual subscriptions had fallen off considerably this year, but he hoped they would make up the deficiency that night. The funds were administered with the greatest possible care and a minimum of cost. It might well be written over the doorway of the committee-room, "No impostors need apply." In conclusion he asked the company to remember the words of his fellow countryman, Thomas Carlyle, "I pass through this world but once, therefore any good thing that I may do or any

BUILDING SPECIALTIES.

indness that I may show, let me do it now; let me not neglect, as I shall not pass this way again."

The other toasts were "The Worshipful Company of Carpenters," proposed by Mr. B. J. Greenwood and responded to by Mr. John Wilson, J.P., the Worshipful Master of the Carpenters' Company; "The President," proposed by Mr. A. Ritchie, J.P., and responded to by the Chairman; "The Architects and Surveyors," proposed by Mr. J. Howard Colls, and responded to by Mr. G. H. Fellowes-Pryne, and Mr. W. Blumfield Brown; and "The Vice-Presidents, Committee and Stewards," proposed by Mr. Henry Holloway and responded to by Mr. E. J. Lough.

During the evening the secretary, Major R. A. Brutton, read the list of subscriptions and donations, which amounted to £1,019/3s. The President's list showed a total of 948/17s.6d, towards which the President himself contributed 105/.

CO-OPERATIVE TOWNS.

MEETING was held lately in Coventry to consider the "Garden Cities Scheme." A paper was read by Mr. A. Williams, in which he said:—

Overcrowding and high rents have become a national calamity. Not only do respectable workers lose a large part of their wages in order that the owners of town sites may draw large sums for doing nothing. That would be an injustice, but when we consider how the young people are constantly streaming from the country to the towns to find work, how the high rents compel many of them to crowd together in slums, and to bring up their families under conditions which are demoralising to character and destructive to health and strength, we are bound to recognise that a great national regeneration is going on. Thousands of lives are being lost, and what is still worse, the quality of our race is being deteriorated.

Some remedy for such a state of things is a crying need of times. Of course the simplest remedy seems to be to enforce sanitary regulations and prohibit overcrowding. Yes, if you turn the people out of the slums and overcrowded tenements, where are they to go to? There are no good places for them. "Well, then," some will say, "let the municipalities build houses." A good enough answer perhaps

up to a certain point, but even if the municipality can find vacant land in the town it will be excessively dear, and so usually will be the houses erected on it. In big towns, however, there is little or no vacant land. The municipality buys up slums at a huge cost and puts up high blocks of tenements. Even so it often does not accommodate more people than it displaces, and the new homes are far too dear for the very poor who were turned out. They, poor creatures, just move on and overcrowd the next handiest locality, and new slums are created. Even if more people are accommodated, the result is just to attract more people from the country, and in the long run rather to increase the overcrowding than relieve it. Meanwhile part of the expense is likely to fall on the rates, and the workman finds his home costs him more than ever.

Apparently there is no real cure available in the present for the evils of overcrowded towns. At least, so we might have said two or three years back. But about that time there came out a book called "To-morrow," by Mr. Ebenezer Howard, who offers us a remedy essentially different from any of those we have considered. It is not enough to reform your existing cities, he says, still less to build on to them. What you want to do is to build new cities, and to build them on a rational plan, not haphazard. Don't merely move your homes to the outskirts, but move men and factories together to new sites where they can enjoy the advantages both of town and country life. Thus you will not only have new model cities, but incidentally you will render easier the improvements of the old ones, because you will relieve the pressure upon them. Manufacturers even now are sometimes moving their factories out into country places because high rents and rates are killing their trade. Systematise this, says Mr. Howard, and get a number of manufacturers and, if possible, of co-operators also, to move out together. And this is how he proposes they should do it. Let them combine to buy, say, 6,000 acres of land somewhere where it can be got at agricultural value, but it must be near a railway. In the middle of this let them build a garden city, that is, a city which shall have a conspicuous feature, gardens, both private and public. By building on this land they will very greatly raise its value. What perhaps cost 20/ or 40/ an acre will become worth 500/ an acre in its central part, but all this increased value they will retain for themselves, not make a present of it as an "unearned increment" to a ground landlord. Let them, moreover, build on a plan and so secure open spaces, gardens, sanitation, convenient public buildings, in fact, all the conveniences of the

best town life together with those of country life. For the country will be all around them.

Manufacturers are moving out into country places, but they are doing so in quite an unorganised way—one here and one there. Garden City, on the other hand, is to be an organised movement. Compare the advantages of the two things. To move into the country a single manufacturer must have a large capital to build his own factory; he must make his own arrangements for sidings and so on with the railways; further, he must either find money to build houses for his employées, or he must leave them at the mercy of the speculative builder or whatever else fate may bring them. That establishing industries in country places in a disorganised way by no means necessarily leads to good results is shown, I think, by the condition of Cradley Heath and similar places round about Birmingham. Moreover, the single manufacturer, when he has moved, finds himself cut off from the help of the many trades to be found in a city, and one result of his enterprise and hard work is to give away a great part of the wealth produced in the shape of an unearned increment to the ground landlord. In an organised movement, on the other hand, it should be easy to find investors whose capital will build factories and houses; advantageous arrangements could be made with the railways; the whole increased value created by the industry of the place would be retained for those who made it; one factory would in many ways help another; one would employ men, another chiefly women; one would be busy at one season, one at another; subsidiary trades would grow up. There would be a variety of choice of employment for the young people and the inhabitants would have society.

Meanwhile Garden City Association, founded to make known Mr. Howard's ideas, appeals to the general public as well as to co-operators. Its plan is not only co-operative, but so far as ownership and development of the land goes it is purely so, and for the rest, it will necessarily give splendid opportunities for co-operation in all forms. The first thing needed will be much building and road-making, and here will be a first-rate opportunity for a co-operative builders' society. Then, as soon as there are a few inhabitants, a store will be needed, for they will certainly not wait for little shops to grow up, or for Liptons to start a branch. Then will come co-operative cottage owning, printing and engineering. Perhaps a creamery and jam making, and so on. Some of our co-operative productive societies, which already

have established businesses, may even find it worth while to move their factories or establish branches in Garden City. At the present time I know of one of the largest of them which is making plans to move out into the country. Of course very many points will require careful consideration, and Garden City Association has sub-committees already at work considering such questions as the choice of site, the kind of leases to be granted, the drink traffic and the smoke difficulty. So much for co-operators. The private employer for his part will find better accommodation at a lower rent, and, as Mr. Caddell told us the other day at Bournville, he will find that it is good business to move to a place where he has plenty of room to expand. Indeed, some manufacturers have already expressed their willingness to start business in Garden City.

It is intended after getting the option of a suitable estate to register a limited liability company with a large share capital—perhaps 100,000—perhaps a good deal more. There ought at least to be enough share capital to buy out and out the estate chosen. Interest on shares will be limited to 4 or 5 per cent, and as soon as possible after the city is established the whole property will be made over to the actual inhabitants subject, of course, to their paying off the shareholders and carrying on the work on the principles on which it started. I do not suggest that any co-operative societies should invest heavily in the shares of this company, though it is difficult to see that such an investment could be very risky; but I could wish that each society would take a moderate number of shares in proportion to its membership. Later, again, money for the development of the estate may be wanted on mortgage or debentures, and this should afford our societies a first-rate investment. It may be said, and truly, that drawing 30,000 people into a garden city would not greatly relieve the overcrowding of our great towns. But if the first be successful there will certainly be more to follow. Other companies may be formed, and town councils and county councils may form garden cities of their own, once the practicability is proved. In that case, why should not the stores and the co-operative wholesale society and the co-operative workshops of the country combine to found one such settlement of their own on purely co-operative lines? In addition to all that I have already described, it might have near it a great co-operative convalescent home; it might be a holiday resort for co-operators with a summer camp for lads and young men, a school of cycling, a golf-links, a cricket-ground, and I know not what else.

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to the Drawings, says:—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and lectures at Oxford, spoken of the sketches of Prout with reverent enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no one however sensitive in his admiration—ever gave the proportionate grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately: there are no existing true records of the real effect of Gothic spires and towers—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

NATIONAL ASSOCIATION OF MASTER PLUMBERS.

THE half-yearly meeting of the National Association of Master Plumbers of Great Britain and Ireland was held in Bolton on the 13th inst., in the Sale Rooms, Bowker's Row. There was a large and representative gathering of delegates from all parts of the United Kingdom. The business part of the proceedings was conducted in private, but at the close of the morning session the delegates, to the number of nearly a hundred, were entertained to dinner by the local branch at the town hall. The mayor (Alderman Miles, J.P.) had kindly lent the banqueting-room for the occasion and also attended in person, being supported by the deputy mayor (Alderman Nicholson, J.P.), Mr. Isaac Jones (president of the local branch), Mr. J. T. Vause (vice-president), Mr. D. Cuerden (treasurer), Mr. R. Walsh (secretary), Mr. W. L. Harrison, Hull (president of the National Association), Mr. J. Beal, Hull (secretary of the National Association), Mr. A. S. Dyson (treasurer of the National Association), Councillors J. W. Witter and D. Maginnis, and many others. An excellent repast was served up by Mrs. Priestley, after which the Chairman proposed the toast of "The King and the Royal Family," which was received with musical honours. The Mayor was next called upon to submit "The Delegates and Visitors," and was enthusiastically greeted on rising. He said he was glad, as his first official act as mayor, to have the privilege of meeting such a body of men from all parts of the country. They were formed into an important Association whose objects were good, their motto being "Defence, not defiance." That was their first visit to Bolton, but he hoped it would not be the last. He was pleased, as mayor, to give them a most hearty welcome and to express his appreciation of the excellent manner in which the Association was doing its work in the way of conciliation, a word he was very fond of. Disputes would arise whatever they might do to avoid them, but if these disputes could be settled in a conciliatory manner how much better it would be for the world. That was one of their main objects, and he wished them every success in carrying it out. He had been reminded that there was a little fault to find with Bolton on account of the trading of the waterworks and gas committees, but he was not going to enter into anything controversial that day, and would conclude by proposing the toast.

Mr. Harrison (Hull) responded in a humorous speech, in

which he spoke warmly of the hospitality extended by the Bolton people, and trusted that when the plumbers came again they would find Councillor Witter wearing the mayoral chain. He congratulated Bolton on being a progressive municipality, remarking that it appeared to him Bolton had everything Hull possessed but a crematorium.

Mr. Skirrow (Leeds) proposed "The Mayor and Corporation," and Alderman Nicholson responded, remarking that to the uninitiated the plumbing trade was certainly unknown. Still, it was a trade that had many excellent members, amongst whom he mentioned Alderman Vause, who had rendered splendid service to the town of Bolton as chairman of the streets committee. He spoke of Councillor J. W. Witter's great victory in Smithills Ward, and trusted his services would prove as valuable as those of Alderman Vause.

Alderman Nicholson next commented on the variety of the Bolton industries, placing Bolton only second to Manchester and Liverpool for its splendid works and workers. Bolton as a manufacturing town was A1, and Bolton plumbers ranked A1 amongst traders.

Councillor Witter also responded in a few happy remarks.

Mr. J. Beal (Hull) toasted "The President" (Mr. I. Jones), whom he described as a man of genuine grit. He went on to say there were evils in their trade they were trying to remedy, and he asked the mayor and the deputy mayor to help them in securing fair play, which was all they wanted as traders.

Mr. Jones appropriately responded, and the business portion of the proceedings was then resumed at the Sale Rooms.

EDINBURGH CASTLE.

THE finished drawings of the new buildings which are to be erected in Edinburgh Castle are now on view to the public in one of the committee-rooms of the City Chambers. They have been prepared at the War Office under Major Hemming, R.E., and show a building of the castellated or Scottish baronial style of architecture, providing officers' mess-room accommodation and quarters for seventeen officers and their servants. The new structure, which is 124 feet long and 100 feet deep, is for the most part two storeys in height, but the fall in the ground at the north side is utilised for the kitchen, cellars, offices and servants' quarters, and that part of the building is thereby increased to four storeys. The site is on the old Mills Mount, to the immediate east of the recently-erected military

hospital, and the barracks now occupying the site will be demolished to make way for the new quarters, the design of which is in harmony with the architectural features of the existing buildings. On entering the castle the new building will be to the right, after passing the Argyle battery. The ground-floor, which is entered through a vestibule and hall—in which there is a recess for the band—will contain the principal apartments, including mess-room, ante-room, billiard-room, and the usual mess offices, which communicate with the kitchen by a separate staircase and lift. On the north side of the entrance are suites of rooms for two field officers, one on the ground floor and the other on the upper flat, with separate entrances, and the rest of the building is devoted to bedroom accommodation. In front of the mess there is a terrace, with a stone parapet, and on the north side a spacious flat over the billiard-room commands a view of Princes Street and the Fife coast. The plans are exhibited in elaborate detail, and show all the sections of the work as well as the completed buildings, seen from different points of view, so that one can judge of their effect on the sky-line. There are also four sets of photographs showing the buildings as they now exist and as they will appear when the contemplated erection has been carried out, the views being taken from the north side of Princes Street, the foot of the Mound, the Waverley Bridge and the Calton Hill, and an inspection of the designs and of the different elevations will enable the public to satisfy themselves as to the effect of the proposed alterations from an æsthetic standpoint. The contracts have not yet been let, but it is understood that they will be placed with local firms, and the probable cost is estimated at about 20,000*l*.

KESTEVEN NEW ASYLUM.

ON Wednesday last advantage was taken of the practical completion of the new county asylum at Rauceby, to hold the quarterly meeting of the Kesteven County Council, and the members were afforded an opportunity of inspecting the institution, which will be formally opened in February next.

The asylum, which stands in an estate of 115 acres—the actual buildings covering over 7 acres—has cost 166,000*l*., will accommodate 500 patients, and is elevated 100 feet above the sea level. Trees have been extensively planted, and will in time add to the beauty of the estate. The most modern ideas regarding the treatment of the insane have dictated the

arrangement of the buildings, which were planned by Mr. G. T. Hine, of London, and have been erected by Messrs. Kirk, Knight & Co., of Sleaford. The patients' blocks are placed in the brightest and most sunny aspects, and the quarters of the staff and officers are conveniently situated. The equipment of the premises is on a liberal, if not lavish, scale, the furniture alone costing 10,000*l*.. A feature of the institution is a theatre capable of seating 700 spectators. This has an attractive appearance, the windows being filled in with stained glass, and its accessories are quite professional, a permanent stage and footlights being provided. Another interesting department of the institution is formed by the laundry block, in which modern machinery will be used, the power being supplied by an electric motor. There is also a bakery on similarly up-to-date lines. A well-designed chapel stands detached from the main buildings, and comprises nave and aisles, north and south transepts, an organ-chamber and vestry; it is arranged on lines complete enough to please the most exacting worshipper.

The buildings are of Leicestershire red bricks with Ancaster stone dressings, the roofs being of Vermont green slate. The patients' blocks bulk largely in the façade, but between them are the quarters of the head nurse and house-keeper and the assistant medical officer. The administrative block is between these on the south and the front entrance on the north, and to the east of this are the attendants' quarters, which look into a large court. On the west are the quarters for the nurses, with another large court in front. Adjoining are the laundries, drying ground and mortuary. Each block has two entrances from the main corridors, which are 9 feet wide, paved with wood, and made cheerful by a golden-brown dado of glazed brick. The floors and ceilings are fireproof, being laid by the Stuart Granolithic Company, and the finely-fitted lavatories are the work of Messrs. Douilton & Co. For water-supply purposes there is a tower upwards of 100 feet high, forming a splendid example of brickwork. At its summit are two large tanks, each of nearly 14,000 gallons capacity. These are supplied from borings on the premises, the water being softened by a patent process before its elevation. The motive power for the machinery throughout the buildings is obtained from two massive boilers 28 feet long. The hot and cold-water mains, condensers, &c., are placed in a large subway running under the main corridors. The medical superintendent's house, 200 yards distant, is a most attractive residence, with a greenhouse, stabling and carriage houses.

The Architect.

THE WEEK.

BATTLE ABBEY was sold by auction on Tuesday by Mr. JOSEPH STOWER for 200,000*l.* to Mr. Fox (Messrs. EDWIN FOX & BOUSFIELD), who represented an unnamed purchaser. When we regard it simply as an ordinary estate the price cannot be said to be excessive. The land comprises about 6,118 acres, and the rent-roll is 5,500*l.* In addition must be reckoned the abbey, park, home-farm and extensive woodlands. The timber was recently valued at about 43,000*l.* But the historic interest of the estate should count for much. The possessor of the most memorable battlefield in England and of all that remains of the monastery which WILLIAM THE CONQUEROR founded must always be a noteworthy person. On that account it is to be hoped the latest purchaser will remember that in this case especially property may be said to have its duties as well as its rights. The Duke and Duchess of CLEVELAND recognised that the public possessed some interest in the land, and their example we hope will always be imitated.

WHEN we find the Court of Appeal, consisting of such judges as the Master of the Rolls and Lords Justices STIRLING and MATHEW, differ in opinion as to whether a "crawling board" is a scaffolding, we must not be surprised at the continual litigation which arises out of the slovenly-framed Workmen's Compensation Act. According to clause 7 the Act can be put into operation by any one injured when employed in, on or about any building which exceeds 30 feet in height, and is either being constructed or repaired by means of a "scaffolding." It has been already decided that a scaffolding cannot be a single article such as a ladder or a plank, even when fastened at one end to the rung of a ladder, with the other end on a window-sill, but the scaffolding can be a thing easily movable, and can remain untied or unfastened. In *VEAZEY v. CHATTLE*, which was the action considered by the Court of Appeal, the plaintiff and another man erected a ladder and carried up a crawling-board in order that they might work on the roof. Before the board could be placed in position it slipped and the plaintiff was injured. The judge of the Derby County Court held that the board was a scaffolding, and gave an award in favour of the claimant. The builder appealed. The Master of the Rolls held that previous decisions gave authority for holding that that which not ordinarily could be called scaffolding might be called scaffolding within the meaning of the Act, and his lordship therefore concluded that a ladder might become scaffolding, especially when it was, as in the case before them, part of an arrangement. Lord Justice MATHEW also expressed the opinion that the arrangement was a scaffolding within the meaning of the Act. Lord Justice STIRLING, on the contrary, said the contrivance appeared to him to be only a form of ladder, and indeed ladders were often used in the way it was proposed to use the crawling-board. The combination could not either fairly or properly be called a scaffolding, and therefore the appeal ought to be allowed. But as the majority considered the award of the county-court judge should not be disturbed, the appeal was dismissed.

It is satisfactory to learn that the standards committee representing civil engineers, mechanical engineers, naval architects and iron or steel masters has received much evidence, and will therefore endeavour to obtain uniformity in the various sections which are now rolled in the mills of this country. As we remarked at the time of the appointment of the committee, there was no representative of building construction admitted as a member. It must have been known how largely rolled beams are employed in buildings, and that the want of uniformity in sections was often an inconvenience. The calculations which may be made on a particular section will not exactly apply to another section slightly differing in depth or in width of flanges. Our insular independence, by which each individual becomes a law to himself, is exemplified in rolled joists as much as in other classes of work. America,

that holds so important a place in the world of steel, contrives to satisfy native and foreign customers by means of forty-nine different sections. Germany rolls sixty-seven sections. We require in England no less than 171, or 50 per cent. more than America and Germany united. The same rule applies to rails. Some readers may know by experience how difficult a problem it is to determine the best section for a rail of a prescribed weight per yard, and yet the variety of rails that are in the market is incredible. Now the cutting of rolls is an expensive operation, and it is not to be supposed that the requirements on different railways are so unlike as to prevent the same rail from being used in many places. When we remember the importance which is attached to a very trifling difference between two angles or bars, it is easily understood that the sections required for bridges which have to be put together in a hurry are not always at hand. Concessions which will not be made in England are allowed to Americans, and thus it happens that much work which should have been produced in English yards has come from the other side of the Atlantic.

THE breaking of large plate-glass windows is one of the amusements which the legislature seems to have provided for the roughs in Dublin. One firm this week obtained 31*l.* 11*s.* 10*d.* and another 7*l.* 5*s.* as compensation for the malicious injury to their windows. The Recorder said that the claims were becoming a public scandal, for it was unfair that the ratepayers of Dublin should have to pay for criminal acts, although they no more instigated them than people in Australia. If the windows are insured the insurance companies make the claim, and it is therefore impossible for the people of Dublin to escape from the consequences of acts of criminals. Sometimes the culprit is arrested and convicted, but the compensation has to be provided by others. A remedy is unfortunately not easily provided, for if a change were made in Dublin it would apply to small districts in the country, where it is believed malicious injuries to cattle and property could often be prevented if the people in general disapproved of such acts.]

WE lately announced that tenders were to be invited for roofing the eastern quadrangle of the University Library, Cambridge, according to plans prepared by Mr. W. C. MARSHALL. The outlay was not to exceed 6,500*l.* The subject was brought before Congregation on the 21st inst. The matter had been fully discussed by the Senate, and met with much opposition on various grounds. A number of flysheets had been circulated both by the opponents and by the supporters of the scheme, and so far as weight of authority it was evident that the division would be close. The report of the Financial Board recommending a very large outlay for the purchase of more land from Downing College for the erection of University buildings no doubt had a great influence, as it was urged that at the present time it was inexpedient to incur so great an expenditure, and that the interests of the library would not suffer by delay. On a division being taken it was found that while 158 members were in favour of the roofing, 177 were opposed to it if undertaken at the present time. Tenders will not, therefore, be invited for the work.

THE Prince Regent of BAVARIA has selected several high functionaries and artists to form a consultative committee in connection with various public buildings which are to be erected in Munich, and later in other towns of the kingdom. The Minister of the Interior *ex officio* holds the foremost place, and he will be assisted by nineteen members. Seven will be officials connected with Government departments, who will be able to advise upon the requirements which will have to be provided for. There will be three Parliamentary representatives of Munich and three professors who can be consulted with advantage. Architecture will be represented by Herr VON SEIDL and Herr VON THIERSCH, sculpture by Herr VON MILLER and Herr HILDEBRAND and painting by Herr VON LENBACH and Herr VON KAULBACH. The object of a council so varied in its elements is to attain the utmost architectural success of which Bavarian architects are capable. It is expected also that if Government buildings are attractive they will be taken as models by ordinary citizens when about to erect houses.

ILLUSIONS IN ARCHITECTURE.

TO be given over to illusions is believed to mark a very low degree of spiritual abandonment. But as youth is prone to them they cannot be considered as the punishment of guilt. Some of the most favoured mortals are addicted to them, and without illusions we should have neither poets nor artists. The purpose of imagination, according to a high authority, is to embody the forms of things unknown, and with that sort of creation everyone of an artistic nature must be familiar.

It is hardly an exaggeration to say that among the artists, architects are the most liable to illusions. The common expression *châteaux en Espagne* suggests a connection between them and buildings, and the designer has generally a superabundant and it may be a sorrowful experience of unrealities which once seemed to be substantial enough for grasping. To employ stone, bricks, iron, wood, &c., in order to express one's thoughts and to meet the desires of others would appear at first sight as the reverse of illusory. But, as in most things, there are apparent contradictions about buildings. In architecture we have a combination of what is objective as well as subjective; physical science accepts the control of fancy. It is unnecessary to work out the question in a philosophic sense, although it would not be difficult, for, as the Germans say, a memorial of any kind, so long as it has a structural form, is a *Denkmal*, or, in other words, a form of thought. It will, however, be preferable to glance at illusions in another way.

Let us start with the architect's pupil. In the majority of cases he has only the vaguest notions about the career to which his parents or guardians have devoted him. He may have read a little about the wonders of architecture, or may have attended popular lectures in which the great buildings of the world were described. It is natural he should come to the conclusion that his pleasant vocation will be to erect structures of the same kind, and which apparently can be done without extraordinary difficulty by builders and their workmen under his directions. Here is the first illusion. It only requires a short experience in an architect's office in order to discover that the creative faculty, assuming it to exist, is exercised in a very prosaic manner. The plans and sections he may be set to trace, or the documents he is asked to copy, have to his mind little that is imaginative, and it is not long before a sense of disappointment comes over him. A pupil who has an undoubted talent for art is more likely to suffer through the humdrum procedure than one who has no special aptitude for it in any form, and who joins an architect's office in the same spirit as he would become an apprentice in a commercial house. The history of the late WILLIAM MORRIS affords a revelation of what has to be undergone by pupils who are really eligible. When he entered Mr. STREET's office Mediæval art and poetry appeared to him to be two phases of the same inspiration, and he may have imagined that he could better express himself in architectural forms, including painting and sculpture, than by words alone. He could not at the time have selected a more suitable office for a young Christian enthusiast than Mr. STREET's. But the ordinary routine was too much for him, and his pupilage was never completed. He did not abandon architecture, for it exerted influence over him throughout his life, in his poetry as in his decoration, but he concluded that such knowledge of it as he and others sought after was to be attained by a very different process. MORRIS's illusion about architecture as a practice was dispelled. He no doubt suffered when the idol appeared as a figure of clay, but he was sound enough to recover, although he continued to grumble. Many pupils, from not possessing MORRIS's means, are obliged to act differently. They discover that practical architecture is very unlike the art their fancy created for them, but they have to make the best of their fate, and they will meet with plenty of practitioners to assure them there are other disappointments awaiting them which are still harder to endure.

A pupil, it will be said, must encounter much that is disagreeable in all classes of business as well as in architecture. But once that ordeal is over the opportunities of carrying out the teaching he has obtained will be found to be more remote for the young architect than for the majority of those belonging to the other classes of business.

It is not sufficient for him to be competent to design buildings; he has to convince men that he has power, and that the expenditure of what will be considered as large sums of money can be entrusted to him. Those who have dreamed that it is only necessary to hire an office and have a name engraved on a brass plate, or set up on a painted slip in the hall of an office building, will find that a mere announcement is not persuasive enough to bring clients. There are no more dazzling illusions than those which arise when the time comes for setting up in practice, and the smart which follows experience of their collapse does not easily pass away. Lawyers and medical men in a similar position are fond of saying that the architect has in public competitions one advantageous means of gaining attention of which they are deprived. They would not speak so lightly if they could have a trial of a competition. That system has proved beneficial to many a young architect; but to make it profitable it is usually needful to treat competitions in periods, and to judge of the results of several rather than by taking one as a test. Indeed, it rarely happens that his first competition is successful for an architect. But whatever may be the fate of his first competitive design, the author is certain to have assured himself that he is bound to win. The discovery that he is not the greatest of the unknown architects is a serviceable lesson, but it is always a bitter one.

What, however, is harder to endure is the winning of a prize in a competition, and then to find that beyond the moderate sum which is gained no other advantage is likely to follow. How many architects who daily pass by the Royal Exchange have heard of WILLIAM GRELLIER? Yet it was to him the first premium was awarded in the competition of 1839. He would have been justified in indulging in the illusion that after erecting so important a building he was certain to be recognised as one of the foremost architects. But with the exception of an insurance office in Liverpool it would now be hard to name a work which he designed. The competition for the Government offices in Parliament Street was another instance of prizemen being passed over, and who failed to reach the heights to which they must have believed they were destined. A third instance was the Law Courts competition, which seemed to have taken place in order to disappoint many able men. The young competitor should therefore remember that unless he hardens his mind he is only running the chance of creating sorrow for himself when he enters on a contest. For that reason it is advisable to take part in as many students' competitions as possible; for a confiding youth cannot begin too early inuring himself to disappointments. Imagination and susceptibility usually go together, and those who may seem to their friends to be stoical have often felt more deeply the failure of their attempts.

Apart from competitions, the difficulty of securing commissions will to many people appear as incredible. Take for example, one of the men who were selected to struggle for the Law Courts. EDWARD BARRY's design was considered to be equal to GEORGE EDMUND STREET's. When it was found that the two men who were declared to be the most successful would not agree to co-operate, EDWARD BARRY received as compensation the commissions which were to arise out of the improvement of the National Gallery. It was a futile boon, for the works which were undertaken under his superintendence were of no consequence. But this recognition of BARRY's ability was without avail in bringing him clients of another kind, and for a man who started under such favourable circumstances his works, public or private, are not an encouragement to others who do not inherit a great name in architecture.

There was a time when even Sir CHARLES BARRY was not regarded as equal as an artist to CHARLES COCKERELL. As the son of an architect, and as a trained assistant, the latter was able to derive the fullest benefit from his studies in Greece and Italy. But high as is COCKERELL's reputation, it is not based on a large number of buildings. Many of his contemporaries would have admitted his right to a foremost place in the profession, and when he returned to England he was to be excused for indulging in day dreams about what he was to accomplish. COCKERELL was permitted to occupy his leisure, like a student of the French Academy, in restoring on paper the great works of antiquity, and he might create as many panorami-

views as he pleased of ancient cities in order to display his knowledge of architecture. But the public were not to be caught by his scholarship or good taste, and his reputation among foreigners was rather a handicap on him. COCKERELL was infinitely more fortunate in a professional sense than the master who inspired him with the love of the essential beauty of Greek architecture. GEORGE MADDOX taught him as well as DECIMUS BURTON and other successful architects, but nobody can discover the humblest building which was entrusted to the master. He is stated to have excelled the best of his pupils, but his skill was of no account in the eyes of the public. About the time COCKERELL came back to England JOHN SINNELL BOND set out for Greece and Italy. He had gained the Academy gold medal some years earlier, and had exhibited designs which were never executed. But he was obliged to help as a ghost in subsequent years, and of those who imitate CANOVA in praising Waterloo Bridge few are aware that its architectural effect is not to be credited to JOHN RENNIE but to JOHN BOND. It would be easy to bring parallel cases of frustration of hopes out of the experience of a later time as well as from what takes place in our day. But enough has been said to make it evident that success does not always follow either ability or laborious exertion in architecture, and on that account it is not wise to over-indulge in illusions.

November is generally taken to be the commencement of the year for the novice in architecture, and a great many who hope to follow architecture as a profession are now eager for the time to come when they can contend on an equal footing with men who are older as well as with those who are the same age as themselves. To their ardent minds the struggle may appear to be much easier than it will be found; but if they desire to be successful they must prepare themselves and be armed at all points, or otherwise they will have to feel that defeat is merited, and that their illusions were never justified.

MEDIÆVAL LONDON.*

IF MACAULAY's New Zealander were to antedate his visit and take up his position on the parapet of London Bridge he would see very little which belonged to Mediæval London. Let the air be clear of fog, he might have a glimpse of the Tower and one or other of the Southwark churches; but it would be necessary for him to perambulate a great many streets before he could discover evidence of what London was like prior to the Reformation. Soon after that great event the old landmarks began to give place to other structures. Outside of the city a new region was created, and a class of people arose who did not care much for the old place. The Great Fire in its turn removed much that was ancient, and then the city began to assume its present character, and was looked upon as a place of business rather than as an abode of men and women who could claim to be of higher rank than the trading classes.

It must be confessed, however, that Mediæval London continues to sound well in the ears of Englishmen. Romance has surrounded it with an interest which the historian could not attain. In spirit we can still walk through its narrow streets with overhanging houses, take part in its sports, share in its feasts and enjoy the spectacle of the variously-clad strangers who came to it as to a second Venice. But for anyone who would seek to revivify London as it was the task is of extreme difficulty. PETER CUNNINGHAM took only a partial view, and yet his "Handbook" required no less than seven years' toil for its preparation. JOHN TIMES, who modestly sought for information of an unambitious kind in byways rather than in highways, said his "Curiosities of London" occupied him for twenty-seven years, and that, moreover, he received much aid from fellow students who had also tried to realise the old conditions of the great Metropolis. In the latest book by the Rev. W. BENHAM and Mr. CHARLES WELCH we only have an attempt to present an outline sketch of the old city. But as both the authors, through official and other reasons, have long taken an interest in all
